Dr. Joseph Moshe tried to warn people but got arrested (and probably ended up in a mental hospital).

Also Ukrainian happenings are most alarming and weird.
##

Here a little something other as an example:

"Who has been developing infertility vaccines since 1974? The answer is WHO.

"In 1998 a Patent Application was made for a system which uses a person's own immune system to render them permanently infertile, sterile, unable to have children. The system is irreversible, once injected." (See Squalene: Be Very Afraid Part I)

SPIEGEL International

Benjamin Bidder

Pest-Panik in Russlands Provinz

Spiegel, 6 December 2009, 09.18 Uhr
http://www.spiegel.de/wissenschaft/medizin/0,1518,665238,00.html

Schulen werden geschlossen, der Bischof lässt Messen lesen - 30 Todesfälle wegen Schweinegrippe haben in einer russischen Wolgastadt Panik ausgelöst. Verschwörungstheorien machen die Runde, angeblich würden Behörden die viel schlimmere Wahrheit verschweigen: Die Pest sei da.

Wieder klingelt das Telefon des Chefredakteurs der "Neuen Zeitung" in der Wolgastadt Saratow. Wieder hat Alexander Burmistrow einen aufgeregten Anrufer am Telefon. "Wir bekommen ständig Anrufe von besorgten Bürgern", erzählt der Journalist. Viele berichten ihm jetzt von merkwürdigen Lastern, die durch die Straßen der Stadt fahren. Es seien schwere Tankwagen, berichten die Informanten. Sie verspritzten eine Flüssigkeit - vielleicht gegen die ? Oder vielleicht gegen Schlimmeres?

Furcht hat die 800.000 Einwohner der Stadt Saratow ergriffen. Angst vor der Epidemie, vor allem aber Angst davor, dass ihnen die Behörden die Wahrheit verschweigen. Sie fürchten, dass eine schlimmere Krankheit als die Schweinegrippe hinter den Todesfällen steht: die Pest.

Impfstoff

Schulen bleiben geschlossen, man meidet Menschenansammlungen, Geschäfte, Konzerte. Abends um 8 Uhr sind die Straßen wie leer gefegt. Der Gouverneur Itapow besucht demonstrativ eine Apotheke, vor den Fernsehkameras lässt er sich Grippepräparate reichen. Er habe sich auch schon impfen lassen, verkündet der Provinzfürst. Wenn aber die normalen Bürger in die Apotheke gehen, müssen sie feststellen, dass es für sie keine Medikamente gibt. Der bleibt knapp. Dann meldet das städtische Gesundheitsamt Mitte der Woche 466 bestätigte Fälle von Schweinegrippe. Und 30 Tote, die meisten davon junge Leute, ohne Vorerkrankungen. Es sind viele Frauen darunter.

Das Mobilfunknetz bricht zusammen

Gerüchte verbreiten sich wie Lauffeuer. Die Stadt solle abgeriegelt werden. Die Luftwaffe werde Einsätze fliegen, die Stadt werde aus der Luft "desinfiziert". Und Iwan P., 22, Medizinstudent, tippt verhängnisvolle Zeilen in seinen Blog: "Die Ergebnisse der Obduktion jener Saratower, die an der Schweinegrippe gestorben sind, ähneln den Beschreibungen in der medizinischen Literatur über die Resultate der Obduktion von Patienten, die an der Lungenpest gestorben sind." Geht der schwarze Tod um in Saratow?

Aus der Sorge wird Panik. Das Mobilfunknetz bricht zusammen, weil Tausende Einwohner gleichzeitig Ärzte und Behörden sprechen wollen. Beim städtischen Gesundheitsamt gehen massenhaft Anrufe ein. Die Krankenhäuser sind überfüllt, in den Polikliniken bilden sich Schlangen. Ratschläge machen die Runde, man solle nur abgekochtes Wasser trinken oder zum Zähneputzen verwenden. Und Hunderte Bürger schreiben an Präsident Dmitrij Medwedew: "Uns beunruhigt die enorme Anzahl von Todesfällen junger Leute mit der Diagnose 'Lungenentzündung'", heißt es in dem Brief.

Die Dementis der Behörden klingen wütend. "Verbrecherisch" nennt der Chef des föderalen Gesundheitsamtes in Moskau, Gennadi Onischenko, die Vorgänge in der Wolgastadt. Man habe es offenbar mit einer Verschwörung zu tun. "Welche Ziele verfolgt werden, dass weiß ich nicht, und ich will es auch nicht wissen", schäumt Russlands oberster Arzt. Es handle sich ohne Zweifel um "eine zielgerichtete Provokation", sagt Onischenko der Zeitung "Iswestia".

Russlands

Dabei trauen Bürger schlicht ihren Behörden nicht mehr über den Weg. Saratow werde nicht geschlossen, beeilt sich der Leiter des Gesundheitsamts der Stadt, Alexej Danilow, zu betonen. "Von der Pest kann nicht die Rede sein."

Die Menschen glauben ihm nicht mehr. Denn zu oft wurde ihnen in der Vergangenheit nicht die Wahrheit gesagt. So zum Beispiel die Beteuerungen der russischen Staatsanwaltschaft, der angeblich von Piraten gekaperte Frachter "Arctic Sea" sei lediglich "mit Holz und Brettware beladen" gewesen. Oder die Aussage von Wladimir Putin im August 2000, Russland verfüge selbst über die nötige Technik, um das gesunkene Atom-U-Boot Kursk zu bergen. Alle Seeleute seien durch Explosionen sofort ums Leben gekommen, versicherte man damals den schockierten Angehörigen. Die Matrosen hätten nicht leiden müssen. Tatsächlich hatten mehr als 20 Besatzungsmitglieder zunächst überlebt und waren dann am Grund der Barentssee jämmerlich erstickt.

Zehn Prozent glauben den Medien, zehn den Ärzten, sieben den Beamten

Sicherheitskräfte und Stadtobere verkünden jetzt einen Erfolg im Kampf gegen die vermeintlichen Übeltäter, die Saratow in Aufruhr versetzt haben sollen. Sie haben den Studenten Iwan P. verhaftet. Nach Informationen der Moskauer Zeitung "Kommersant" drohen ihm 200.000 Rubel Strafe - umgerechnet 4500 Euro - oder bis zu zwei Jahren Haft.

Der Bischof von Saratow lässt Messen gegen die Krankheit lesen und versichert, "Gott sende niemanden - nicht dem einzelnen Menschen, nicht einem ganzen Volk - ein Kreuz, dessen Last zu schwer ist zu tragen." Doch das Misstrauen bleibt. Die Zeitung "Wsgljad Info" aus Saratow hat ihre Leser abstimmen lassen. "Wer stellt die vertrauenswürdigsten Informationen über die Schweinegrippe-Epidemie zur Verfügung?" Zehn Prozent glauben den Medien. Zehn auch den Ärzten. Den Beamten? Knapp sieben. Und 65 Prozent der Leser sind davon überzeugt, dass "alle versuchen, den tatsächlichen Umfang der Epidemie zu vertuschen".

Denn Amtsinhaber und Würdenträger sind es nicht gewöhnt, die Öffentlichkeit offen und umfassend zu informieren, es gibt auch kaum einflussreiche Medien, die nicht staatlich kontrolliert werden. Das ist der Boden, auf dem in Russland Verschwörungstheorien besonders gut gedeihen. So glaubt heute laut Umfragen des Meinungsinstitutes WZIOM jeder fünfte Russe, dass es der eigene Inlandsgeheimdienst FSB war, der 1999 mehrere Wohnhäuser in die Luft sprengte - um einen Vorwand für einen Feldzug in der abtrünnigen Teilrepublik Tschetschenien zu haben.

In Saratow machen schon neue Versionen und Gerüchte die Runde. Es könnte einen Zwischenfall im Umland der Stadt gegeben haben. Wurden nicht im Dorf Gornij vor Jahren Chemiewaffen verschrottet?

Aber nicht alle verfallen der Furcht. Ilja Repin, ein junger Geschäftsmann, hat ein T-Shirt entworfen, das er jetzt im Internet vertreibt. Darauf ist ein Flugzeug zu sehen, das Desinfektionsmittel versprüht, und rennende Strichmännchen. "Ich habe die Desinfektion vom 2.12.2009 überlebt" lautet die Aufschrift. Ilja hofft auf die befreiende Wirkung des Humors - und ein bisschen Gewinn. 250 Rubel kostet das T-Shirt. In nur zwei Tagen hat er schon 400 Bestellungen entgegen genommen.

THE FLU CASE

Plague Reported in Russia

The Flu Case, 7 December 2009 13:12
https://web.archive.org/web/20100102020250/http://theflucase.com/index.php?option=com_content&view=article&id=2200%3Aplague-reported-in-russia&catid=41%3Ahighlighted-news&Itemid=105&lang=en

An outbreak of pneumonic plague similar to that recently reported in the Ukraine and Poland has killed at least thirty people in the city of Saratow, reports Germany's Der Spiegel.
Top Russian health official Gennadi Onischenko is reported as saying the outbreak is deliberate and part of a "conspiracy." But he does not know who is behind the action.

This is part of the Spiegel report translated into English.
http://www.spiegel.de/wissenschaft/medizin/0,1518,665238,00.html

Benjamin Bidder, Plague panic in of Russia province. -

Schools are closed, the bishop has masses read - 30 deaths because of the swine flu have triggered panic in a Russian Volga city. Conspiracy theories make the rounds, the authorities are concealing the truth about how bad things are: the plague is here.

The telephone of the editor-in-chief of the "New Newspaper" rings again in the Volga city Saratow. Again Alexander Burmistrow has an excited caller on the other end. "We constantly get calls of anxious citizens", says the journalist. There are many reports of strange vehicles, which drive along roads of the city. They are heavy tankers, report an informant. They sprayed a liquid - perhaps against the swine flu? Or perhaps against something worse?

Fear has seized the 800,000 inhabitants of the city Saratow. Fear of the epidemic: above all, however, fear of the fact that the authorities are hiding the truth from them. They are afraid that a worse illness than the swine flu is causing the deaths: the plague.

Schools remain closed, people avoid groups, business, concerts. In the evening at 8 o'clock the streets have been swept empty. The governor Itapow visited for the TV a pharmacy, before the television cameras he got his flu medication. He has already been vaccinated, announces the provincial prince. If however the normal citizens go into the pharmacy, there are no medicines for them. The vaccine remains scarce. Then public health authorities in the middle of the week announced 466 confirmed cases of swine flu. And 30 deaths, mostly young people, without any illnesses. Many women are among them.

The mobile phone network breaks down

Rumors spread like fires. The city is to be put under quarantine. The Air Force is to carry out missions to disinfect the city from air. And Iwan P., 22, medical student, types doomladen lines into its blog: "The results of the autopsy, which died from the swine flu in Sarantwo, resemble the descriptions in the medical literature of the results of the autopsy of patient that died of the lung plague." Has the black death gone over into Saratow?

Concern turns to panic. The mobile phone network breaks down because thousands of people want to speak to dcotors and authorities at the same time. The public health authorities register huge quantities of calls. The hospitals are overcrowded, in the health centers queues form. Advice makes the round; use only boiled water and only for brushing your teeth. And hundreds of citizens write president Dmitrij Medwedew: “The enormous number of deaths among young people with the diagnosis “pneumonia" worries us” says the letter.

The statements of the authorities sounds furious. “Criminal” says the boss of federal public health authorities in Moscow, Gennadi Onischenko, about the procedures in the Volga city. It is obviously a conspiracy. “What the goals are I do not know, and I want it also to know”, storms Russia highest physician. It is “a deliberate provocation”, Onischenko tells the newspaper “Iswestia”.

The severity of pandemic H1N1 influenza in the United States
from April to July 2009: a Bayesian analysis

PLoS Med. 2009 Dec; 6 (12):e1000207. doi: 10.1371/journal.pmed.1000207.
Epub 2009 Dec 7/8. PMID: 19997612; PMCID: PMC2784967.

Abstract

Background: Accurate measures of the severity of pandemic (H1N1) 2009 influenza (pH1N1) are needed to assess the likely impact of an anticipated resurgence in the autumn in the Northern Hemisphere. Severity has been difficult to measure because jurisdictions with large numbers of deaths and other severe outcomes have had too many cases to assess the total number with confidence. Also, detection of severe cases may be more likely, resulting in overestimation of the severity of an average case. We sought to estimate the probabilities that symptomatic infection would lead to hospitalization, ICU admission, and death by combining data from multiple sources.

Methods and findings: We used complementary data from two US cities: Milwaukee attempted to identify cases of medically attended infection whether or not they required hospitalization, while New York City focused on the identification of hospitalizations, intensive care admission or mechanical ventilation (hereafter, ICU), and deaths. New York data were used to estimate numerators for ICU and death, and two sources of data--medically attended cases in Milwaukee or self-reported influenza-like illness (ILI) in New York--were used to estimate ratios of symptomatic cases to hospitalizations. Combining these data with estimates of the fraction detected for each level of severity, we estimated the proportion of symptomatic patients who died (symptomatic case-fatality ratio, sCFR), required ICU (sCIR), and required hospitalization (sCHR), overall and by age category. Evidence, prior information, and associated uncertainty were analyzed in a Bayesian evidence synthesis framework. Using medically attended cases and estimates of the proportion of symptomatic cases medically attended, we estimated an sCFR of 0.048% (95% credible interval [CI] 0.026%-0.096%), sCIR of 0.239% (0.134%-0.458%), and sCHR of 1.44% (0.83%-2.64%). Using self-reported ILI, we obtained estimates approximately 7-9 x lower. sCFR and sCIR appear to be highest in persons aged 18 y and older, and lowest in children aged 5-17 y. sCHR appears to be lowest in persons aged 5-17; our data were too sparse to allow us to determine the group in which it was the highest.

Conclusions: These estimates suggest that an autumn-winter pandemic wave of pH1N1 with comparable severity per case could lead to a number of deaths in the range from considerably below that associated with seasonal influenza to slightly higher, but with the greatest impact in children aged 0-4 and adults 18-64. These estimates of impact depend on assumptions about total incidence of infection and would be larger if incidence of symptomatic infection were higher or shifted toward adults, if viral virulence increased, or if suboptimal treatment resulted from stress on the health care system; numbers would decrease if the total proportion of the population symptomatically infected were lower than assumed.

Severity of H1N1 Flu in U.S. during current Flu season may be less than Feared: Press Releases

Harvard, HSPH, 7 December 2009
https://web.archive.org/web/20100419073527/http://www.hsph.harvard.edu/news/press-releases/2009-releases/severity-h1n1-flu-us-current-flu-season-may-be-less-than-fea.html

Burden of disease may fall on young children and non-elderly adults.

Boston, MA – A new study from researchers at the UK Medical Research Council and the Harvard School of Public Health (HSPH) projects that the severity of the H1N1 flu during the autumn-winter flu season in the U.S. will likely be less than previously feared. The estimates of hospitalizations and life-threatening events in the study are the most accurate to date of the H1N1 pandemic's impact in the U.S. The study appears online on December 7, 2009 in the journal PLoS Medicine.

"As more detailed data have become available, we have been able to improve our estimates of how severe this disease is. Early on, it was difficult to measure the flu's impact and it was crucial to plan for the full range of possible outcomes. Fortunately, the virus now appears to be near the milder end," said Marc Lipsitch, professor of epidemiology at HSPH and the study's senior author. Lipsitch heads the Center for Communicable Disease Dynamics at HSPH, which focuses on mathematical modeling and analysis of data on pandemic influenza, drug resistant infections, seasonal infectious diseases, and intervention allocation. The Center is funded through the National Institutes of Health's Models of Infectious Disease Agent Study (MIDAS), which is aiming to increase capacity to model disease spread, evaluate different intervention strategies, and help inform public health officials and policymakers.

While the news is better than was thought at the start of the pandemic, Lipsitch emphasizes that it remains important to continue to vaccinate against pandemic H1N1 and to remain vigilant about disease in groups at risk of complications. "This is a serious disease," said Lipsitch. "The U.S. Centers for Disease Control (CDC) and others have shown that certain high-risk groups, including pregnant women, people with asthma, and people with compromised immune systems, should be vaccinated and should seek prompt treatment if they suspect they are sick with H1N1. Even for people outside these high-risk groups, vaccination is an important way to reduce the risk of what can be a serious illness."

Estimates of the H1N1 flu's severity are important because they help public health officials plan for the types of interventions that are needed to treat symptoms, including life-threatening respiratory situations, and help officials project the possible burden on the health care system.

"Providing unbiased estimates to gauge the severity of the flu pandemic is crucial in order for local health services to be able to plan their resources properly and deliver the best level of care possible. Our study was careful to account for uncertainty in the evidence and analyze the different ways severity of the illness is being measured," said first author Anne Presanis of the Medical Research Council Biostatistics Unit in Cambridge, UK.

Up until this point, the severity of H1N1 flu among the U.S. population had been hard to measure, partly due to the difficulties of counting the large numbers of cases that overwhelmed health authorities and of testing the large numbers of people that had symptoms. The World Health Organization counts 209,000 laboratory-confirmed cases and more than 3,205 deaths worldwide as of September 11, 2009, but health authorities worldwide believe that these are substantial underestimates.

The researchers, led by Presanis and Lipsitch, measured the severity of the pandemic by analyzing what fraction of people in the study population that were sick with H1N1 flu were (1) hospitalized, (2) in an intensive-care unit (ICU) or on a ventilator or (3) had died. They analyzed data from the CDC and from New York and Milwaukee, two cities where health officials collected particularly high-quality surveillance data during the wave of infections from April to July 2009. The researchers then combined all the evidence using a statistical approach called Bayesian evidence synthesis to estimate the probability of the three outcomes above for individuals who fell ill with H1N1 in the overall U.S. population and by age group.

The researchers used two different approaches to estimate these risks. One approach led to an estimate that approximately 1.44% of patients with symptoms of H1N1 flu during the April-July time period were hospitalized, 0.239% required intensive care or mechanical ventilation and 0.048% died. The other estimate found probabilities 7 to 9 times lower, due to the use of different data to estimate how many individuals were sick. Based on these findings and assuming that the virus doesn't change its characteristics, the researchers estimate that the severity of the autumn-winter pandemic wave of H1N1 flu could have a death toll in a range from considerably below the estimated 36,000 associated with an average flu season in the U.S. to slightly higher. Also, unlike seasonal flu, which kills mainly elderly adults, the H1N1 flu could have the greatest impact in children aged 0-4 and especially adults 18-64, a shift toward nonelderly persons that has been seen in prior flu pandemics.

"The good news is that, along with previous work by the CDC and others, our work shows that the severity of the H1N1 flu may be less than initially feared," said Lipsitch. However, he adds that between 1 in 70 and 1 in 600 people who are sick with the illness will be hospitalized, and a fraction of those will die.

A preliminary version of this article was posted on PLoS Currents (September 25th 2009), a new forum for rapid publication of results designed to aid timely dissemination of important information during the pandemic.

Support for the study was provided by the UK Medical Research Council, the UK Health Protection Agency, the U.S. National Institutes of Health and Department of Homeland Security.

Fall in swine flu cases may not signal an end of the epidemic, warns Professor Donaldson

BMJ, 7 December 2009; 339: b5329; doi:10.1136/bmj.b5329
http://www.bmj.com/cgi/content/full/339/dec07_1/b5329

England's chief medical officer has said it is too early to know whether the "striking reduction" in numbers of new swine flu cases would continue in weeks ahead, and warned there may be a rise of infections among older people after Christmas.

The number of new cases of swine flu among adults halved in England in the week to 3 December to 22 000 new cases from 46 000 in the previous week, said Professor Sir Liam Donaldson.

However, the under 5s, the group worst hit by the swine flu so far, continue to be admitted to hospital. They have high levels of respiratory illness, which could also be caused by respiratory syncytial virus, said Professor Donaldson.

GP representatives are currently negotiating with the Department of Health the details of payments for the next priority group in the swine flu vaccination programme, children under 5 years old.

Ian Dalton, the national director for NHS Flu Resilience, told a press briefing on 3 December that there was still no agreement with GPs over payments for immunising all children between 6 months and under 5 years, but that he hoped there would be an agreement very soon. The vaccination programme was likely to be rolled out in stages across the country.

Professor Donaldson also expressed concern about the continuing deaths from swine flu and the high rate of hospitalisations despite low levels of the disease in the community.

The death toll has reached 270 in the United Kingdom and there are still 1000 people in hospital.

Professor Donaldson said, "We are not claiming victory because there are too many things to worry about. I won't be confident until March to say it's all over for this winter because in the 1957-8 pandemic we saw a further peak after Christmas among older adults and with seasonal flu we often see a peak in the New Year."

The vaccination programme for the priority groups and healthcare workers is progressing well, he said. An estimated 1.6 million doses have now been given out in England, a rise of 600 000 in the past week.

So far 275 000 health workers have had the vaccination out of two million being targeted, which is more than double the number that were given seasonal flu vaccine last year.

David Salisbury, director of immunisation at the Department of Health, was also cautious. He said, "We have no way of knowing what will happen with seasonal flu early next year and what the pandemic virus might do, especially as immunity expands in the population, which may force the swine flu virus to drift. It makes us very cautious."

CBSNEWS

Obama Administration Releases H1N1 Ads

CBS News, 7 December 2009, 7:30 AM EST
https://www.cbsnews.com/news/obama-administration-releases-h1n1-ads/

Pushing Americans to receive H1N1 (swine) flu vaccinations, the Obama administration on Monday released a new slate of television and radio ads to counter an illness that already has infected millions.

The public service announcements target children and their parents, young adults and those in high-risk groups, such as people with asthma. The ads in English and Spanish come as a shortage of the vaccine is easing, with another 10 million doses expected to become available this week. The messages also are a shift from earlier efforts to teach Americans how to avoid spreading the illness, known also as H1N1.

Health and Human Services Secretary Kathleen Sebelius announced the new ads Monday.

"Getting vaccinated is the best way to protect yourself and your family against the H1N1 flu virus," Sebelius said. "Fighting the flu is a shared responsibility and it is up to all of us to help prevent the spread of the flu in your community."

CBSNews.com Special Report: H1N1 Virus

The U.S. Centers for Disease Control and Prevention estimates that 22 million people have been infected with swine flu in the United States and 3,900 have died. Government tallies also include 98,000 swine flu-related hospitalizations.

The vaccine is becoming plentiful enough that some state and local governments are allowing everyone to get it, not just those in priority groups. There are 73 million doses available, roughly twice as many as there were a month ago, and another 10 million doses are expected this week, Dr. Thomas Frieden, the CDC's director, told reporters Friday.

New Ad Campaign Pushes H1N1 Flu Vaccinations

Fox News, 7 December 2009, 9:17am EST
https://www.foxnews.com/story/new-ad-campaign-pushes-h1n1-flu-vaccinations

Pushing Americans to receive swine flu vaccinations, the Obama administration on Monday released a new slate of television and radio ads to counter an illness that already has infected millions.

The public service announcements target children and their parents, young adults and those in high-risk groups, such as people with asthma. The ads in English and Spanish come as a shortage of the vaccine is easing, with another 10 million doses expected to become available this week. The messages also are a shift from earlier efforts to teach Americans how to avoid spreading the illness, known also as H1N1.

Health and Human Services Secretary Kathleen Sebelius was announcing the new ads Monday.

"Getting vaccinated is the best way to protect yourself and your family against the H1N1 flu virus," Sebelius said. "Fighting the flu is a shared responsibility and it is up to all of us to help prevent the spread of the flu in your community."

The Centers for Disease Control and Prevention estimates that 22 million people have been infected with swine flu and 3,900 have died. Government tallies also include 98,000 swine flu-related hospitalizations.

The vaccine is becoming plentiful enough that some state and local governments are allowing everyone to get it, not just those in priority groups. There are 73 million doses available, roughly twice as many as there were a month ago, and another 10 million doses are expected this week, Dr. Thomas Frieden, the CDC's director, told reporters Friday.

Initially, limited supplies caused the CDC to advise state and local health officials to reserve doses for those at highest risk for severe complications from swine flu or those who take care of them.

Officials at the CDC said last week that it appears that a fall wave of swine flu infections has peaked. But flu is hard to predict, and health officials say they are worried of the possibility of a third wave this winter.

"Right now, Americans have a window of opportunity to get vaccinated," Sebelius said.

The new ad campaign features five television spots, including two targeting young Americans who are especially susceptible to the flu. Another three radio ads are available.

Has Swine Flu Been Oversold?
If you warn of a pandemic but stop it, do you get credit?

ABC News, 8 December 2009, 2:20 AM
https://abcnews.go.com/Health/SwineFluNews/swine-flu-blown-proportion/story?id=9270149

Dec. 8, 2009. – A new analysis, using H1N1 deaths in the United States in the spring and projecting likely outcomes for this fall, shows that a typical -- or possibly even a milder flu season than average – should have been expected.

The finding begs the question: Has swine flu been oversold?

The new study, done by researchers at Harvard University and the Medical Research Council Biostatistics Unit in the U.K., says swine flu cases in the spring indicated a flu season that might be, at worst, slightly worse than normal.

"It would have been great to have that back in June," said Philip Alcabes, an associate professor in the program in urban public health at Hunter College's School of Health Sciences. "There would have been one more bit of evidence behind my assertion six months ago" that people were overreacting to H1N1.

He added, "I'm not saying they could have done that [analysis] even faster."

Around the time that swine flu first started making headlines, Alcabes' book, "Dread: How Fear and Fantasy Have Fueled Epidemics From the Black Death to Avian Flu," was published, and he said the circumstances surrounding H1N1 provide an apt case study.

"I think that it was, from the very beginning, created as a crisis and overstated as a real threat," he said, adding that he did not want to understate the seriousness of influenza.

"Flu is a serious illness, it kills people," he said. But, he added, "It does a disservice to public health when, in the name of a preparedness crusade, people create a narrative of crisis or catastrophe before we have enough data that this is happening."

Alcabes said that while public officials, in the early going, admitted to having little data on the virus and resisted calls to close the borders. But as time went on, he said, officials took many steps he feels were unnecessary, including mass, rather than targeted vaccination.

While the new paper suggests swine flu was unlikely to create a severe epidemic, the researchers, disagreeing with Alcabes, say they do not think public health officials overreacted.

"In the early on, we would not have been able to estimate severity. We were going with what was known at the time," said Anne Presanis, a statistician with the Medical Research Council Biostatistics Unit.

Victims of Success?

Dr. William Schaffner, chairman of preventive medicine at Vanderbilt University Medical Center, said he did not believe public health officials were overreacting.

"I don't think it's been oversold," he said. "I think you have to prepare for the worst and then be gratified that it wasn't as bad as it was."

While H1N1 affected different age groups from a typical flu, the intensity of that difference was not yet known in the spring.

"When it first hit, nobody knew how severe it could be or that population aged 60 and over would be relatively spared," said Schaffner. "Had this virus had an impact in the age 60 or over, it would have been vastly more injurious than seasonal influenza. We were fortunate in that regard, but we didn't know that at the time."

Public health officials faced a tough choice in May and June, said Robert Field, a professor of health management and policy at the Drexel University School of Public Health. Had they done little and an epidemic occurred, they would have been blamed for doing nothing. If they did a lot and there had been no major outbreak -- or even if their efforts stopped a potential outbreak – they would have been blamed for wasting money.

"The attitude of public health is better to be safe than sorry, and to some extent, we may be seeing a milder epidemic than we feared because of the vaccine and other measures people are taking," Field said. "It's so easy to be a victim of your own success -- no one ever sees the disease that's being prevented, you just see the one that appeared and then got cured. It's a consequence of any disease that you develop a vaccine for and more broadly, of any disease that you're able to prevent."

The Future of Preparedness

It is not clear how H1N1 will act in the coming months. While swine flu cases have hit their peak, public health officials are saying they expect another peak of influenza in winter, around the time when flu season typically peaks

On the East Coast, the winter cold has just settled in, so it is unclear what effect that will have on swine flu numbers.

"I am concerned that as more H1N1 vaccine arrives, people won't be as motivated to spend the time and energy to get it," said Schaffner. "We'll begin to see the vaccine left in the refrigerator while the virus continues to get people sick. H1N1 seems to persist because so many people are susceptible."

Such a phenomenon is typical for flu season, where vaccination peaks before Thanksgiving, but the majority of cases come in January and February.

"We're now beginning to enter the period of time of the regular seasonal influenza viruses," said Schaffner, explaining that he expects a mix of seasonal flu and H1N1, but is not sure of the proportions.

"I'm a little unsure of the relative proportions."

Schaffner does not believe that current responses will hurt the credibility of public health officials in the future.

"I would not think so," he said. "This has been an illness that has been pretty widespread throughout the country. Almost everyone knows someone who has been affected."

But Alcabes said while he does not know how people will respond to the directives of public health officials in the future, he thinks it is a concern.

"This was mild, and that's no relief to the families of people who died from it," he said."One feels terrible for them, but people do die of flu. People die from flu every year."

Because we do not yet know what will happen as flu season continues, Field noted, it is probably too early for Monday-morning quarterbacking.

"The game isn't over yet, it seems to be waning, but we don't know for sure," he said. "You could say it's not over till it's over."

Schweinegrippe: Patientin nach Impfung mit H1N1-Virus infiziert
"Ich war selbst erschrocken", sagt ihr Leipziger Arzt zu bild

BILD, 9 December 2009
https://www.bild.de/regional/leipzig/patientin-nach-impfung-mit-virus-infiziert-10755896.bild.html

Der Leipziger Allgemeinarzt Dr. Lothar Markus (60) berichtet jetzt erstmals von einem solchen Fall. Am 12. November habe er einer Patientin (39) eine Dosis des Schweinegrippe-Impfstoffs " Pandemrix" geimpft. 20 Tage später sei sie wieder in seine Praxis gekommen. Der Arzt: "Sie klagte über starke Kopf- und Gliederschmerzen, hatte 39,5 Grad Fieber. Typische Grippe-Symptome!"

Der Mediziner machte sofort einen Nasenabstrich und veranlasste einen H1N1-Test in der Virologie der Universität Leipzig. Das Ergebnis bekam er noch am gleichen Tag per Fax – es war positiv! Dr. Markus: "Ich war selbst erschrocken. Denn das bedeutet, dass eine mit Pandemrix geimpfte Person nicht vor dem Virus H1N1 gefeit ist."

Ralph Schreiber, Sprecher des Sächsischen Gesundheitsministeriums, vermutet eine unglückliche Zeitüberschneidung: "Die Immunität ist erst drei Wochen nach einer Impfung richtig aufgebaut, vermutlich hat sich die Patientin vorher angesteckt."

Damit will sich Dr. Markus nicht zufrieden geben. "Viele Schweinegrippe-Erkrankungen werden nicht erkannt, weil Ärzte nach einer Impfung keine Infektion vermuten", befürchtet er und fordert jetzt in einem Schreiben an das Robert-Koch-Institut (RKI), die Wirksamkeit von Pandemrix zu prüfen: "Möglich, dass eine einmalige Impfung nicht reicht."

RKI-Sprecherin Susanne Glasmacher: "Solche Fälle sind durchaus denkbar. Kein Medikament ist einhundertprozentig wirksam."

THE FLU CASE

Woman gets Swine Flu after pandemrix jab

The Flu Case, 15 December 2009
https://web.archive.org/web/20100102031801/http://theflucase.com/index.php?option=com_content&view=article&id=2300%3Awoman-gets-swine-flu-after-pandemrix-jab&catid=1%3Alatest-news&Itemid=64&lang=en

A woman in Germany who got the Pandemrix swine flu jab developed swine flu 20 days later.

The woman developed severe head ache, a 39.5 degree fever and aches in her limbs. Her doctor Dr Lothar Markus sent a sample to the virology lab in the University of Leipzig, which reported that the 39-year-old woman had developed swine flu.

It is not clear whether the vaccine was the cause of the woman getting the swine flu virus.

Mortality from pandemic A/H1N1 2009 influenza in England:
public health surveillance study

BMJ, 10 December 2009; 339: b5213; doi: 10.1136/bmj.b5213
https://www.bmj.com/content/339/bmj.b5213

Abstract

Objective To establish mortality from pandemic A/H1N1 2009 influenza up to 8 November 2009.
Design Investigation of all reported deaths related to pandemic A/H1N1 in England.
Setting Mandatory reporting systems established in acute hospitals and primary care.
Participants Physicians responsible for the patient.

Main outcome measures Numbers of deaths from influenza combined with mid-range estimates of numbers of cases of influenza to calculate age specific case fatality rates. Underlying conditions, time course of illness, and antiviral treatment.

Results With the official mid-range estimate for incidence of pandemic A/H1N1, the overall estimated case fatality rate was 26 (range 11-66) per 100 000. It was lowest for children aged 5-14 (11 (range 3-36) per 100 000) and highest for those aged ≥65 (980 (range 300-3200) per 100 000). In the 138 people in whom the confirmed cause of death was pandemic A/H1N1, the median age was 39 (interquartile range 17-57). Two thirds of patients who died (92, 67%) would now be eligible for the first phase of vaccination in England. Fifty (36%) had no, or only mild, pre-existing illness. Most patients (108, 78%) had been prescribed antiviral drugs, but of these, 82 (76%) did not receive them within the first 48 hours of illness.

Conclusions Viewed statistically, mortality in this pandemic compares favourably with 20th century influenza pandemics. A lower population impact than previous pandemics, however, is not a justification for public health inaction. Our data support the priority vaccination of high risk groups. We observed delayed antiviral use in most fatal cases, which suggests an opportunity to reduce deaths by making timely antiviral treatment available, although the lack of a control group limits the ability to extrapolate from this observation. Given that a substantial minority of deaths occur in previously healthy people, there is a case for extending the vaccination programme and for continuing to make early antiviral treatment widely available.

We want raw data, now

BMJ, 10 December 2009, 339: b5405; doi: 10.1136/bmj.b5405
https://www.bmj.com/content/339/bmj.b5405

This week's *BMJ* is dominated by a cluster of articles on oseltamivir (Tamiflu):
- doi:10.1136/bmj.b5351, doi:10.1136/bmj.b5387, doi:10.1136/bmj.b5106,
- doi:10.1136/bmj.b5164, doi:10.1136/bmj.b5248, doi:10.1136/bmj.b5364.

Between them the articles conclude that the evidence that oseltamivir reduces complications in otherwise healthy people with pandemic influenza is now uncertain and that we need a radical change in the rules on access to trial data.

Briefly, in updating their Cochrane review, published this week (doi:10.1136/bmj.b5106), Tom Jefferson and colleagues failed to verify claims, based on an analysis of 10 drug company trials, that oseltamivir reduced the risk of complications in healthy adults with influenza. These claims have formed a key part of decisions to stockpile the drug and make it widely available.

Only after questions were put by the *BMJ* and *Channel 4 News* has the manufacturer Roche committed to making "full study reports" available on a password protected site. Some questions remain about who did what in the Roche trials, how patients were recruited, and why some neuropsychiatric adverse events were not reported. A response from Roche is published in our letters pages (doi:10.1136/bmj.b5364) and their full point by point response is published online (doi:10.1136/bmj.b5374).

Should the *BMJ* be publishing the Cochrane review given that a more complete analysis of the evidence may be possible in the next few months? Yes, because Cochrane reviews are by their nature interim rather than definitive. They exist in the present tense, always to be superseded by the next update. They are based on the best information available to the reviewers at the time they complete their review. The Cochrane reviewers have told the *BMJ* that they will update their review to incorporate eight unpublished Roche trials when they are provided with individual patient data.

Where does this leave oseltamivir, on which governments around the world have spent billions of pounds? The papers in this week's journal relate only to its use in healthy adults with influenza. But they say nothing about its use in patients judged to be at high risk of complications – pregnant women, children under 5, and those with underlying medical conditions; and uncertainty over its role in reducing complications in healthy adults still leaves it as a useful drug for reducing the duration of symptoms. However, as Peter Doshi points out (doi:10.1136/bmj.b5164), on this outcome it has yet to be compared in head to head trials with non-steroidal inflammatory drugs or paracetamol. And given the drug's known side effects, the risk-benefit profile shifts considerably if we are talking only in terms of symptom relief.

We don't know yet whether this episode will turn out to be a decisive battle or merely a skirmish in the fight for greater transparency in drug evaluation. But it is a legitimate scientific concern that data used to support important health policy strategies are held only by a commercial organisation and have not been subject to full external scrutiny and review. It can't be right that the public should have to rely on detective work by academics and journalists to patch together the evidence for such a widely prescribed drug. Individual patient data from all trials of drugs should be readily available for scientific scrutiny.

BMJ Demands Raw Data from Pharma Clinical Trials

AHRP, 10 December 2009
https://ahrp.org/bmj-demands-raw-data-from-pharma-clinical-trials/

The controversy surrounding the frenzied promotion of the drug, Tamiflu (oseltamivir) has exploded in several scientific venues and even in the US and UK media. The controversy may be even more instructive about the systemic issues that undermine the integrity of the drug and vaccine review and analysis process than the Vioxx catastrophe.

This week's BMJ contains six articles detailing the essential issues involved in the Tamiflu controversy: included are independent critics' analyses as well as company counterclaims, and two editorials (excerpts below) that critique the current system which not only fails to detect serious adverse effects, the system allows manufacturers to control the trials and conceal the safety data. Physicians and the public are misled with a false sense of security about the safety and effectiveness of patented drugs and vaccines.

The deception is orchestrated by company marketing masquerading as evidence which prominent industry-paid academic physicians promote as "science-based" information.

For example, a much cited favorable analysis by Kaiser et al (2005) was funded by the drug's manufacturer Roche. The analysis was based entirely on 10 trials funded by Roche: of which only two had been published in peer reviewed journals. All 10 trials were authored by Roche employees and paid academic consultants

The system has provided companies an opportunity to make spectacular profits from the widespread use of defective drugs and vaccines that have caused irreversible harm.

"The current system isn't working. Worse than that, it gives a false sense of security. The system's failures have left a legacy of drug evaluations for which, in the absence of better information, we must assume the same levels of confusion and uncertainty as for oseltamivir. The drug industry directly or indirectly undertakes the majority of all drug evaluations, so most of the evidence used to support drug policy and treatment remains shrouded in secrecy. In only a minority of cases will the data have been subject to full independent analysis and interpretation. In many if not most cases, the only people who have seen the entire dataset are company employees."

See: Editorial, *Why don't we have all the evidence on oseltamivir*?

Indeed, we learn how independent Cochrane Collaboration reviewers were hoodwinked into trusting a company funded meta-analysis of unpublished data–data that was undisclosed to the Cochrane reviewers:

"The previous reviewers endorsed the conclusion that oseltamivir reduces complications such as pneumonia and bronchitis by implicitly trusting that the unpublished data were verifiable. This trust now seems naive. The fact that a trust in unpublished data extends to many systematic reviews of neuraminidase inhibitors by other researchers and was not questioned until… a paediatrician from Japan, Keiji Hayashi, submitted a comment to the Cochrane Collaboration that would ultimately leave us doubtful about the ability of systematic reviews to deal with the challenges of contemporary pharmaceutical evaluation…"

"The previous Cochrane review placed its trust in publications and included Kaiser's unpublished data, but to do so once again, despite our inability to obtain data sufficient to perform an independent analysis, would have shifted our position from that of trust in publication to that of trust in secrecy." The revised review dropped Kaiser's paper from its analysis.

Notwithstanding the positive spin provided by the Kaiser analysis, which concluded that Tamiflu reduces complications, Roche, apparently did not itself make any such claims about complications. A Tamiflu.com webpage reads, "Treatment with TAMIFLU has not been proven to have a positive impact on these outcomes," referring to pneumonia, other respiratory diseases, and influenza related death.

However, a footnote on that website undermines the company's pretense of candor: "THIS [WEB] SITE IS INTENDED FOR U.S. AUDIENCES ONLY."

On its global website, Roche.com, it asserts that "Tamiflu delivers … [a] 67 percent reduction in secondary complications such as bronchitis, pneumonia and sinusitis in otherwise healthy individuals."

BMJ editor, Fiona Godlee, challenges Roche to disclose the drug's complete clinical trial data so that independent scientists can evaluate the actual risk / benefit of the vaccine–on the basis of scientific data, not the hearsay of the manufacturer and its financially compromised scientists.

Her challenge is really directed at the pharmaceutical industry, not just Roche. It gets to the heart of the systemic corruption of science, clinical practice, government healthcare policies that have encouraged system wide fraud.

"We don't know yet whether this episode will turn out to be a decisive battle or merely a skirmish in the fight for greater transparency in drug evaluation. But it is a legitimate scientific concern that data used to support important health policy strategies are held only by a commercial organisation and have not been subject to full external scrutiny and review. It can't be right that the public should have to rely on detective work by academics and journalists to patch together the evidence for such a widely prescribed drug. Individual patient data from all trials of drugs should be readily available for scientific scrutiny."

H5N1 H1N1 Cluster in Dien Bien Vietnam

Recombinomics, 10 December 2009, 03:52
http://www.recombinomics.com/News/12100902/H5N1_H1N1_Dien_Bien.html

More and anxiety on the basis of when Dr. Nguyen Tran Hien, Director of Institute of Hygiene and Epidemiology PRIVATE announce the result of epidemiological investigations deaths due to bird flu recently in Dien Bien. Male patients age 23 in the city of Dien Bien death from respiratory failure due to severe viral pneumonia was confirmed by test results: The patient died from H5N1.

When investigating the epidemiology of close contact with patients, medical experts are concerned when they discovered the children of influenza A/H1N1 infected patients. Meanwhile, the Forum chickens living in the cousin has test results positive for H5N1 virus.

The above translation suggests a family in Dien Bien, Vietnam has tested positive for H5N1 and H1N1. Poultry belonging to the family has also tested positive for H5N1.

Vietnam represents a hot zone where H1N1 and H5N1 are co-circulating. H1N1 is very promiscuous and has been isolated from a variety of mammalian species as well as turkeys. Thus, Vietnam would offer an environment for co-infections in a wide range of host including human.

CDC sharply raises H1N1 case estimates; kids hit hard

CIDRAP, 10 December 2009
https://www.cidrap.umn.edu/h1n1-2009-pandemic-influenza/cdc-sharply-raises-h1n1-case-estimates-kids-hit-hard

Dec 10, 2009 (CIDRAP News) – Another month's worth of data on H1N1 influenza has led federal officials to more than double their estimates of total cases, hospitalizations, and deaths and to assert that the impact on children and younger adults has been far greater than that of a typical flu season.

After analyzing data for the weeks from Oct 18 through Nov 14, the Centers for Disease Control and Prevention (CDC) estimated that 47 million people, or about 15% of the population, have been infected and 9,820 have died in the pandemic. That compares with estimates of 22 million cases and 3,900 deaths issued Nov 12 and covering the period from April through Oct 17.

The new estimate of hospitalizations is 213,000, compared with 98,000 a month ago. – "By Nov 14, many times more children and younger adults, unfortunately, have been hospitalized or killed by H1N1 influenza than happens in a usual flu season," CDC Director Dr. Thomas Frieden said in a news briefing today.

The additional weeks covered in the latest report spanned the peak period for the fall wave of H1N1. In terms of the number of states reporting widespread activity, the last 2 weeks in October marked the crest, with 48 states in that situation. The number dropped to 43 states by the second week in November and has declined further since.

16 million cases in children

In an online report, the CDC estimated there have been 16 million cases in children up through age 17, leading to 71,000 hospitalizations and 1,090 deaths. For adults age 18 through 64, the agency estimated 27 million cases, 121,000 hospitalizations, and 7,450 deaths.

For elderly people, who are believed to have some protection form the virus because of past flu exposures, the new estimates are 4 million cases, 21,000 hospitalizations, and 1,280 deaths.

Less than 5% of the increases in total cases, hospitalizations, and deaths are explained by late reporting of events that occurred before Oct 17, the CDC report says. Frieden commented, "There is some correction for late reporting. But there has been a lot more disease in the month that's reported than in the months before."

All the numbers represent the midpoints of ranges of estimates the CDC produced with a new estimation method, which was unveiled Nov 12. The numbers of confirmed cases and related hospitalizations and deaths are far lower, because most people infected, including some who get severely sick, are not tested.

Comparing H1N1 with seasonal flu

When he was asked to compare the H1N1 pandemic with seasonal flu, Frieden said, "We know that it's much milder for older people. It's much less likely to result in death because older people

are much less likely to get infected. But it has been a much worse flu season for people under the age of 65, particularly younger adults and children."

According to CDC estimates that are often quoted, the nation has about 200,000 flu-related hospitalizations and 36,000 deaths in an average flu season, with about 90% of the deaths occurring in elderly people. Frieden noted today that the pandemic estimates are not derived in the same way as these seasonal flu estimates.

While the estimation methods are different, seasonal flu is believed to cause fewer than 1,000 deaths per year in people younger than 50, he added. He said the CDC doesn't have a specific estimate of H1N1 deaths among adults under age 50, but a "large share" of the adult deaths are in that group.

"So it is really many times more severe in terms of severe illness, and hospitalizations are several times higher for children and young adults than in a usual flu season," he said.

The CDC estimates that between 5% and 20% of the population get seasonal flu in an average year. If 15% of people have already been infected with H1N1, the nation, 8 months into the pandemic, is already approaching the upper end of the average attack rate for seasonal flu.

However, the estimated death toll so far, 9,820, remains well below the estimated seasonal flu toll of 36,000, though children and younger adults make up about 87% (8,540) of that total, the opposite of what is seen with seasonal flu. Meanwhile, the estimate of 213,000 H1N1 hospitalizations is slightly above the estimate of 200,000 hospital cases for a typical flu season.

In terms of case-fatality rate (CFR), the new CDC estimate of 9,820 deaths in 47 million cases translates into an overall rate of about 0.021%, or about 210 deaths per million people sickened by the virus. That's just slightly higher than the 0.018% CFR indicated by the previous CDC estimate of 3,900 deaths among 22 million cases.

But the CFRs differ considerably by age-group. The CFR for children, with an estimated 1,090 deaths in 16 million cases, comes to 0.007%, or about 70 deaths in a million cases. The CFR for adults between 18 and 64 comes out much higher, at 0.028%, or 280 deaths per million. And the rate for the elderly is higher yet, at 0.032%, or 320 deaths in a million cases—supporting the view that while seniors seem less likely to get sick, they are more likely to die if they do.

Time to get vaccinated

Frieden used the new estimates to stress the importance of getting vaccinated against the pandemic virus. If about 15% of the population has already been infected, he said, "That still leaves most people not having been infected and still remaining susceptible to H1N1 influenza."

He reported that another 12 million doses of vaccine became available in the past week, bringing the cumulative total to about 85 million doses. Many states now have met the vaccine demand from priority groups and have begun offering doses to everyone, he added.

The CDC in the past week began offering the vaccine to all employees, in line with state policy in Georgia, Frieden reported. He said he would get the nasal-spray vaccine himself in a few days.

Though cases have been declining recently, vaccination is prudent given the possibility of a third wave of cases this winter, he said. "Flu season lasts until May. And we don't know what the future will bring in terms of H1N1 influenza," he observed.

Deaths related to 2009 pandemic influenza A (H1N1) among American Indian/Alaska Natives - 12 states, 2009

Morb Mortal Wkly Rep (MMWR), 11 December 2009; 58 (48): 1341-1344
https://www.cdc.gov/mmwr/preview/mmwrhtml/mm5848a1.htm

Indigenous populations from Australia, Canada, and New Zealand have been found to have a three to eight times higher rate of hospitalization and death associated with infection with the 2009 pandemic influenza A (H1N1) virus (1).

In October, two U.S. states (Arizona and New Mexico) observed a disproportionate number of deaths related to H1N1 among American Indian/Alaska Natives (AI/ANs). These observations, plus incomplete reporting of race/ethnicity at the national level, led to formation of a multidisciplinary workgroup comprised of representatives from 12 state health departments, the Council of State and Territorial Epidemiologists, tribal epidemiology centers, the Indian Health Service, and CDC.

The workgroup assessed the burden of H1N1 influenza deaths in the AI/AN population by compiling surveillance data from the states and comparing death rates.

The results indicated that, during April 15 – November 13, AI/ANs in the 12 participating states had an H1N1 mortality rate four times higher than persons in all other racial/ethnic populations combined. Reasons for this disparity in death rates are unknown and need further investigation; however, they might include a high prevalence of chronic health conditions (e.g., diabetes and asthma) among AI/ANs that predisposes them to influenza complications, poverty (e.g., poor living conditions), and delayed access to care.

Efforts are needed to increase awareness among AI/ANs and their health-care providers of the potential severity of influenza and current recommendations regarding the timely use of antiviral medications. Efforts to promote the use of 2009 H1N1 influenza monovalent vaccine in AI/AN populations should be expanded.

In November 2009, all state health departments were invited to participate in the workgroup investigation by providing data on influenza-related deaths among their residents. Twelve states (Alabama, Alaska, Arizona, Michigan, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, and Wyoming) chose to participate, representing 50% of the AI/AN population in the United States. An H1N1 death was defined as a death in a resident of a participating state reported during April 15 – November 13 with any positive result from an influenza test, including rapid enzyme immunoassay, direct or indirect influenza fluorescent antibody, real-time reverse transcription – polymerase chain reaction assay (rRT-PCR), or viral culture.

Because >99% of influenza specimens tested during the study period had been found to be H1N1, *all cases with a positive influenza test were presumed to be H1N1* and not seasonal influenza.

Race/ethnicity and influenza risk status* of decedents were determined through review of death certificates, medical records, or death investigation reports. CDC-defined groups at higher risk for influenza complications were used to classify decedents as at high risk for influenza complications. Bridged-race vintage 2008 postcensal population estimates[†] were used by all states to determine population data for rate calculations.[§] Death rates by race/ethnicity were age adjusted to the 2000 U.S. standard population. Using rate ratios, AI/AN death rates were compared with death rates for all other racial/ethnic populations, including deaths in persons of unknown race.

A total of 426 H1N1 deaths were reported by the 12 states during April 15 – November 13 (Table 1). Forty-two deaths (9.9%) occurred among AI/ANs,[¶] although AI/ANs make up approximately 3% of the total population in the 12 states. The overall AI/AN H1N1-related death rate was 3.7 per 100,000 population, compared with 0.9 per 100,000 for all other racial/ethnic populations combined,** resulting in a mortality rate ratio of 4.0. Age group – specific H1N1-related death rates were 3.5 for persons aged 0 – 4 years, 1.1 for persons aged 5 – 24 years, 4.2 for persons aged 25 – 64 years, and 7.2 for persons aged ≥65 years. In all age groups, the AI/AN death rate was higher than the rate for all other racial/ethnic populations combined (Table 1).

Among the AI/AN deaths related to H1N1, 81.0% of decedents had high-risk health conditions, compared with 77.6% of persons in all other racial/ethnic populations combined (Table 2). In addition, greater percentages of AI/AN decedents had asthma (31.0%) and diabetes (45.2%) than decedents in all other racial/ethnic populations combined (14.1% asthma and 24.0% diabetes)

Editorial Note:

The AI/AN population is culturally diverse and spread among approximately 560 federally recognized tribal communities in 34 states and multiple urban areas (2). Health disparities between the AI/AN population and other racial/ethnic populations are well documented (3). Mortality rates and trends for respiratory diseases indicate that AI/ANs are at increased risk for death resulting from pneumonia and influenza (4,5). Although AI/AN death rates varied among the 12 participating states in this study, the aggregate AI/AN H1N1-related death rate from 12 states was four times higher than that of all other racial/ethnic groups combined.

The higher mortality rate among AI/ANs observed in this investigation is consistent with reports of increased influenza-related morbidity and mortality among indigenous populations in other parts of the world during the current H1N1 pandemic and also is consistent with observations from previous pandemics (1,2). After the influenza pandemic of 1918--19, U.S. government investigators reported that influenza-related mortality rates among AI/ANs were four times higher than the rates observed among persons in general urban populations (2).

The factors that produce a higher influenza mortality rate among AI/ANs are unknown but might include higher prevalence of underlying chronic illness such as diabetes. The age-specific prevalence of diabetes in AI/AN adults is two to three times higher than for all U.S. adults (6). In addition, AI/ANs are twice as likely to have unmet medical needs because of cost (7). AI/ANs also have the highest poverty rate (30%), which is twice the national rate and three times the rate for whites among households with children aged <18 years (8), suggesting that delayed access to medical care and living conditions associated with poverty might contribute to their higher influenza mortality rate.

The findings in this report are subject to at least five limitations. First, AI/AN decedents often are misclassified as persons of other races on death certificates, decreasing the number of A1/AN deaths by as much as 30% in some reports (*9*). Second, the time lags in reporting of deaths and the manner in which states collect death data and classify decedents as at high risk for influenza complications might vary and affect rate ratios in an unpredictable manner. Third, race and ethnicity were unknown for 19 deaths, although for a conservative comparison, these deaths were included with the combined group of all other racial/ethnic populations. Fourth, greater incidence of influenza disease among AI/ANs might have contributed to the higher mortality rate; however, the incidence of disease

among AI/ANs is unlikely to be so much greater than all other populations that it could account for a mortality rate that is four times higher. Data on race/ethnicity are not collected consistently for influenza patients. Finally, although >99% of all identified influenza strains in the United States during the investigation period were thought to be H1N1, confirmation by rRT-PCR or viral culture was not required for inclusion in this analysis.

Effective public health responses to influenza will depend on accurate and complete reporting of race/ethnicity in all state and federal mortality surveillance systems. Community education regarding the risk for influenza mortality among AI/ANs should be expanded. Increased efforts should be made to promote awareness among AI/ANs and their health-care providers about the signs and symptoms of influenza and recommendations for vaccination and the use of influenza antiviral medications early in the course of suspected influenza illness for those at increased risk for complications. Finally, factors that might contribute to increased influenza-related mortality in the AI/AN population, including the role of underlying chronic medical conditions and social determinants of health, should be topics for future investigation.

Acknowledgments

This report is based, in part, on contributions by CA Snider, MPH, Oklahoma City Area Tribal Epidemiology Center, and BL Cadwell, MSPH, Career Development Div, Office of Workforce and Career Development, CDC.

Health bosses accused of flu-mongering

Toronto Star, 11 December 2009
https://www.thestar.com/life/health-wellness/health-bosses-accused-of-flu-mongering/article_57fef1c6-773e-5345-8b03-0d6d997a2766.html

Public health officials are misleading Canadians by continuing to characterize the H1N1 virus as a threat in the hopes of unloading millions of doses of unused vaccine, charges Ontario's former chief medical officer of health.

They are trying to save face because of an expensive overreaction, Dr. Richard Schabas said Thursday as lineups for the vaccine continued to dwindle.

He made his comments the day after the Public Health Agency of Canada unveiled a new advertising campaign aimed at encouraging Canadians to get vaccinated.

"*Spending Christmas in bed or in an ICU unit is no fun* and the only way to actually avoid that is for a large number of Canadians to be immunized," agency head Dr. David Butler-Jones told a teleconference. He also said discussions are underway with the World Health Organization on what to do with the surplus vaccine.

Schabas, who is medical officer of health for Hastings and Prince Edward Counties, estimates that 35 million of the 50.4 million doses of vaccine that Canada has ordered, at a cost of more than $400 million, will not be used. – "*They bought 50 million doses of vaccine and it's an embarrassment to them that it's not being used*," he said, adding that it became available too late. "I think if you are going to make that push, you at least need to tell people that the outbreak is essentially over and you have to say to people any future risk of H1N1, at least this year, is extremely small. ... You shouldn't mislead people." Schabas said.

The number of Canadians visiting doctors with flu-like symptoms peaked in late October, he noted.

"The real story is the disconnect between what the senior public health officials, provincially and nationally, have been saying to people and what's actually been going on," Schabas argued. "*They have been misrepresenting the state of the outbreak and the level of risk*."

Schabas said health officials have been preparing for years for a deadly avian flu pandemic and have had trouble switching gears to respond the mild H1N1 pandemic. He added, people aren't buying into the fear as is evidenced by closing flu clinics. Toronto's eight remaining clinics were all to close Sunday but three of them shut their doors earlier this week because of little traffic.

While government officials now acknowledge the pandemic has turned out to be not as bad as initially feared, Schabas said they have been slow to adjust their responses. – "I think they got their knickers in a knot because they responded to their preconceptions. *There was a preconception that a pandemic was going to be a terrible event*," he said.

Ontario's 600-plus-page pandemic plan, like pandemic plans around the world, is modelled on a "moderately severe" pandemic with assumptions based on the 1957 flu pandemic. It anticipated 13,000 could die and up to 54,000 could require hospitalization.

The latest provincial *numbers show 104 H1N1-related deaths* and 1,656 hospitalizations so far.

Swine flu has hit about 1 in 6 Americans, CDC says

Los Angeles Times, 11 December 2009, 12 AM PT
https://www.latimes.com/archives/la-xpm-2009-dec-11-la-sci-swine-flu11-2009dec11-story.html

About 50 million Americans had contracted pandemic H1N1 influenza through Nov. 14, according to the newest estimates from the Centers for Disease Control and Prevention released Thursday – meaning that about 15% of the entire country has been infected, about 1 in every 6 people.

"That still leaves most people not having been infected and still susceptible," CDC Director Dr. Thomas R. Frieden said at a news conference. The agency also reported that more than 200,000 people had been hospitalized and nearly 10,000 had died.

Estimates released about *a month ago* showed 22 million Americans had been infected and that 3,900 had died. But that does not mean that 6,000 people died in the intervening month, Frieden said; delays in reporting account for some of the increase.

Frieden said the 200,000 hospitalizations since the beginning of the pandemic seven months ago is about the same as in a usual flu season.

The deaths are lower than the 35,000 associated with seasonal flu in a typical year, but the breakdown is sharply different.

The 10,000 deaths include 1,100 children and 7,500 adults 18 to 64. Those figures "are much higher than in a usual flu season," Frieden said.

In a normal flu season, there are about 1,000 deaths among Americans under 50. "But a large proportion of the 7,500 adults [who died] are under 50," he said. Hospitalizations among the younger group are also several times higher than normal.

The estimates are compiled from the number of laboratory-confirmed cases and from cases that may be listed on death certificates as pneumonia, organ failure or other infections, but that were precipitated by flu.

Since the beginning of the pandemic, researchers have been concerned by anecdotal reports that indigenous peoples suffer more from H1N1.

In a new study, CDC researchers found that the death rate for this group is four times higher than normal. The study, published Thursday in the agency’s Morbidity and Mortality Weekly Report, used data from 12 states that accounted for about half of the Native American population.

"That is most likely a reflection of environmental factors, underlying health conditions and access to healthcare," Frieden said.

In particular, diabetes is very prevalent among Native Americans. Such underlying conditions place people at higher risk of hospitalization and death from flu. Native Americans are among those with a high priority for the H1N1 flu vaccination, but the agency has no data on what proportion has received the shots, Frieden said.

H1N1 flu vaccine supplies continue to grow, he said. There are 85 million doses available, up by 12 million from last week. As supplies have increased, many communities have begun to expand eligibility for the vaccine to include the population at large.

Frieden recommended that people get the H1N1 flu vaccine because of uncertainties about whether a new wave of infections will hit in 2010. "What will happen in the future, only the future will tell," he said.

Estimates of the prevalence of pandemic (H1N1) 2009, United States, April–July 2009

Emerging Infectious Diseases. December 2009 15(12); DOI: 10.3201/eid1512.091413
https://web.archive.org/web/20091119151410/http://www.cdc.gov/eid/content/15/12/pdfs/09-1413.pdf
https://wwwnc.cdc.gov/eid/article/15/12/09-1413_article

Abstract

Through July 2009, a total of 43,677 laboratory-confirmed cases of influenza A pandemic (H1N1) 2009 were reported in the United States, which is likely a substantial underestimate of the true number. Correcting for under-ascertainment using a multiplier model, we estimate that 1.8 million–5.7 million cases occurred, including 9,000–21,000 hospitalizations.

Human cases of influenza A pandemic (H1N1) 2009 were first identified in the United States in April 2009 (1,2). By the end of July, > 40,000 laboratory-confirmed infections had been reported, representing only a fraction of total cases. Persons with influenza may not be included in reported counts for a variety of reasons, including the following: not all ill persons seek medical care and have a specimen collected, not all specimens are sent to a public health laboratory for confirmatory testing with reverse transcription–PCR (RT-PCR; rapid point-of-care testing cannot differentiate pandemic [H1N1] 2009 from other strains), and not all specimens will give positive results because of the timing of collection or the quality of the specimen. To better estimate the prevalence of pandemic (H1N1) 2009 during April–July 2009 in the United States, we created a simple multiplier model that adjusts for these sources of under-ascertainment.

...

Conclusions

We demonstrate that the reported cases of laboratory confirmed pandemic (H1N1) 2009 are likely a substantial underestimation of the total number of actual illnesses that occurred in the community during the spring of 2009. We estimate that through July 23, 2009, from 1.8 million to 5.7 million symptomatic cases of pandemic (H1N1) 2009 occurred in the United States, resulting in 9,000–21,000 hospitalizations. We did not estimate the number of deaths directly from our model, but among reports of laboratory-confirmed cases though July 23, the ratio of deaths to hospitalizations was 6%. When applying this fraction to the number of hospitalizations calculated from the model – that is, by assuming that deaths and hospitalizations are underreported to the same extent – we obtain a median estimate of 800 deaths (90% range 550–1,300) during this same period. Because this assumption has several limitations (5), more sophisticated models are also being developed to better understand the severity of the US epidemic in the spring of 2009, including intensive care unit admissions and deaths (6).

Our analysis involves several assumptions. Data for parameter estimates were collected in limited periods and areas and thus may not be fully representative of the entire United States. To account for some of this uncertainty, a range of values was included for each proportion. Additional data from surveys of health-seeking behavior, physician testing practices, and policies for confirmatory testing at public health laboratories could help refine the parameter estimates. In addition, parameters

were obtained from studies of persons with ILI, defined as fever with cough or sore throat. Persons with milder illness may be less likely to seek care or be tested, and thus may not be fully captured in these estimates. Likewise, in some heavily affected areas, the size of the outbreak quickly exceeded the capacity to ascertain and test case-patients. Thus, our results may reflect a conservative estimate of total cases.

As pandemic (H1N1) 2009 continues to spread through the United States and the world, laboratory -confirmed cases will continue to greatly underestimate the number of actual cases that occur. Surveillance for influenza does not traditionally rely on complete case ascertainment, which would be impractical, but on focused case ascertainment with well-characterized surveillance systems and special studies. Unfortunately, relying on laboratory-confirmed cases limits the ability to understand the full impact and severity of the epidemic, especially when severe cases are more likely to be recognized (5).

This model provides a relatively quick and simple approach to estimate the human health impact of the epidemic in advance of more rigorous analysis of surveillance and health care data that will be available over the next few years. Health systems and infrastructure may be unprepared in the short-term if plans are based on a number of confirmed cases that substantially underestimates the impact of the epidemic. We estimate that the total number of pandemic (H1N1) 2009 cases in the United States during April–July 2009 may have been up to 140× greater than the reported number of laboratory confirmed cases.

A spreadsheet version of the model has been developed and is available online (www.cdc.gov/h1n1flu/tools). Using this tool, health officials and policy makers could adjust the model parameters to represent their local experience, which may provide useful estimates of the prevalence of pandemic (H1N1) 2009 in their areas and help plan for a subsequent wave of the epidemic in the fall and winter months of 2009–2010.

Rokotusinfo ry

Correspondence with WHO on conflict of interest

Rokotos Info, December 2009
http://www.rokotusinfo.fi/yhd/kirjeenvaihtoa/who_0912_html

Update! See http://www.rokotusinfo.fi/en/memo_100119_html - 2010-01-19: Comments of Rokotusinfo in relation to Dr Eskola, THL, WHO's SAGE group and undeclared conflicts of interest.

For contact info, see Rokotusinfo ry at http://www.rokotusinfo.fi (in English) and World Health Organization at http://www.who.int

Correspondence with WHO, December 2009 is enclosed below. For some news coverage on the conflict of interest issue on WHO's pandemic declaration and vaccine expert groups, see Dagbladet Information (Denmark), Svenska Dagbladet (Sweden) and Kauppalehti (Finland). For WHO instructions on what experts are required to report, see quote below. For exact financial information from money transactions from GlaxoSmithKline to professor Eskola's employer THL (Finnish National Institute for Health and Welfare), see http://www.rokotusinfo.fi/tiedostot/thl-laskutus-091207_html.

***To assure the highest integrity**, and hence public confidence, in its activities, WHO policies require that all experts serving in an advisory role agree to disclose any circumstances which could give rise to a potential conflict of interest (i.e., any interest which may affect, or may reasonably be perceived to affect, the expert's objectivity and independence). Since you have been selected as a WHO expert in the activity described below, you are requested to disclose in this Declaration of Interest (DoI) form any financial, professional or other interest relevant to the subject of the work or meeting in which you will be involved and any interest that could be significantly affected by the outcome of the meeting or work. You are also asked to declare relevant interests of others who may, or may be perceived to, unduly influence your judgment (such as immediate family members, employers, close professional associates or any others with whom you have a substantial common personal, financial or professional interest.)*

---

To WHO:

Dear WHO staff,

I was very surprised to see at that professor Juhani Eskola, a SAGE member, has not disclosed the conflict of interest resulting from GlaxoSmithKlines funding of an estimated 6 million euros at year 2009. see at: http://www.who.int/immunization/sage/Final_LOP_DOI_16_Nov_09.pdf

The funding of 6 million euros (estimated by National Institute for Health and Welfare, Dr Terhi Kilpi, working under professor Eskola) is awarded to the National Institute for Health and Welfare, Eskola's employer. The conflict of interest resulting from the 6 million euros of funding and ordering of the GlaxoSmithKline Pandemrix vaccine by National Institute for Health and Welfare for 37 million euros has received quite a lot of publicity in Finland. Even the Minister of Health has decided that things have to be changed because of the conflicts of interest have become untolerable, see for example http://www.mtv3.fi/uutiset/sika/index.shtml/arkistot/kotimaa/2009/11/1003417

I trust you will take approriate action as you tell to the public in
http://www.who.int/csr/disease/swineflu/notes/briefing_20091203/en/index.html

< signature & contact info removed >

From WHO:

...

Thank you for your important message. The responsible officer for the SAGE Committee is Dr Phillip Duclos, who I have copied on this message, for further action. I have also copied Drs Okwobele and Kieny who have senior line management responsibilities for the Committee.

Please be assured that WHO takes the issue of conflicts of interest very seriously, and we will revert to you as soon as possible on the issue you have highlighted.

Regards ... < signature & contact info removed >

To WHO:

...

Judging from the Danish newspaper Information (original at http://www.information.dk/218247 apparently machine translated below to English so it might have errors), it seems WHO may have incorrect or misleading information on the nature of the GlaxoSmithKline pneumococcal trial which is contracted to professor Eskola's employer. The trial is one required for marketing authorization by the European medicines authority EMEA, i.e. is part of GlaxoSmithKline's product development.

It may be pertinent for WHO to also know professor Eskola's involvment in National Institute of Health and Welfare's research policies as the second-in-charge of the Institute. The National Institute of Health and Welfare has been repeatedly reprimanded by the Finnish oversight officials due to failures in upholding the Finnish law and informed consent in clinical trials; recently on a trial funded by GlaxoSmithKline. A few years back the institute was reprimanded for failures in proper procedures in a trial funded by an infant formula manufacturer and done on Finnish newborns (the FinDia trial, see for example:

http://en.wikinews.org/wiki/Finnish_parliamentary_ombudsman_faults_infant_formula_study).

The Institute's apparent response has been, instead of mending their procedures, to campaign for a law which would take away the parental consent requirement altogether, in direct contradiction of medical research ethical principles and the EU directive.

In the infant formula study, the institute did not tell infant's parents that the primary funding came from an infant formula company; thus the parents were not able to give informed consent. Professor Eskola was involved in correspondence regarding publication of an article partly based on the Findia trial's results. Professor Eskola's answer to the editor of the journal claimed there were no issues with the trial, in direct contradiction to the Parliamentary Ombudsman's findings described in the abovementioned news article. The Institute was reprimanded in 2006 also for not getting permission from both parents as required by Finnish law.

In the marketing authorization -related vaccine trial funded by GlaxoSmithKline, the trial staff did not seek permission from both parents, despite the Finnish law and the earlier reprimand. Thus they got a new reprimand in 2009, in which it was also found that the information given to participants was insufficient to result in an informed consent. We have contacted the European medicines agency EMEA and provided them with information on the trial.

You can find more information on the recent (2009) reprimand at
http://www.rokotusinfo.fi/en/draft_091211_html
Thank you for taking the issue seriously,
with kind regards ... < signature & contact info removed >

"Men i en mail skriver talsmand Gregory Härtl følgende:
»WHO har for nylig erfaret, at det finske Nationale Institut for Sundhed og Velfærd har en forskerkontrakt med GSK. Kontrakten drejer sig om et forskningsprojekt om pneumokokvaccine i det finske vaccinationsprogram. WHO vil træffe passende foranstaltninger i forhold til alt, hvad der måtte opfattes som interessekonflikter i denne sag.«"

"But in an e-mail, spokesman Gregory Hartl writes the following:

WHO has recently discovered that the Finnish National Institute of Health and Welfare has a research contract with GSK. The contract is a research project on pneumococcal vaccine within the Finnish vaccination programme. WHO will take appropriate action in relation to anything that might be perceived as conflicts of interest in this matter. "

Update: According to a Swedish business news site Ment.se, professor Eskola belongs to the secret WHO expert group with a key role in declaring a swine influenza pandemic. It is not clear from the news article what Ment.se is basing the claim on.

Update! See http://www.rokotusinfo.fi/en/memo_100119_html - 2010-01-19: Comments of Rokotusinfo in relation to Dr Eskola, THL, WHO's SAGE group and undeclared conflicts of interest.

Swine flu toll in isolated Gaza 'reaches 10'

AFP, 13 December 2009, 01:12 pm
https://web.archive.org/web/20091216145934/http://uk.news.yahoo.com/18/20091213/twl-swine-flu-toll-in-isolated-gaza-reac-3cd7efd.html

Two more people died of swine flu in the besieged Gaza Strip on Sunday, bringing to 10 the total number of Gazans who have been killed by the disease, according to the Hamas-run health ministry.

"Two more cases died today, a 25-year-old woman and a 35-year-old man, bringing the total number of deaths from A(H1N1) to 10," said Hassan Khalaf, a ministry spokesman.

He added that another 67 people have been stricken with the disease, including "a number of serious cases."

Gaza, which has been under strict Israli closure since the Islamist Hamas movement seized power in June 2007, was among the last places in the world to see cases of the virus, the first of which were reported a week ago.

The ministry has demanded 300,000 vaccines for the impoverished territory of 1.5 million people, including some 13,000 vaccines for government and public and private health workers.

Israel has already allowed in 10,000 doses of swine flu vaccine in a bid to prevent the latest outbreak from spreading to the Jewish state, which has lost 67 people to the virus.

Israel said last week it will allow in 30,000 to 40,000 more vaccines supplied by the World Health Organisation, but the transfer has not yet taken place, according to a military spokeswoman.

The Hamas-run government has meanwhile started examining foreigners entering the territory through the Erez crossing with Israel for signs of the disease, including by taking their temperature.

E se il virus fosse solo un raffreddore?
La Repubblica Reports on Pharma's Bumper Profits Thanks to Mild Swine Flu "Pandemic"

Le Repubblica, 14 December 2009
https://www.repubblica.it/2009/11/sezioni/cronaca/nuova-influenza-7/virus-raffreddore/virus-raffreddore.html

Poche Vittime - per fortuna - e molti affari. Il virus H1N1 si avvia a festeggiare il suo primo anno di vita con un bilancio pieno di sorprese: un tasso di mortalitï¿½ di gran lunga inferiore al previsto (lo 0,018%, meno dell'influenza stagionale), un deciso calo dei ricoveri negli Stati Uniti e in Europa (eccetto la Francia) proprio nei giorni in cui si temeva il picco della malattia e tante polemiche sulle vaccinazioni - in Italia si ï¿½ immunizzato solo il 14% degli operatori sanitari - e sul ruolo dei colossi farmaceutici e delle autoritï¿½ di controllo. Big Pharma, malgrado la mitezza della pandemia, ha giï¿½ incassato in sei mesi un jackpot da 20 miliardi di euro di entrate straordinarie. Mentre l'Organizzazione mondiale della sanitï¿½ (Oms) - accusata da qualcuno di eccesso d'allarmismo - ï¿½ stata costretta ad aprire un'inchiesta interna per verificare i possibili conflitti di interessi dei suoi consulenti scientifici. Accusati di essere pure a libro paga dell'industria. Per fare il punto della situazione, Repubblica ha sintetizzato in questo dossier il risultato di interviste, indagini e incontri con medici, case farmaceutiche, scienziati e politici raccolti negli ultimi giorni. Ecco il risultato.

Un virus (per ora) spuntato. Nessuno, naturalmente, discute la pericolositï¿½ dell'H1N1: la sua diffusione - complice un mondo sempre piï¿½ globale - ï¿½ stata rapidissima. Gli effetti perï¿½ sono stati meno gravi del previsto. Secondo l'Oms, il virus ï¿½ arrivato in 208 Paesi. Le vittime riconducibili a H1N1 perï¿½ sono "solo" - si fa per dire - 9.596 (800 nell'ultima settimana), una cifra di gran lunga inferiore alle 500mila causate ogni anno dall'influenza stagionale. "ï¿½ la pandemia piï¿½ lieve della storia", si spinge a dire Marc Lippsitch, epidemiologo di Harvard. In Italia siamo a quota 142, come dire un morto ogni 25mila casi di infezione (in totale da noi sono state colpite dall'influenza A 3.650.000 persone). Ma per la maggior parte il virus ï¿½ una concausa. Il Center for Disease Control americano ha calcolato il tasso di mortalitï¿½ nello 0,018%, contro il 2% della spagnola e lo 0,2% dell'influenza tradizionale. L'aviaria, per dire, ha avuto effetti letali sul 60% delle persone colpite. La task force di esperti della Casa Bianca pochi mesi fa prevedeva tra i 30 e i 90mila morti negli Usa (contro i 36mila della stagionale). Le stime reali parlano oggi di 10mila vittime statunitensi su 50 milioni di malati.

Non solo. Il peggio, almeno per la prima ondata pandemica, sembra alle spalle. Negli Stati Uniti e in Canada il numero dei ricoveri ï¿½ in calo da cinque settimane. In Italia, dopo tre settimane consecutive di flessioni, ha registrato un rialzo solo marginale negli ultimi sette giorni. A metï¿½ novembre ogni mille assistiti in ospedale si verificavano 11,2 casi di H1N1, ora siamo a quota 6,6. "Il picco ï¿½ passato - ammette Giovanni Rezza, direttore malattie infettive dell'Istituto superiore di sanitï¿½ - . Anche se, naturalmente, non bisogna abbassare la guardia". Il motivo? Il rischio di recrudescenze. "La spagnola - ricorda Maurizio De Martino, direttore di pediatria dell'ospedale Mayer di Firenze - ha avuto tre ondate in tre anni diversi". Oggi perï¿½ la pandemia ï¿½ sparita dalle prime pagine dei giornali e l'allarme sociale ï¿½ calato. "Le persone che ci chiamano per avere informazioni sono sempre meno - ammette Giacomo Milillo, segretario della Federazioni medici di medicina generale - . Certo, c'ï¿½ sempre il timore della mutazione, ma senza piï¿½ l'ansia delle scorse settimane".

Il milione di geni del virus, naturalmente, muta e continua a mutare. ï¿½ giï¿½ successo quando il micidiale H1N1, nato nel corpo di un volatile e migrato poi nei suini, ï¿½ riuscito ad aggredire nel 2009 in Messico - truccando il suo patrimonio genetico - le mucose respiratorie di Edgar Hernandez, il paziente-zero, un bambino di 5 anni (poi sopravvissuto) di La Gloria, Stato di Veracruz. "ï¿½ accaduto di nuovo poco dopo in Brasile", assicura Rino Rappuoli, numero uno della ricerca di Novartis. Ma tutte queste trasformazioni (come quella in Norvegia che porta all'attacco delle vie respiratorie profonde) si sono dimostrate - almeno per ora e incrociando le dita - meno pericolose e meno contagiose del previsto. "Siamo di fronte a variazioni minime che non cambiano le proprietï¿½ dell'H1N1" assicura Rappuoli. "Una mutazione fuori dallo spettro di copertura del vaccino ï¿½ sempre possibile - aggiunge Pietro Corvari, professore all'Universitï¿½ di Genova e tra i fondatori del centro anti-influenza - . Ma per ora siamo lontani da questa ipotesi e la presenza di adiuvanti rende la copertura piï¿½ estesa".

Un'influenza d'oro. Il virus killer, dunque, ï¿½ meno killer di quanto si pensasse. Corre veloce, ï¿½ riuscito persino a violare l'embargo strettissimo imposto alla striscia di Gaza (dieci morti). Ma, allo stato, pare - patologicamente parlando - piï¿½ debole del previsto. Dove invece non ha tradito le attese ï¿½ stato sul fronte finanziario: il business dell'H1N1 scoppia di salute. La Virus Spa, un sapiente mix di vaccini e di indotto figlio dell'ansia "preventiva", ha giï¿½ iniziato a macinare miliardi.

I primi beneficiari di questo inatteso (forse non troppo, dicono i maliziosi) Eldorado sono, come ovvio, i professionisti della pandemia: i produttori di vaccini. Fino a pochi anni fa parevano una specie sull'orlo dell'estinzione: le malattie virali piï¿½ gravi erano state sradicate dai Paesi ricchi. Le nazioni piï¿½ povere, dove queste patologie trovano ancora terreno fertile, non avevano i soldi necessari per acquistarle. Oggi ï¿½ cambiato tutto: l'aviaria e la minaccia di bioterrorismo hanno fatto ripartire alla grande gli investimenti. E l'influenza A ï¿½ stata la ciliegina sulla torta, una miniera d'oro che finora ha garantito ai big del settore un bonus da 12 miliardi. A settembre - con l'allarme H1N1 all'apice - la domanda di dosi era doppia rispetto alla capacitï¿½ produttiva mondiale. E i governi (Italia compresa) hanno firmato contratti in bianco, pagando in anticipo vaccini non ancora approvati pur di farne scorta adeguata. L'inglese Gsk ha piazzato in pochi giorni 440 milioni di dosi (al prezzo di 5 sterline l'una) di Pandemrix a 22 Paesi differenti con un incasso "straordinario" di quasi 3 miliardi di euro. Non solo: le vendite del suo Relenza, un anti-virale efficace in fase preventiva, sono decollate a 600 milioni di euro nei primi nove mesi 2009.

Il Tamiflu della Roche, un altro anti-virale giï¿½ sul mercato, ha decuplicato le vendite a 2 miliardi nel 2009 e secondo le stime del colosso svizzero ne macinerï¿½ altri 400 l'anno prossimo. La Novartis prevede di ricavare dal suo vaccino Focetria un miliardo in sei mesi. Piï¿½ o meno quanto incasserï¿½ grazie ai suoi nuovi prodotti la francese Sanofi. Centinaia di milioni entreranno pure nella casse dell'americana Baxter (titolare del vaccino Celvapan) e dell'inglese Astra Zeneca. Contratti una-tantum, d'accordo, ma in grado di generare a fine pandemia, secondo l'Oms, ricavi extra vicini ai 20 miliardi.

L'overdose di vaccini. Oggi, a contratti miliardari firmati, il mercato s'ï¿½ girato. La pandemia non morde. La gente - ridimensionata la percezione del rischio - non si vaccina. E milioni di dosi (scadenza media un anno) rimangono stoccate nei frigoriferi degli ospedali. L'Olanda ha giï¿½ deciso di mettere in saldo il 50% delle sue scorte, svendendo 17 milioni di dosi, con Macedonia e Malta pronte all'acquisto. Lo stesso sta pensando di fare la Gran Bretagna. E presto anche Francia (94 milioni di dosi ordinate) e Usa (85 milioni giï¿½ disponibili) - dove l'influenza A pare in decisa regressione - rischiano di dover affrontare lo stesso problema. A tre mesi dal lancio, insomma, siamo giï¿½ ai saldi di stagione. Di cui tra l'altro potrebbero beneficiare i Paesi piï¿½ poveri. Italia e Francia, per amor del vero prima della creazione del surplus, avevano giï¿½ destinato il 10% del loro stock proprio alle nazioni emergenti. E l'Oms si ï¿½ giï¿½ garantito la disponibilitï¿½ di 200 milioni di dosi per 95 Paesi a basso reddito. Quelli tra l'altro dove il virus, proprio per la mancanza di presidi, ï¿½ piï¿½ a rischio di mutazione anche perchï¿½ potrebbe incrociarsi con gli ultimi focolai di aviaria. Un'ipotesi che per gli scienziati mondiali ï¿½ a oggi un vero incubo.

I vaccini perï¿½ sono soltanto uno dei tanti rami del ricchissimo business della Virus Spa. Basta entrare in questi giorni in una farmacia per rendersi conto di come la sindrome H1N1 abbia contagiato pure i prodotti da banco. I gel disinfettanti per le mani (+50% di vendite ad ottobre in Italia secondo la Nielsen) tirano piï¿½ dell'aspirina. Gli americani, calcola l'istituto di ricerca Minter, spenderanno quest'anno 3,6 milioni di dollari in piï¿½ per difendersi dall'influenza A con una originale e personalissima forma di prevenzione fai-da-te. Gli oggetti del desiderio sono in particolare le mascherine per la protezione di naso e bocca (la 3M in tre mesi ne ha vendute per 100 milioni, facendo lavorare i suoi impianti 24 ore al giorno per 7 giorni alla settimana), gli sciroppi per prevenire tosse e raffreddore e i disinfettanti in tutte le loro declinazioni: le vendite di Clorox, l'amuchina a stelle e strisce, sono decollate facendo volare gli utili del gruppo.

Pandemia all'italiana. L'Italia, sul fronte del business della pandemia, finora ha solo pagato. La spesa "viva" a oggi - al di lï¿½ dei costi necessari per pagare Topo Gigio e di quelli strutturali per la task force del viceministro Ferruccio Fazio - ï¿½ rappresentata dal costo dei vaccini: 184,8 milioni. Sette euro (iva esclusa) a dose per ognuno dei 24 milioni di dosi di Focetria acquistate dalla Novartis con un contratto secretato dal Governo, malgrado le richieste di trasparenza della Corte dei conti.

L'accordo, siglato il 21 agosto, a farmaco non ancora approvato, ha alcune clausole molto particolari. Un codicillo a pagina 10, ad esempio, sgrava l'azienda svizzera di tutti i rischi pecuniari derivanti da eventuali effetti collaterali del prodotto. Caricandoli, in sostanza, sulle spalle dei cittadini italiani. "Il ministero - recita l'intesa - ï¿½ tenuto a indennizzare, manlevare e tenere indenne Novartis da qualsiasi perdita che Novartis sia tenuta a risarcire in conseguenza di danni a persone e/o cose causati dal prodotto". Salvo, deo gratias, "quelli di fabbricazione".

Sono tanti o poche 24 milioni di dosi? "L'Italia ha scorte piï¿½ che sufficienti - dice Rappuoli - . Il nostro vaccino scade in un anno ma forse potrï¿½ durare di piï¿½, vedremo. Di sicuro grazie agli adiuvanti ha uno spettro di copertura molto ampio e le ricerche che abbiamo fatto su un campione di 3mila bambini dai 3 mesi in su hanno dato risultati molto rassicuranti sulla tollerabilitï¿½". Francia e Gran Bretagna sono state piï¿½ prudenti di noi ordinando quantitativi che consentono di "coprire il 70-80% della popolazione con due dosi", come calcola Rezza, convinto perï¿½ che il Belpaese, grazie anche alla clemenza di questo primo picco di H1N1, "ha comprato il giusto, senza esagerare". "In fondo - conclude - quando un virus non ï¿½ ben conosciuto e ha un enorme potenziale infettivo bisogna prendere precauzioni adeguate".

Il nodo delle vaccinazioni. Comprati i vaccini, perï¿½, il problema ï¿½ vaccinare chi ne ha bisogno. E su questo fronte l'Italia fatica a carburare. All'8 dicembre, su 7 milioni e 432mila dosi distribuite, solo 689mila erano state inoculate. In Svezia ï¿½ stato giï¿½ immunizzato un terzo delle persone. In Gran Bretagna siamo giï¿½ ben oltre i 2,3 milioni. Il virus debole, per ora, annacqua le conseguenze dei nostri ritardi. Ma con un tasso di mortalitï¿½ piï¿½ alto, il Belpaese sarebbe nei guai. "Se finora le cose sono andate meglio del previsto, il merito non ï¿½ certo della vaccinazione che ha raggiunto un numero molto limitato di persone" sostiene Mauro Moroni, direttore malattie infettive dell'ospedale Sacco di Milano. La colpa del flop, dice De Martino, "ricade anche su chi non l'ha fatta a sï¿½, e parlo dei miei colleghi medici, e ai cittadini".

Gli ultimi dati del ministero (al 5 dicembre) certificano che solo 146mila operatori sanitari (il 14,1% del totale) hanno deciso di immunizzarsi e che la campagna di vaccinazione ha finora coperto il 10% delle donne gravide e il 14,3% delle persone a rischio. L'Istituto superiore di sanitï¿½ ha rivalutato le sequenze di 100 ceppi virali a caccia di eventuali mutazioni. Trovate solo in un paziente con polmonite, caso risolto dopo terapia intensiva e "non in fase di diffusione". Certo ï¿½ che se l'influenza A andasse scemando e la campagna di vaccinazioni continuasse ai ritmi da moviola con cui sta procedendo ora, anche l'Italia rischierebbe di trovarsi sul gobbo un bel po' di dosi di Focetria prossime alla scadenza. Ma, al momento, sarebbe il minore dei mali.

Le polemiche sull'Oms. La trincea della lotta all'influenza A ï¿½ un laboratorio nel sottosuolo del palazzo bianco dell'Organizzazione mondiale della Sanitï¿½ a Ginevra. L'unitï¿½ di crisi dove da dodici mesi lavora a ritmi forzati il Center for Strategic Health Operation, in codice Shoc. Un'equipe di scienziati un po' spiazzata dal decorso meno drammatico del previsto dell'inflazione. "C'ï¿½ stata una differenza tra quello che ci si aspettava e quello che si ï¿½ prodotto nella realtï¿½" ammette Nykia Alexander, consigliere speciale del direttore generale Chan. "La percezione di un virus molto meno letale del previsto - aggiunge - ha creato qualche problema". I responsabili dell'Oms smentiscono di aver peccato d'allarmismo. "Abbiamo sempre valutato in modo moderato gli effetti dell'attuale pandemia, dicendo che la maggioranza dei pazienti manifesta una sindrome influenzale benigna e guarisce completamente in una settimana, anche senza nessuna terapia".

Alcuni scienziati accusano l'Oms di aver modificato appositamente la definizione ufficiale di pandemia per poter dichiarare il livello massimo di allerta. A inizio 2009 la conditio sine qua non per lo stato d'emergenza (il livello 6) era quella di trovarsi di fronte a "un enorme numero di morti". Dizione sparita nei primi mesi dell'anno dal prontuario di Ginevra. "La confusione ï¿½ dovuta a una vecchia definizione sbagliata sul nostro sito che ï¿½ stata in effetti aggiornata", si giustifica Gregory Hartl, portavoce dell'organizzazione. Piï¿½ difficile replicare alle rivelazioni sui presunti conflitti di interesse di alcuni esperti scientifici degli advisory groups, i gruppi di consulenza dell'Oms sull'H1N1. Il medico olandese Albert Osterhaus, del comitato "Sage" incaricato delle linee guida per la prescrizione di vaccini contro il virus, avrebbe partecipazioni economiche in diverse societï¿½ farmaceutiche. Anche Frederick Hayden e Arnold Monto, altri due consulenti dell'Oms per la campagna di vaccinazione, sono stati accusati di collaborare stabilmente con Roche e Gsk. Su questo punto, la risposta dell'Oms ï¿½ stata una mezza ammissione. "Collaboriamo con l'industria farmaceutica per ragioni legittime. I laboratori farmaceutici - spiega Hartl - svolgono un ruolo essenziale per raggiungere gli obiettivi di salute pubblica". Per regole interne, i consulenti scientifici dell'Oms devono perï¿½ dichiarare ogni potenziale conflitto d'interesse. "Le accuse sono figlie della percezione di un virus meno letale del previsto - conclude il portavoce dell'organizzazione -. Ma sono preoccupazioni ingiustificate". Eppure da pochi giorni sul sito compare un comunicato di precisazione sugli advisory groups ed ï¿½ stata avviata un'inchiesta per verificare l'effettiva indipendenza dei comitati di consulenza a cui ï¿½ stata affidata la regia della prima pandemia globale.

"La realtï¿½ ï¿½ che da questa crisi abbiamo imparato due lezioni - conclude Rezza -. La prima ï¿½ che gli opposti estremismi, allarmismo e negazionismo, sono controproducenti. La seconda ï¿½ che dobbiamo imparare a produrre i vaccini piï¿½ rapidamente per prevenire situazioni piï¿½ gravi". Sperando, naturalmente, di non averne bisogno.

La Repubblica Reports on Pharma's Bumper Profits Thanks to Mild Swine Flu "Pandemic"

Le Repubblica, 14 December 2009

https://web.archive.org/web/20100102045622/http://theflucase.com/index.php?option=com_content&view=article&id=2315%3Ala-repubblica-reports-on-pharmas-bumper-profits-thanks-to-mild-swine-flu-qpandemicq&catid=1%3Alatest-news&Itemid=64&lang=en

According to the Italian newspaper "La Repubblica" WHO has started to conduct an internal investigation into the financial links between ist experts and the pharmaceutical industry as it comes under increasing criticism for declaring a pandemic level 6 and a mass swine flu vaccination campaign when the swine flu virus is mild.

"Only a few deaths and yet many companies will be celebrating the first year of H1N1 with a budget full of suprises because millions of extras were paid out to share holders after only six months in spite of the mildness of the pandemic. The role of the pharma giants, the supervisory boards and of scientists in this pandemic business seems in part very doubtful. That aside, a clever mix of vaccine material and induced fear has already begun to produce billions in a "preventative attack," writes Repubblica.

Just how thorough any internal inquiry by WHO will be remains to be seen.

Facts about Viruses that will shock you

Prevent Disease, 14 December 2009
https://web.archive.org/web/20100102175914/http://preventdisease.com/news/09/121409_two_facts_about_viruses_will_surprise_you.shtml

Most people consider viruses as living things the can reproduce on their own to spread and infect their hosts. The fact is, viruses are neither alive nor can they reproduce like other living organisms.

Anyone with a cold or the flu virus feels as if they are under attack by some organism. However, a virus does not belong to the kingdom of living things. Just because a virus seems alive doesn't mean it is alive. After all, it's not even a single-cell organism.

A virus is little more than a strand of DNA or RNA covered by a protein coating. Viruses are a thousand times smaller than bacteria and come in a wide range of shapes. Some look like weird, tall spiders whereas others look like prickly porcupine-like soccer balls.

One thing is for sure; viruses are very much a part of life on Earth and the human experience. Viruses infect animals, plants, and even bacteria. There are millions of different types of viruses found in almost every ecosystem on Earth and these minute structures are the most abundant type of biological entity. When considering that not only is viral presence on this planet all encompassing, but every sequenced organism to date has a major component of its genome that is viral in origin, it becomes apparent that viruses are integral players in the evolution of what we presently consider life.

Humans are in a constant battle with viruses. HIV (the virus that causes AIDS), the Ebola virus, and the West Nile virus continue to make headlines and take millions of lives. Recently, the H1N1 strain has made headlines as a pandemic virus as declared by the World Health Organization.

The probably multiple origins of viruses are lost in a sea of conjecture and speculation, which results mostly from their nature: no-one has ever detected a fossil virus as a particle; they are too small and probably too fragile to have withstood the kinds of processes that led to fossilisation, or even to preservation of short stretches of nucleic acid sequences in leaf tissues or insects in amber.

Are Viruses Alive?

Even though there is no precise definition of what separates the living from the non-living, there are a few common characteristics which many biologists consider requirements of life. Some nonliving things may have one or more of the characteristics but not all of them. For a virus then to be classified as alive it must:

* Reproduce
* Obtain and use energy
* Grow, develop, and die
* Respond to the environment

Viruses cannot use their genetic material by themselves

Viruses do have DNA or RNA, and DNA is the code for life. Having genetic material is an important step towards being classified as alive. DNA controls the evolution of the cell and the organism. Like living things, viruses evolve through time and thus can adapt to their environment.

But unlike cells, viruses cannot use their genetic material by themselves. Living matter reproduces and passes on genetic material as a blueprint for growth and subsequent reproduction. However, viruses need a living cell in order to function and reproduce; otherwise they are playing dead.

Viruses cannot divide or reproduce themselves without a host cell

Because viruses are not cells, they can't divide by binary fission like bacteria. Yet they do reproduce themselves in an extraordinary way. Their structure enables viruses to attack a plant or animal cell called a host cell. The protein shell protecting the virus' DNA is covered with spikelike protrusions. These spikes allow the virus to latch onto the cells they infect. Once hooked on, the virus injects its genetic material into the host cell.

The virus' DNA takes control of the cell once it's within the cytoplasm and begins to make the cell produce virus DNA and other parts of viruses. The host cell is forced to expend all of its energy and resources to help the virus replicate and make hundreds more viruses. The poor, weak cell usually bursts like an overinflated balloon from all the viruses and is destroyed in the process. Then, the replicated virus attaches itself to a new, unaffected host cell, and the viral infection continues.

Viruses do not produce or utilize their own energy

Living things do more than just reproduce. They also must obtain food to fuel the cell's metabolic activity. Some organisms, such as animals, eat other living things for energy. Other organisms, such as plants, harness the Sun's energy to make their own food. Because viruses aren't cells and have no activity within it, it has no need for food. However, the virus-controlled host cell needs material and energy to reproduce the viruses.

Viruses do not grow

All other living things also grow or get bigger. A virus does nothing inside its protein coat; therefore it does not grow.

Viruses cannot move themselves

Plants and animals react to the environment. All living things have ways of sensing the world around them and can respond to changes in their environment. Homeostasis is the property of an open system, especially living organisms, to regulate its internal environment so as to maintain a stable condition. Do viruses react? Viruses cannot move themselves, viruses can react to some changes in their environment but they have a very minimalistic internal environment.

Remember, the virus' DNA or RNA can evolve over time, thereby increasing its chances for survival and adapting to the environment. Like bacteria, they adapt through genetic mutations caused by rapid reproduction. That is why it is so hard to cure viral diseases. Viruses keep changing their DNA and protein coat to further their "life form" and keep ahead of the game.

Therefore, since a virus does not meet most of the requirements considered to be a living thing, a virus is not alive.

=> *Questions*: Phil Segrave. **How can viruses that are not alive be weakened?**

If 'dead viruses' can not really be attenuated before vaccination and they still possess the ability to replicate and mutate, is not the host's body being subjected to infection by an organism that is potentially reproductive and virulent, especially among people who have suppressed immune systems and other pre-existing conditions that restrict the development of 'anti-bodies', thus increasing the risk of epidemic rather than increasing 'herd immunity' within a given population?

If virus strains can be attenuated, how can the logistics of correctly weakening tons of material for millions of doses be possible? Phil Segrave.

THE FLU CASE

Scientists Make Breakthrough in Bird Flu Genetic Code

The Flu Case, 14 December 2009, 14:14
https://web.archive.org/web/20100102030924/http://theflucase.com/index.php?option=com_content&view=article&id=2285%3Ascientists-make-breakthrough-in-bird-flu-genetic-code&catid=1%3Alatest-news&Itemid=64&lang=en

ref. to

January 26, 2006
Washington – Scientists who have made a big leap in unraveling the genetic code of bird flu viruses along the way found a new clue that may help explain why the notorious H5N1 strain is so deadly.

St. Jude Children's Research Hospital in Memphis, Tenn., is home to a remarkable viral library, samples of about 11,000 influenza viruses that Dr. Robert Webster has gathered from around the world since 1976. They're not just flu viruses that have infected people over the years, but ones from pigs and other animals including about 7,000 bird flu viruses, gathered from poultry, ducks, gulls and other flocks.
https://web.archive.org/web/20100102030924/http://theflucase.com/index.php?option=com_content&view=article&id=2285%3Ascientists-make-breakthrough-in-bird-flu-genetic-code&catid=1%3Alatest-news&Itemid=64&lang=en

Thursday, St. Jude researchers reported in the journal Science that they have completed the first large genetic analysis of more than 300 of these bird flu viruses. They identified 2,196 bird flu genes and 160 complete genomes, doubling the amount of genetic information available for scientists to study how these viruses evolve and spread over time.

Simply having that new trove of gene information – posted in a public genetic database so that any scientist can mine it – in itself is a huge step, said Dr. Maria Giovanni of the National Institutes of Health, which has launched a major project to map influenza genomes and helped to fund the St. Jude's work. So far, most of the complete influenza genomes available are from human viruses.

Transcript of virtual press conference with

Dr Keiji Fukuda, Special Adviser to the Director-General on Pandemic Influenza

Geneva, WHO, 17 December 2009

https://web.archive.org/web/20100107164631/http://www.who.int/mediacentre/vpc_transcript_17_december_09_fukuda.pdf

Nyka Alexander: Good afternoon. We welcome you to WHO's weekly virtual press briefing from WHO today on December 17th, 2009. My name is Nyka Alexander and with us is Dr Keiji Fukuda, Special Adviser to the Director-General on Pandemic Influenza. He will begin by giving a situation update, and will then take your questions. Dr Fukuda, over to you now.

Dr Fukuda: Thank you Nyka. Welcome everybody, as the year draws to a close, we want to welcome you to this virtual press conference. As usual what I will do is try to highlight a couple of main points and then will throw it open to questions. Now one of the first points reflecting questions coming to WHO is that it really probably remains too early to call the pandemic over. I will go into a little bit more detail about this. But the second point that I also want to make, and an important one, is that given the current situation, WHO continues to provide all possible support to especially vulnerable countries in dealing with the current pandemic situation.

Now let me bring our attention back to the pandemic, and where we see things right now. Now we are now about 8 months into the pandemic and one of the common questions coming to us is, that *is the pandemic over*, is it time to call it, and really the answer is, that it *is still too early to make such a call*. And there are couple of main reasons for this.

In the first place, again I want to point out that the pandemic is a global event, it is really the worldwide spread of the virus and it is not a simply a regional event in which we see some activity going on in some parts of the world. Because of this WHO continues to monitor this situation, in all parts of the world, both in the northern hemisphere and the southern hemisphere. Based on this we see that activity or infections continue at quite high levels, in several different counties. For example, we see that activity continues to be at high levels in parts of Europe such as France and Switzerland, in the Czech Republic. We see that activity continues to be high in parts of central Asia such as Kazakhstan and Kyrgyzstan and we also see that activity continues to be high in some very large countries such as Russia. These were examples of countries around the world in which we continues to see high levels of activity.

Now the second reason is that it is clear in some parts of the world, such as North America and in some parts of Europe, we have seen that the pandemic activity for now, has clearly peaked and is on the way down. But one of the points about this is that the peaking has occurred extraordinarily early for influenza and we still have several months for winter to go and one of the big questions which is still before us is whether we expect to see yet another wave of activity occur or perhaps at late winter or in the early spring months and the answer right now is that we simply are not able to answer this questions right now. We are continuing to assess and monitor activities but right now we cannot predict whether we will see another upsurge and significant activity in the earlier parts of 2010.

Based on this assessment, based on the fact that we continue to see high levels of activity in many countries and we remain uncertain about what we might see in the earlier parts of 2010, WHO is very much continuing to provide support to countries which are particularly vulnerable in the face of pandemic infection. Now from the onset of the pandemic, this has really been the primary focus of WHO's efforts, which is to provide support to the countries, to be able to be ready to respond to the spread of this infection, and disease. As part of this effort, just one part of it, *one of the things that we have given particular attention to, is vaccines*.

Early on as the pandemic developed, WHO began identifying those countries that would have little or no access to vaccines. As you remember, both the Secretary General of the UN and the Director General of the WHO made appeals to both to the manufacturers, and also to the countries to help provide vaccines and

support to those countries, that have little access no access to pandemic influenza vaccines. In response to this request in the situation, 6 manufacturers and 12 countries so far have pledged approximately 180 million doses of vaccines to be distributed to approximately 95 countries.

There are other countries who are negotiating with WHO about donations, but right now we can say that there are 6 manufacturers and 12 countries which have made pledges. Now one of the important things about the vaccines which are being donated to WHO is that they are both adjuvanted and non adjuvanted vaccines, and there are negotiations about live attenuated vaccines. But before any of the vaccines are sent out to the countries, they will all be prequalified by WHO, that is we will go over and we will make sure, that they are manufactured according to standards, and that they pass regulatory procedures, so that they are safe and effective for the countries that they are given to.

Now one of the things that we are doing is moving as quickly as possible, with these many partners to make vaccines available to the countries. Now to receive the donated vaccines, we are asking the recipient countries to do three things: the first is simply to make a formal request to WHO so that we know that the country would like to have the vaccines; the second is to work with WHO to agree to some term and conditions, so we are both clear about how the vaccines will be provided, how they will be handled and so on; and the third step is for the recipient country to develop, the national plan, with WHO, to make sure that the vaccine once its provided, and is received in the country, is handled properly, so that it goes to the right people.

So three basic steps for the vaccines. Now because this is an unusual process this is very large and complicated operation and not one that anybody engages in a regular basis, WHO has provided as much help as possible to these recipient countries. So for example we have held 9 workshops in all regions of the world and these workshops are designed to help provide support on developing plans to answer questions and so on. So a lot of this work is going on in the past few months. So at this point we hope to begin deploying the vaccine in the next few weeks. And to get it to the first countries, a lot of this work in the distribution of the vaccines will be done with partners, one of the key partners is the United Nations Operations Group known as UNOPS. They are the group that we are working with to help actually get the vaccines physically to the different countries.

So again I want to point out that at this time, we believe that it is *too early to say that the pandemic is over*. We are monitoring the situation carefully but at this point it is premature and that again, because of this, WHO is continuing to work very hard in terms of providing as much support to countries as possible. So let me end there with the opening part of this virtual press conference and let's throw it open to questions. Thank you. ...

THE FLU CASE

WHO Plans to keep Extraordinary Powers assigned to it under a Pandemic for years

The Flu Case, 18 December 2009

https://web.archive.org/web/20100102021639/http://theflucase.com/index.php?option=com_content&view=article&id=2329%3Awho-plans-to-keep-extraordinary-powers-assigned-to-it-under-a-pandemic-for-years&catid=1%3Alatest-news&Itemid=64&lang=en

WHO officials said in a press conference yesterday that it was "too early to call the pandemic over" and suggested that the organisation *intends to retain the pandemic level 6 emergency designation for a "number" of years*.

Under a pandemic level 6 declaration, WHO is assigned a leading role under the pretext of protecting the globe against a dangerous disease.

WHO is allowed control not only of health services but also of the police and military of the 193 member states that signed the International Health Regulations 2005. *WHO can issue instructions to miltiary to force vaccinate and quarantine people*.

The powers of WHO are coming under increasing scrutiny as key members of WHO pushing for a pandemic level 6 declaration and mass vaccination are embroiled in controversies over financial links with pharmaceutical companies.

WHO maintains the swine flu virus will continue circulating for "a number" of years and vaccination campaigns are needed in spite of the evidence that the virus is mild and the vaccines are untested and dangerous.

Roselyne Bachelot assignée en référé le 4 janvier 2009 au TGI de Paris

Écrit par Flash-info-WLS, 17 Décembre 2009
https://web.archive.org/web/20091226035507/http://www.webtelelibre.levillage.org/index.php?option=com_content&task=view&id=2096&Itemid=40

Madame Roselyne Bachelot, Ministre de la Santé, a reçu vendredi dernier une assignation à comparaître en référé devant le Tribunal de Grande Instance de Paris le lundi 4 janvier prochain à 9 h, aux fins de mettre un terme dans les plus brefs délais à la campagne de vaccination contre la grippe H1N1.

Cette procédure judiciaire a été engagé, devant le « danger imminent » encouru par la population, par l'Association Cri-Vie (Coordination de Recherche et d'Informations Indépendantes en matière de Santé), présidée par le Dr Marc Vercoutère (Pau, Pyrénées-Atlantiques) et le parti politique d'extrême-centre Politique de Vie, présidé par Christian Cotten (St-Aubin, Essonne), psychosociologue, ont engagé.

Dans un climat de psychose entretenue par certains experts avec la dramatisation de «quelques morts spectaculaires» (selon le Pr Daniel Floret), les français subissent la promotion commerciale du Tamiflu – source de résistances et de détresse respiratoire aiguë – et celle des vaccins pandémiques hautement toxiques dont l'autorisation de mise sur le marché a été accordée trop rapidement malgré la notion de plusieurs hépatites auto-immunes sur les 400 enfants testés et de nombreuses maladies auto-immunes chez l'adulte en rapport avec le squalène (rapports de la FDA, février 2009 et de l'Agence européenne du médicament: EMEA). Malgré une sous-notification importante, le premier bilan de l'EMEA du 17 novembre fait d'ailleurs état de 55 décès après la vaccination de 5,7 millions de personnes, alors que les autorités s'attendaient à 5,75 décès pour 10 millions de vaccinés. Ce rapport bénéfice/risques déjà défavorable – à court terme – le sera beaucoup plus avec le déclenchement à moyen et à long terme de troubles neuropsychiques (Autisme, hyperactivité…) et «de dizaines de milliers de pathologies auto-immunes, imputées ou non au vaccin, comme les scléroses en plaques (SEP) avec le vaccin hépatite B» (Pr Marchou, CHU Toulouse). Entre 1994 et 2008, la fréquence des seules SEP était passée de 20 000 à 83 000 cas.

Alors qu'elle n'était intervenue que plusieurs années après la survenue des scandales passés, la justice française a l'opportunité de suspendre cette vaccination inefficace ainsi que l'utilisation des antiviraux avant qu'un collège d'experts indépendants n'évalue les réels effets du Tamiflu et de ces vaccins et ne propose des moyens simples et sains de prévention et d'accompagnement de la grippe.

Notre justice ne peut davantage ignorer que l'OMS, les officiels de Santé Publique et les compagnies pharmaceutiques ont construit une machine mondiale de propagande au sujet de pandémies imminentes. Mme Chan, directrice de l'OMS, a ainsi déclaré l'alerte pandémique de niveau 6 en suivant les conseils éclairés d'experts inféodés aux lobbies pharmaceutiques. C'est le cas des Prs Bruno Lina, président en France du GEIG, financé à 100% par les fabricants de vaccins contre la grippe et Osterhaus, conseiller en chef pour les questions de virus pour le gouvernement Britannique et Hollandais,expert-clé du SAGE (Strategic Advisory Group of Experts Président du European Scientific Working group on Influenza (ESWI) financé exclusivement par les géants pharmaceutiques, fabricants de vaccins.

Tandis que la Pologne a refusé de commander de tels vaccins, Igor Barinov, Président de la Duma a, de son côté, interpellé l'ambassadeur russe auprès de l'OMS à Genève pour qu'une enquête officielle soit lancée concernant les témoignages et preuves de corruption massive au sein de l'OMS. Il a demandé qu'une investigation fasse la lumière sur les liens financiers entre les experts de l'OMS en charge de la pandémie grippale et les firmes pharmaceutiques. Si la corruption est établie, la Russie envisage de se retirer de l'OMS. «Il est urgent qu'une commission internationale d'enquête puisse être mise sur pied, a-t-il déclaré. (Der Spiegel, 12/12/09)

Les auteurs de l'assignation et leurs avocats Maîtres Malika Ouarti (Barreau de Paris) et Jean-Pierre Joseph (Barreau de Grenoble) invitent journalistes et citoyens à assister en nombre à cette audience publique de référé qui se tiendra le lundi 4 janvier à 9 h du matin, au TGI de Paris, 4 bd du Palais (75001 PARIS), au cabinet du vice-président Emmanuel Binoche, avec les avocats des parties.

THE FLU CASE

French Health Minister receives court summons over mass Swine Flu Vaccinations

The Flu Case, 18 December 2009, 13:08
https://web.archive.org/web/20100102010134/http://theflucase.com/index.php?option=com_content&view=article&id=2337%3Afrench-health-minister-receives-court-summons-over-mass-swine-flu-vacinnations&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Roselyne Bachelot, the French Minister of Health was summoned on Friday last week to attend a hearing at the Superior Court in January as part of legal action to put an end the swine flu mass vaccination campaign launched by lawyers Malika Ouarti (Barreau de Paris) and Jean-Pierre Joseph (Barreau de Grenoble), according to local media reports.

The hearing will take place on Monday, January 4 at 9 am at the Tribunal de Grande Instance of Paris.

Bachelot, who worked for at least 12 years in the pharmaceutical industry, has played a key role in planning and executing the mass swine flu vaccination campaign in France.

Specifically, Bachelot was involved in the detailed planning to set up 1,100 special vaccination centers around the country, excluding GPs, for the vaccination of the entire population by the end of January 2010.

Also, she sanctioned a secret contract with pharmaceutical companies, giving them blanket immunity from any legal action in the event of their untested jabs causing death or damage.

Von Rainer Woratschka

Schweinerei mit der Grippe

Der Tagesspiegelza, 16 Dezember 2009, 00:00 Uhr
https://web.archive.org/web/20091217191003/www.tagesspiegel.de/politik/international/Schweinegrippe-Europarat;art123,2976433

Berlin – Vorgesehen sind eine Dringlichkeitsdebatte in der Parlamentarischen Versammlung und ein Untersuchungsausschuss.

Gesundheitsgefahr durch gefälschte Pandemien – unter diesem Motto beschäftigt sich der Europarat im Januar mit dem Einfluss der Pharmaindustrie auf die weltweiten Kampagnen gegen die Vogel- und Schweinegrippe. Vorgesehen sind eine Dringlichkeitsdebatte in der Parlamentarischen Versammlung und ein Untersuchungsausschuss.

Initiiert wurde beides von dem ehemaligen deutschen Bundestagsabgeordneten Wolfgang Wodarg (SPD), der in der Parlamentarischen Versammlung des Europarates noch als Chef des Unterausschusses für Gesundheit amtiert. Wodarg ist Arzt und Epidemiologe, er hält den Umgang mit der Schweinegrippe für "einen der größten Medizinskandale des Jahrhunderts". In seinem vom Ausschuss einstimmig beschlossenen Antrag kritisiert er die Beeinflussung von Wissenschaftlern und Behörden durch geschäftstüchtige Pharmaunternehmer. Dies habe dazu geführt, dass "unnötigerweise Millionen gesunder Menschen dem Risiko mangelhaft getesteter Impfstoffe ausgesetzt" worden seien – bei einer Infektionskrankheit, die "erheblich harmloser" sei als alle Grippewellen der Vorjahre und "nicht einmal ein Zehntel der hierbei üblichen Todesfälle" verursacht habe.

Schlimmer noch als die Tatsache, dass die Impfstoffhersteller mit ihrer Panikmache auf Kosten der Steuerzahler so prächtig verdient hätten, findet Wodarg, "dass man dafür auch Körperverletzung in Kauf genommen hat". Die in den Impfstoffen steckenden Wirkungsverstärker seien kaum erprobt worden, sagte der SPD-Politiker dem Tagesspiegel. Und auftretende Nebenwirkungen bis hin zu gefährlichen Nervenlähmungen würden nach wie vor nur lückenhaft registriert.

Beschäftigen müssten sich Europarat und Berichterstatter laut Wodarg insbesondere mit der Rolle der UN-Weltgesundheitsorganisation (WHO), die im Juni für die Schweinegrippe die höchste Pandemiestufe ausgerufen hat. Erstmals sei das Kriterium für die Höherstufung hierbei nicht mehr das tatsächliche Krankheitsrisiko gewesen, sondern die Zahl der Krankheitsfälle. Damit galt die Infektion als weltweite Seuche, die Staaten wurden zum Handeln gedrängt. Der hundertmillionenfache Kauf kaum getesteter Impfstoffe und Medikamente weltweit sei die Reaktion gewesen – trotz der Zurückhaltung einiger weniger skeptischer Staaten wie Polen, Luxemburg oder der Schweiz.

Weil die WHO nicht parlamentarisch kontrolliert werde, müssten dort nun die Regierungen Konsequenzen verlangen, fordert Wodarg. Es könne nicht sein, dass man die Pandemie-Definition einer Organisation überlasse, die offensichtlich dem Einfluss von Pharmaverkäufern unterliege. Viele der Entscheidungsträger dort kämen aus der Industrie und gingen wieder dahin zurück, sagte Wodarg. Zu untersuchen sei zudem die Rolle von und die Einflussnahme auf Paul-Ehrlich- und Robert-Koch-Institut, die in Deutschland entscheidenden Stellen.

In der Vergangenheit hat schon einmal eine Europaratsuntersuchung Staub aufgewirbelt. Im Jahr 2005 wurde der Schweizer Politiker Dick Marty beauftragt, den vermuteten geheimen Gefangenentransporten und Gefangenenlagern der CIA in Europa nachzuspüren. Seine Berichte belegten die Existenz von CIA-Geheimgefängnissen in Polen und Rumänien und das Mitwissen mehrerer europäischer Länder um die illegalen Aktivitäten.

SPD-Politiker Wolfgang Wodarg hält die Maßnahmen gegen H1N1 für "einen der größten Medizinskandale des Jahrhunderts" und macht die Schweinegrippe zum Thema im Europarat.

Gesundheitsgefahr durch gefälschte Pandemien – unter diesem Motto beschäftigt sich der Europarat im Januar mit dem Einfluss der Pharmaindustrie auf die weltweiten Kampagnen gegen die Vogel- und Schweinegrippe. Vorgesehen sind eine Dringlichkeitsdebatte in der Parlamentarischen Versammlung und ein Untersuchungsausschuss.

Initiiert wurde beides von dem ehemaligen deutschen Bundestagsabgeordneten Wolfgang Wodarg (SPD), der in der Parlamentarischen Versammlung des Europarates noch als Chef des Unterausschusses für Gesundheit amtiert. https://web.archive.org/web/20090918071642/http://www.wodarg.de/ Wodarg ist Arzt und Epidemiologe, er hält den Umgang mit der Schweinegrippe für "einen der größten Medizinskandale des Jahrhunderts".

In seinem vom Ausschuss einstimmig beschlossenen Antrag kritisiert er die Beeinflussung von Wissenschaftlern und Behörden durch geschäftstüchtige Pharmaunternehmer. Dies habe dazu geführt, dass "unnötigerweise Millionen gesunder Menschen dem Risiko mangelhaft getesteter Impfstoffe ausgesetzt" worden seien – bei einer Infektionskrankheit, die "erheblich harmloser" sei als alle Grippewellen der Vorjahre und "nicht einmal ein Zehntel der hierbei üblichen Todesfälle" verursacht habe.

Council of Europe will investigate and debate on "Faked Pandemic"
Wodarg fordert Untersuchung des Schweinegrippe-Skandals durch den Europarat

Dr. Wodarg / Parlamentary Assembly, 18 December 2009

https://web.archive.org/web/20100110091137/http://www.wodarg.de/presse/2948122.html

Council of Europe will investigate and debate on "Faked Pandemic"/Wodarg fordert Untersuchung des Schweinegrippe-Skandals durch den Europarat

12.12.2009: Hier ein Antrag in englischer Sprache, den ich am 11.Dezember 2009 in Paris beim zuständigen Sozial und Gesundheitsausschuss als Vorsitzender des Unterausschusses für Gesundheit in den Geschäftsgang der Parlamentarischen Versammlung des Europarats eingebracht habe. Der Europarat soll sich in einer Dringlichkeitsdebatte mit der von der WHO und weiterer Institute zugunsten einiger Pharma-Konzerne inszenierten "Schweinegrippe-Pan(ik)demie" beschäftigen und einen Untersuchungsausschuss hierzu etablieren.

Motion for a Resolution and a Recommendation
Faked Pandemics - a threat for health

In order to promote their patented drugs and vaccines against flu, pharmaceutical companies influenced scientists and official agencies, responsible for public health standards to alarm governments worldwide and make them squander tight health resources for inefficient vaccine strategies and needlessly expose millions of healthy people to the risk of an unknown amount of side-effects of insufficiently tested vaccines.

The "birds-flu"-campaign (2005/06) combined with the "swine-flu"-campaign seem to have caused a great deal of damage not only to some vaccinated patients and to public health-budgets, but to the credibility and accountability of important international health-agencies.

The Council of Europe and its member-states should ask for immediate investigations and consequences on their national levels as well as on the international level.

The definition of an alarming pandemic must not be under the influence of drug-sellers.

Explanatory remarks

When in April 2009 some hundred normal influenza cases in Mexico City were rashly announced to be the beginning of a threatening new pandemic, there was little scientific evidence for this judgement. Nevertheless a large and immediate word-wide agenda setting process started and was eagerly spread by alarmist media and formally legitimized by pandemic-defining WHO, the agency, which is our global epidemiological watchdog and task-force.

Besides this, vaccination programs against influenza are already established in most of the exposed countries as an annual routine. They are regularly taking into account all expected varieties of flu-viruses to bundle their antigen fragments in a well-adjusted polyvalent vaccine.

But around the Mexican outbreak, WHO in cooperation with some big pharmaceutical companies and their scientists re-defined pandemics and lowered the alarm-threshold. Those new standards forced politicians in most states to react immediately and sign marketing commitments for additional and new vaccines against "swine-flu" and spend billions of dollars to catch up with the alarming scenario that Big Pharma, media and WHO were spreading.

From the beginning in April 2009 it was clear, that a newly combined flu-virus was on its way - as many flu-virus-variations have been almost every year before. From the first cases in Mexico it was also evident, that this new subtype was doing less harm to infected humans than others in former years. Nevertheless the "swine-flu-campaign" was increasingly threatening people, filling television programs, newspapers, health-agendas, ambulances and hospitals.

Never before the search for traces of a virus was carried out so broadly and intensively. Besides, many cases of death, that happened to coincide with seropositive H1N1 lab-findings, were simply attributed to "swine-flu" and used to foster fear.

Additionally it has been proven, that at least one third of the population older than 60 had already positive test results because of flu contacts in the second half of the last century. In contrast to this "agenda setting process" it has to be stated, that the annual worldwide spreading ("pandemic") of 2009- influenza was a relief for global health, compared with the suffering, influenza waves used to originate most of the years before.

The Australian flu-season, which has already passed by with the Australian winter, has even given evidence, that the infection with "swine-flu" brings some protection against other, more dangerous virus-types. Nevertheless we have to observe, that a faked "swine-flu"- pandemic is still used for marketing risky vaccines.

The victims among millions of needlessly vaccinated people must be protected by their states and independent scientific clarification should provide evidence and transparency for national and -if necessary- European courts.

Tabled by
Dr. Wolfgang Wodarg (Soc. Germany)
(already signed and supported by a sufficient number of menbers of the Parliamentary Assembly of the Council of Europe)

THE FLU CASE

European Parliament to Investigate WHO in January 2010

The Flu Case, 20 December 2009, 11:10

https://web.archive.org/web/20100102042527/http://theflucase.com/index.php?option=com_content&view=article&id=2350%3Aeuropean-parliament-to-investigate-who-in-january-2010&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Council of Europe member states are to launch an inquiry in January 2010 on the influence of the pharmaceutical companies on the global swine flu campaign, focussing especially on extent of the pharma‘s industry’s influence on WHO, according to reports in the German media.

https://web.archive.org/web/20091218020311/www.zeit.de/politik/2009-12/schweinegrippe-europa
https://web.archive.org/web/20091217191003/www.tagesspiegel.de/politik/international/Schweinegrippe-Europarat;art123,2976433

Wolfgang Wodarg , former SPD member of parliament, and chairman of the European parliament’s health committee, initiated the inquiry. The motion was passed unanimously by his colleagues in the European parliament‘s health committee.

Wodarg has criticised the measures taken against the swine flu as "one of the biggest medical scandals of the century."

He said the influence of the the pharamaceutical industry on scientists and government officials has resulted in "millions of healthy people being exposed unnecessarily to the risks of an inadequately tested vaccine."

That even though, the swine flu virus is "much less harmful" than last year’s seasonal flu causing "not even a tenth of the usual deaths associated with flu."

Wodarg has also criticised the way pharemceutical companies have made gigantic profits at the expense of tax payers.

He accused vaccine manufacturers of being willing even to inflict bodily harm" in their pursuit of profits, noting that the adjuvants in the swine flu jab have hardly been tested.

In addtion, the vaccine‘s side effects including dangerous paralysis have not been adequately recorded.

Wodarg has said that the role of the WHO and its the pandemic emergency declaration in June needs to be the especial focus of a European parliamtary inquiry. For the first time the criteria for a pandemic was made not the actual risk of a diseases but the number of cases of the disease.

By classifying the swine flu as pandemic, nations were compelled to implement pandemic plans and also the purchase swine flu vaccines.

Because WHO is not subject to any parliamentary control, Wodarg argued it is necessary for governments to insist on accountability.

What is a pandemic should not be allowed to be defined by an organisation that is clearly under the influence of the pharmaceutical companies that profit from the sales of vaccines accompanying such a pandemic. Many of the decision-makers in WHO have worked for the pharma industry and go back to work in the pharma industry.

The inquiry is also to look at the role of the Paul-Ehrlich and the Robert-KochInstitute in Germany.

N BIOU

L'OMS est-elle soumise aux industries pharmaceutiques?

NBiou, 22 December 2009
https://web.archive.org/web/20100101223802/http://www.nbiou.com/science-et-sante/loms-est-elle-soumise-aux-industries-pharmaceutiques/

Les Etats membres du Conseil de l'Europe ont décidé de lancer une enquête en janvier 2010. En effet, les questions qui se posent sont: *«Quelle influence auraient pu avoir les compagnies pharmaceutiques sur la campagne de la grippe porcine?»*, ou encore *«Dans quelle mesure l'industrie pharmaceutique influence l'OMS?»*

Le Dr Wolfgang Wodarg, ancien parlementaire SPD et président du comité européen de la Santé a lancé une enquête adoptée à l'unanimité par le comité du Parlement Européen à la Santé. Il aurait vivement critiqué les mesures prises pour lutter contre la grippe porcine, les qualifiant comme étant *«un des plus grands scandales médicaux du siècle»* et rappelant les conséquences de l'influence de l'industrie pharmaceutique sur les politiques et les scientifiques: *«des millions de gens en bonne santé ont été exposés inutilement aux risques d'un vaccin insuffisamment testé»*.

Le président du comité européen de la Santé a ainsi pointé du doigt les risques pris avec la vaccination de masse, l'insuffisance de tests effectués, les effets secondaires incorrectement rapportés.

Wolfgang Wodarg n'en est pas resté là et n'a pas oublié de mentionner les profits colossaux que les firmes pharmaceutiques ont réalisé auprès du contribuable. Ainsi il a aussi précisé que le rôle joué par l'OMS, de même que sa déclaration d'urgence pandémique en juin devrait faire l'objet d'un minutieux examen. Les conséquences de cette déclaration de «pandémie» sont énormes et contraignent les pays a une certaine politique de santé.

L'OMS n'est sujette à aucun contrôle parlementaire. Elle définie ce qu'est une pandémie. Choisie lorsqu'il y a pandémie. Beaucoup de décideurs de l'OMS ont travaillé pour l'industrie pharmaceutique ou continuent de travailler pour cette industrie. Tout ceci sans aucun contrôle, sans aucun contre-pouvoir. En découle l'ensemble des mesures, investissements et profits, auxquels nous avons assisté.

Alors même que les firmes pharmaceutiques se sont défaussées légalement et au préalable de toute responsabilité, le Dr Wodarg a justement souligné l'importance de celle-ci.

Cette enquête devrait permettre d'éclairer toutes ces zones brumeuses nauséabondes.

H1N1-Pandemien er en af århundredets største medicinalskandaler'
This "Pandemic" is one of the greatest medical scandals of the century"

Information, 28. december 2009
https://www.information.dk/udland/2009/12/h1n1-pandemien-aarhundredets-stoerste-medicinalskandaler

Medicinalindustrien skal ikke længere diktere, hvor meget vaccine der skal sælges under en pandemi, siger formand for Europarådets sundhedskomité, Wolfgang Wodarg. Komiteen kulegraver i januar medicinalindustriens indflydelse på WHO.

(Photo): *Egyptiske børn bærer maske for at undgå at blive smittet med H1N1-influenza. Da WHO i juni udråbte H1N1 til en pandemi, udløste det panik verden over, og selv om det har vist sig blot at være en mild influenza, har landene købt styrtende ind med H1N1-vaccine, og det har forgyldt medicinalindustrien.*

»Vi har haft en mild influenza - og en falsk pandemi, «siger Wolfgang Wodarg, der er formand for Europarådets sundhedskomite. Den tyske parlamentariker er også epidemiolog og tidligere sundhedsdirektør i Flensborg, og derfor har han fulgt H1N1-pandemien nøje fra den 11. juni og indtil i dag. Han kalder pandemien for »en af århundredets største medicinalskandaler«, og derfor har han taget sagen op i Europarådet:

»Til januar afholder vi en nøddebat om medicinalindustriens indflydelse på WHO, hvor 47 parlamenter rundt om i Europa bliver informeret. Herefter begynder vi en kontrolundersøgelse og høringer af de ansvarlige for pandemiberedskabet,« siger Wolfgang Wodarg.

»Målet er, at ingen medicinalvirksomheder under nogen omstændigheder må få indflydelse på pandemiberedskaberne,« siger han og tilføjer, at der også skal kigges på patentreglerne:

»Vacciner er også et etisk emne. Et præparat, der er så vigtigt for vores samfund, bør medicinalindustrien ikke kunne få patent på at udvikle.«

Definition på en pandemi

Allerede i 2004, under fugleinfluenzaen, opsøgte Wolfgang Wodarg (der dengang var tysk parlamentariker for SPD) WHO for at bede om beviser for nødvendigheden af et pandemisk beredskab:

»Fugleinfluenzaen var farligere end H1N1, men langt mindre smitsom, og derfor var argumenterne for en kommende pandemi mildest talt tynde. Men fugleinfluenzaen var med til at skabe en panikstemning og har påvirket mange lande til at lave et beredskab. Tyskland, Danmark og mange andre lande købte desuden store lagre af Tamiflu, selv om det ikke var testet ordentligt,« siger han og kritiserer også de vaccine-kontrakter, som mange lande indgik i tiden efter fugleinfluenzaen:

»Staterne indgår nogle kontrakter med vaccineproducenterne, hvori de på forhånd afgiver bestillinger og påtager sig stort set hele ansvaret. På den måde er vaccineproducenterne sikret enorme indtægter uden at løbe nogen økonomisk risiko. Så venter de bare på, at WHO siger 'pandemi' og dermed aktiverer kontrakterne.«

Derfor finder Wolfgang Wodarg det også mystisk, at WHO ændrede sin pandemidefinition på hjemmesiden i slutningen af maj i år:

»Fra juni 2009 er det ikke længere nødvendigt, at 'et enormt antal mennesker er smittede eller døde' - der skal blot være tale om en virus, der spreder sig på tværs af landegrænser, og som mennesker ikke er immune overfor,« siger han.

Patenterne vinder

Hvert år opstår en ny influenza - og hvert år blander man derfor den eksisterende vaccine med den nye virus for på den måde at kunne vaccinere befolkningen imod den nye sæsoninfluenza. Wolfgang Wodarg mener, at man kunne have benyttet samme metode til at vaccinere befolkningen meget billigere imod svineinfluenza:

»Hvis man blot havde tilført H1N1-virus til de influenzavacciner, som vi allerede har, så havde der ikke været behov for et pandemiberedskab - men nogle af tilsætningsstofferne i vaccinen er patenterede, og derfor er der ingen fra industrien, der er interesserede i at blande den gamle vaccine med den nye,« siger han og tilføjer:

»Producenterne anbefalede desuden, at man vaccinerer to gange, hvilket heller ikke er normalt. Det siger sig selv, at de tjener flere penge på den måde. Derfor var der flere ting, der gjorde mig mistænksom.«

Ingen kontrol med WHO

Wolfgang Wodarg valgte at konsultere resten af Europarådet, fordi der reelt ikke findes kontrol med WHO. Kun regeringerne kan få indflydelse via WHO's årlige samling. I dag er der flertal i Europarådets sundhedsudvalg for en uvildig undersøgelse af medicinalindustriens indflydelse på WHO.

- I Rusland har en russisk parlamentariker foreslået et boykot af WHO, indtil der kommer styr på gennemsigtigheden. Hvad mener du om det?

»Enhver, der har epidemiologisk viden, bør have sat spørgsmålstegn ved WHO's håndtering af sagen fra begyndelsen.«

- Hvem skal sikre, at vi har teknisk viden om vacciner, hvis industrien ikke må deltage?

»Det skal uafhængige institutter, som kontrolleres af medlemslandenes parlamenter, og som har fuld åbenhed, så offentligheden kan kigge med. De skal sætte standarden for, hvor mange penge der bliver brugt på vacciner. Alene i Tyskland har vi brugt 700 mio. euro på pandemiberedskabet, og i Europa er det omkring to mia. euro. Det er enorme summer. Men derudover er vacciner også et etisk emne. Der bør ikke være patenter på en vaccine, der er så vigtig. Alle, der rent teknisk kan, skal producere vacciner så hurtigt som muligt, når der opstår en nødsituation. På den måde kan vi redde flere liv, når der reelt kommer en pandemi.«

- Er det realistisk at fjerne industrien helt fra WHO-regi?

»Nej, og derfor skal vi insistere på gennemsigtighed. Derudover skal de ikke sidde med i de udvalg, der reelt beslutter, hvornår vi har en pandemi, og hvem der skal vaccineres. De skal bare svare på, hvor hurtigt de kan levere vacciner. Og kun når de bliver spurgt,« siger Wolfgang Wodarg.

- WHO giver 180 millioner doser til tredjeverdenslande, som de har fået fra medlems-landenes overskudslagre. Hvad mener du om det?

»Jeg mener, at det er komplet meningsløst, og hvis vi ikke opretholder kontrollen med de utestede tilsætningsstoffer, så kan det gøre mere skade end gavn.«

This "Pandemic" is one of the greatest medical scandals of the century"
H1N1-Pandemien er en af århundredets største medicinalskandaler'
(translation was taken from the website of Jane Burgermeister – The Flu Case)

Information, 28 December 2009
https://web.archive.org/web/20100102020202/http://theflucase.com/index.php?option=com_content&view=article&id=2425%3Abig-pharmas-influence-on-who-must-end-says-european-parliament-investigator-reports-information&catid=41%3Ahighlighted-news&Itemid=105&lang=en
https://www.information.dk/udland/2009/12/h1n1-pandemien-aarhundredets-stoerste-medicinalskandaler

The pandemic is one of the greatest medical scandals of the century. The pharmaceutical industry is no longer to dictate how much vaccine is going to be sold during a pandemic, says head of the Health Committee in the European Council, Wolfgang Wodarg. In January the Committee will take an in depth look into the influence of the pharmaceutical industry on WHO.

By Louise Voller, Kristian Villesen

"We have had a mild flu – and a false pandemic," says Wolfgang Wodarg, the chair of the Health Committee in The European Council. The German parliamentarian is also an epidemiologist and former health director in Flensburg. For that reason he has followed the H1N1-pandemic closely since June 11 and up to the present. He calls the pandemic "one of the greatest medical scandals of the century", and for that reason he has decided to take the case to the European Council:

"In January, we will arrange an emergency debate about the influence of the pharmaceutical industry on the WHO, and 47 parliaments all over Europe are going to be informed. Following this, we will initiate an investigation and hearings involving those responsible for the pandemic emergency," says Wolfgang Wodarg.

"The aim is that none of the pharmaceutical companies under any circumstances must be allowed to make their influence felt on pandemic emergencies," he says and adds that rules for patenting also will be checked:

"Vaccines are also an ethical issue. The pharmaceutical industry should not be allowed to get a patent to develop a preparation which is so important for our society."

Definition of a Pandemic

As early as 2004, during the avian flu, Wolfgang Wodarg (at that time a German parliamentarian for the SPD) went to see WHO to ask for proof that a pandemic emergency was required:

"The avian flu was more dangerous than the H1N1, but far less contagious, and accordingly the arguments for a coming pandemic were thin to put it mildly. But the avian flu helped create an atmosphere of panic, and it influenced many countries to create a pandemic emergency plan. Furthermore Germany, Denmark and many other countries have bought large stocks of Tamiflu, even though it has not been sufficiently tested," he says, and criticises also the vaccine contracts that many countries entered into in the period after the avian flu:

"The governments have sealed contracts with vaccine producers where they secure orders in advance and take upon themselves almost all the responsibility. In this way the producers of vaccines

are sure of enormous gains without having any financial risks. So they just wait, until WHO says "pandemic" and activate the contracts."

For that reason, Wolfgang Wodarg also finds it suspicious that WHO changed it's definition of a pandemic on it's homepage at the end of May this year:

"From June 2009 it is no longer necessary, that "an enormous amount of people have contracted the illness or died" – there simply have to be a virus, spreading beyond borders, and one that people have no immunity towards," he says.

The patent holders are the winners

Every year a new flu comes into existence – and every year you accordingly mix existing vaccine with the new virus in order to inoculate the population against the new seasonal flu.

Wolfgang Wodarg holds the opinion, that you could have used the same method to vaccinate the population against swine flu in a much cheaper fashion.

"If you simply had added H1N1 virus to the flu vaccines we already have in stocks, then there would have been no need for at pandemic emergency – but some of the additives in the vaccines are patented, and therefore nobody from the industry is interested in mixing the old vaccine with the new one," he says and adds:

"Furthermore the producers recommended, that you inoculate twice, which is not normal. It is self evident that they earn more money in that way. Therefore several things made me suspicious."

No control over WHO

Wolfgang Wodarg chose to consult all the other members of the European Council because at the end of the day there is no control with the WHO. Only governments can exercise influence through the annual assembly in WHO. Today, a majority of the Health Committee in the European Council agree on an independent investigation of the influence of the pharmaceutical industry on WHO.

• In Russia a Russian parliamentarian has suggested a boycot of the WHO until transparency is established. What do you think about that idea?

"Everybody who knows about epidemiology should have questioned the way WHO handled this case from the beginning."

• How will we ensure we have technical knowledge about vaccines, if the industry is not allowed to participate?

"Independent institutes which are controlled by the parliaments of the member countries, and which maintain complete transparency so that the public can follow what is going on. They will have to set the standard for how much money is going to be used on vaccines. In Germany alone, we have spend 700 millions euros on pandemic emergency and in Europe it is around two billions euros. It is emormous amount of money. But furthermore vaccines are an ethical topic. A vaccine which is that important should not be patented. Everyone, who technically is capable of doing so should produce vaccines as quickly as possible when an emergency arises. In that way we can save more lives when a true pandemic arrives."

• Is it realistic to remove the industry totally from the WHO?

"No, and therefore we have to insist on transparency. Furthermore they don't have to participate in the committees, which in reality decide when we have a pandemic, and who is going to be inoculated. They just have to answer how quickly they can deliver vaccines. And only when asked," says Wolfgang Wodarg.

WHO gives 180 million doses to third world countries, which they have got from the member countries surplus stocks. What do you thing about that?

"I find it completely senseless, and if we don't maintain the control with untested additives then it may cause more harm than good.

«Пандемия H1N1» - один из крупнейших фармацевтических скандалов века
H1N1-Pandemien er en af århundredets største medicinalskandaler'

Information, 28 December 2009
https://www.information.dk/udland/2009/12/h1n1-pandemien-aarhundredets-stoerste-medicinalskandaler

Google перевод:

Фармацевтическая промышленность больше не должна диктовать, сколько вакцины следует продавать во время пандемии, заявил председатель комитета Совета Европы по здравоохранению Вольфганг Водарг. В январе комитет исследует влияние фармацевтической промышленности на ВОЗ.

(Фото): египетские дети носят маски, чтобы не заразиться гриппом H1N1. Когда в июне ВОЗ объявила H1N1 пандемией, это вызвало панику во всем мире, и хотя это оказалось всего лишь легким гриппом, страны поспешили купить вакцину против H1N1, и это озолотило фармацевтическую промышленность.

«У нас был легкий грипп – и фальшивая пандемия», – говорит Вольфганг Водарг, председатель комитета Совета Европы по здравоохранению. Немецкий парламентарий также является эпидемиологом и бывшим директором здравоохранения во Фленсбурге, поэтому он внимательно следил за пандемией H1N1 с 11 июня по сегодняшний день. Он называет пандемию «одним из самых громких фармацевтических скандалов века», и именно поэтому поднял этот вопрос в Совете Европы:

«В январе мы проведем экстренные дебаты о влиянии фармацевтической промышленности на ВОЗ, о чем будут проинформированы 47 парламентов Европы. Затем мы начнем контрольное расследование и заслушаем лиц, ответственных за готовность к пандемии», – говорит Вольфганг Водарг.

«Цель состоит в том, чтобы ни одна фармацевтическая компания ни при каких обстоятельствах не могла влиять на готовность к пандемии», – говорит он, добавляя, что необходимо также учитывать положения о патентах:

«Вакцины – это еще и этический вопрос. Препарат, который так важен для нашего общества, что фармацевтическая промышленность не сможет получить патент на его разработку».

Определение пандемии

Уже в 2004 году, во время птичьего гриппа, Вольфганг Водарг (бывший тогда немецким парламентарием от СДПГ) обратился в ВОЗ с просьбой предоставить доказательства необходимости готовности к пандемии:

«Птичий грипп был более опасен, чем H1N1, но гораздо менее заразен, и поэтому аргументы в пользу будущей пандемии были, мягко говоря, слабыми. Но птичий грипп помог создать панику и заставил многие страны подготовиться. Германия, Дания и многие другие страны также закупили большие запасы Тамифлю, хотя он и не был должным образом протестирован», – говорит он, а также критикует контракты на вакцины, которые многие страны заключали в период после птичьего гриппа:

«Государства заключают какие-то контракты с производителями вакцин, по которым заранее размещают заказы и берут на себя практически всю ответственность. Таким образом,

производителям вакцин гарантируется огромный доход без какого-либо финансового риска. Затем они просто ждут, когда ВОЗ скажет «пандемия», и тем самым активируют контракты».

Поэтому Вольфганг Водарг также считает загадочным, что ВОЗ изменила свое определение пандемии на веб-сайте в конце мая этого года:

«С июня 2009 года больше не обязательно, чтобы «огромное количество людей было инфицировано или умерло» – это просто должен быть вирус, который распространяется через национальные границы и к которому у людей нет иммунитета», – говорит он.

Патенты выигрывают

Каждый год появляется новый грипп, поэтому каждый год существующая вакцина смешивается с новым вирусом, чтобы иметь возможность вакцинировать население от нового сезонного гриппа. Вольфганг Водарг считает, что тот же метод можно было бы использовать для гораздо более дешевой вакцинации населения от свиного гриппа:

«Если бы вы просто добавили вирус H1N1 в вакцины против гриппа, которые у нас уже есть, не было бы необходимости в подготовке к пандемии, но некоторые добавки в вакцине запатентованы, и поэтому никто из отрасли не заинтересован в смешивании старую вакцину с новой», – говорит он и добавляет:

«Производители также рекомендовали делать прививки дважды, что тоже ненормально. Само собой разумеется, что они зарабатывают больше денег таким образом. Вот почему некоторые вещи вызвали у меня подозрения.

Нет контроля со стороны ВОЗ

Вольфганг Водарг решил проконсультироваться с остальными членами Совета Европы, потому что ВОЗ действительно не контролирует ситуацию. Только правительства могут иметь влияние через ежегодное собрание ВОЗ. Сегодня в комитете по здравоохранению Совета Европы есть большинство, выступающее за беспристрастное расследование влияния фармацевтической промышленности на ВОЗ.

- В России российский парламентарий предложил бойкотировать ВОЗ до тех пор, пока не будет обеспечена прозрачность. Что ты об этом думаешь?

«Любой, кто обладает эпидемиологическими знаниями, должен был с самого начала усомниться в том, как ВОЗ занимается этим вопросом».

- Кто будет гарантировать, что у нас есть технические знания о вакцинах, если промышленность не будет допущена к участию?

«Это должны быть независимые институты, которые контролируются парламентами государств-членов и которые полностью прозрачны, чтобы общественность могла посмотреть. Они должны установить стандарт того, сколько денег тратится на вакцины. Только в Германии мы потратили 700 миллионов датских крон. евро на подготовку к пандемии, а в Европе – около двух миллиардов. Евро. Это огромные суммы. Но кроме того, вакцины – это еще и этический вопрос. Не должно быть патентов на такую важную вакцину. Любой, у кого есть технические возможности, должен производить вакцины как можно быстрее, когда возникает чрезвычайная ситуация. Таким образом мы сможем спасти больше жизней, когда пандемия действительно произойдет».

- Реально ли полностью вывести отрасль из-под эгиды ВОЗ?

«Нет, и именно поэтому мы должны настаивать на прозрачности. Кроме того, они не должны заседать в комитетах, которые фактически решают, когда у нас будет пандемия и кого следует вакцинировать. Они просто должны ответить, как быстро они могут доставить вакцины. И только тогда, когда их об этом попросят», – говорит Вольфганг Водарг.

- ВОЗ передает 180 миллионов доз странам третьего мира, которые они получили из избыточных запасов стран-членов. Что ты об этом думаешь?

«Я думаю, что это совершенно бессмысленно, и если мы не будем контролировать непроверенные добавки, это может принести больше вреда, чем пользы».

Jim O'Neill

Europe to Investigate the UN Over "Pandemic" Scam

Canada Free Press, 2 January 2010

https://web.archive.org/web/20100206042353/http://www.canadafreepress.com/index.php/article/18527
https://canadafreepress.com/article/europe-to-investigate-the-un-over-pandemic-scam

"UN report says pandemic may result in anarchy – 'could kill millions' – unless western world pays for antiviral drugs and vaccines!" – From "The Guardian" September 20, 2009; =>

Syal R. Swine flu 'could kill millions unless rich nations give £900m'. – The Guardian, 20 September 2009; https://web.archive.org/web/20090923165312/http://www.guardian.co.uk/world/2009/sep/20/swine-flu-costs-un-report

Washington – President Barack Obama has declared the swine flu outbreak a national emergency, giving his health chief the power to let hospitals move emergency rooms offsite to speed treatment and protect non-infected patients. – *Associated Press* – October 25, 2009

https://web.archive.org/web/20091026045602/http://www.msnbc.msn.com/id/33459423/

In addition to the "global warming" rip-off, you can add another huge international racketeering operation – the H1N1 "pandemic" of 2009.

Both of these ploys were designed to fleece the western nations of billions, possibly trillions, of dollars. In the case of the H1N1 scam, the western governments have already coughed up billions of dollars for vaccines to prevent a bogus "pandemic." That means that we, the taxpayers, have been ripped-off yet again.

If class action lawsuits aren't on the way, then they darn well should be. The European nations have apparently not been paid off to the extent of the U.S. Congress, and have decided to look into things.

According to a report filed by F. William Engdahl, the Council of Europe Parliament has unanimously proposed to start an investigation this month into "the influence of the pharmaceutical companies on the global swine flu campaign." => Engdahl FW. European Parliament to Investigate WHO and "Pandemic" Scandal. – Healthcare-in-Europe, 26 January 2010
https://web.archive.org/web/20100103095855/http://www.globalresearch.ca/index.php?context=va&aid=16667

The purpose of the inquiry is to investigate collusion between the "Golden Triangle" of the UN's WHO (World Health Organization), certain pharmaceutical companies, and academic scientists.

That scenario should sound familiar, as it's similar to "global warming's" collusion between the UN's IPCC (Intergovernmental Panel on Climate Change), "green energy" corporations, and academic scientists.

Both scams were intended to "redistribute the wealth" globally, while making the Global Elite, very, very rich. They get to wipe out the middle-class, destroy capitalism, install a UN-run global regime, and get exceedingly wealthy, all at the same time. It's a win/win situation all around, for Progressives at least.

The resolution just passed by the Council of Europe Parliament includes the charge that, "In order to promote their patented drugs and vaccines…pharmaceutical companies influenced scientists and

official agencies…to alarm governments worldwide and make them squander tight health resources for inefficient vaccine strategies and needlessly expose millions of healthy people to the risk of an unknown amount of side-effects of insufficiently tested vaccines.” Council of Europe will investigate and debate on "Faked Pandemic". – Dr. Wodarg, 18 December 2009

https://web.archive.org/web/20100206042353/http://www.wodarg.de/english/2948146.html

The motion was introduced by Dr. Wolfgang Wodarg, Chairman of the European Parliament Health Committee. He stated that millions of healthy people were unnecessarily “exposed to the risk of poorly tested vaccines,” for no other reason than the purported threat of a flu strain that is “vastly less harmful” then previous flu strains.

Dr. Wodarg’s talking about the Swine Flu, or H1N1, or “novel H1N1,” or “2009 H1N1,” or whatever they’re trying to pass it off as these days. You remember – the national emergency?

You ought to remember – after all, you helped to pay for the billions spent on vaccines. Big Pharma thanks you, and so do their stockholders. Speaking of which, do you think some of those stockholders just might be Global Elitists? Just asking.

Moore R. Mass H1N1 vaccination program could cost $18 billion. Lake Land Times, 28 August 2009.

https://web.archive.org/web/20160418114548/http://www.lakelandtimes.com/main.asp?SectionID=9&SubSectionID=9&ArticleID=10046

Dr. Wodarg suggested that, “The Council of Europe and its member-states should ask for immediate investigations and consequences, on their national levels, as well as on the international level.” Consequences – hmmm, good suggestion.

Why isn’t the U.S. doing the same? Too many bribes, too many “donations” made to too many politicians, too many deals made with Big Pharma to get Obama-Care passed? That would be my guess.

Our renowned “people’s watchdog,” the Lame Stream Media, remains ever-vigilantly silent on the subject. Although I must admit that CBS did, almost, nearly look into malfeasance on the part of the CDC (Center for Disease Control) regarding the Swine Flu scam.

Attkisson S. Swine Flu cases overestimated? – CBS News, 21 October 2009

https://web.archive.org/web/20100131030427/http://www.cbsnews.com/stories/2009/10/21/cbsnews_investigates/main5404829.shtml

I guess, once again, it’s up to “we the people” to straighten things out. Anybody know some good class action lawsuit lawyers?

The New American

Alex Newman

Europe to Investigate WHO 'False Pandemic' Scandal

The New American, 5 January 2010
https://thenewamerican.com/world-news/europe/europe-to-investigate-who-false-pandemic-scandal/

The Council of Europe is set to investigate the World Health Organization's swine flu campaign this month over allegations of improper influence from pharmaceutical companies in declaring the H1N1 "pandemic" and the promotion of "inefficient" and potentially dangerous vaccination strategies.

The resolution to launch the emergency inquiry was approved by the Parliamentary Assembly of the Council of Europe (PACE) and passed through the health committee unanimously.

Faked Pandemics – a threat for health. – Parlamentary Assembly, 18 December 2009.
https://web.archive.org/web/20110129183514/http://www2.wodarg.de/uploads/edoc12110.pdf

It states in part that "in order to promote their patented drugs and vaccines against flu, pharmaceutical companies influenced scientists and official agencies responsible for public health standards to alarm governments worldwide and make them squander tight health resources for inefficient vaccine strategies, and needlessly expose millions of healthy people to the risk of an unknown amount of side-effects of insufficiently tested vaccines."

"The 'birds-flu'-campaign (2005/06) combined with the 'swine-flu'-campaign seem to have caused a great deal of damage not only to some vaccinated patients and to public health-budgets, but to the credibility and accountability of important international health-agencies," noted the resolution. "The Council of Europe and its member-states should ask for immediate investigations and consequences on their national levels as well as on the international level. The definition of an alarming pandemic must not be under the influence of drug-sellers."

Leading the charge for the probe is German epidemiologist Dr. Wolfgang Wodarg, the chairman of the PACE health committee and a medical doctor specializing in lung disease. "The victims among millions of needlessly vaccinated people must be protected by their states and independent scientific clarification should provide evidence and transparency for national and – if necessary – European courts," Wodarg said in a statement.

Council of Europe will investigate and debate on "Faked Pandemic". – Dr. Wodarg, 18 December 2009
https://web.archive.org/web/20100206042353/http://www.wodarg.de/english/2948146.html

Wodarg called the "false pandemic" one of the greatest medical scandals of the last century and said that pharmaceutical companies influenced the whole process and needed to be held accountable. They were willing to "inflict bodily harm in their pursuit of profits," he said. Articles in the European press, starting in Denmark and spreading, have repeatedly called into question the myriad ties between vaccine manufacturers and decision makers in the United Nations' global health body.

Voller L, Villesen K. Stærk lobbyisme bag WHO-beslutning om massevaccination. – Information, 16 november 2009. http://www.information.dk/215355

Earlier this year the WHO redefined the term pandemic, lowering the threshold for an emergency declaration by removing the requirement of an "enormous" number of deaths. The WHO estimated that by the end of 2009, around 10,000 people had died from swine flu-linked complications. Seasonal influenza kills between 250,000 and 500,000 per year on average, according to the organization.

News reports earlier this year, citing the UN, warned of millions of deaths around the world unless nations promptly proceeded with the controversial vaccination schemes being promoted by the WHO – along with forking over billions of dollars.

Syal R. Swine flu 'could kill millions unless rich nations give £900m'. – The Guardian, 20 September 2009; https://web.archive.org/web/20090923165312/http://www.guardian.co.uk/world/2009/sep/20/swine-flu-costs-un-report

Since then, the disease has proved relatively mild despite the wild fearmongering campaigns waged by governments, such as the President's Council of Advisors on Science and Technology that warned that 90,000 Americans could die from the H1N1 virus.

=> Newman A. Swine Flu Recedes, Vaccine Supply Grows. – The New American, 2 December 2009. https://web.archive.org/web/20130207005202/http://www.thenewamerican.com/usnews/health-care/item/1689-swine-flu-recedes-vaccine-supply-grows

=> Alex Newman. Dire Swine Flu Warnings from White House. . – The New American, 25 August 2009 https://thenewamerican.com/us/healthcare/dire-swine-flu-warnings-from-white-house/

The incident has reminded people of the avian flu scare. In September of 2005, the chief of the UN's bird flu preparations estimated that the epidemic could cause up to 150 million human deaths. So far, the WHO has confirmed slightly more than 250. The bird flu propaganda campaign will also be investigated by the "urgent" inquiry.

National governments should be ashamed of themselves for squandering billions of taxpayer dollars on an untested, unpopular vaccine for a virus that so far has been extremely mild compared to even the seasonal influenza. Governments are currently trying to get rid of the vaccine supplies. Global health authorities must be held accountable, though it's unfortunate that the charge is being led by a European supranational body instead of national legislatures.

The United States should get involved as well – starting with a complete withdrawal from the UN and its subsidiary bodies. Obama's declaration of a national emergency over swine flu is looking increasingly preposterous. Of course, Congress should also be held accountable for allowing this all to happen in America in the first place, despite the lack of constitutional authority to purchase or promote vaccines. But on the bright side of this whole scandal, citizens may start realizing that government is not a reliable resource for honest and accurate information. *The New American* has been reporting about these issues for months.

Newman A. Swine Flu Recedes, Vaccine Supply Grows. – The New American, 2 December 2009. https://web.archive.org/web/20130207005202/http://www.thenewamerican.com/usnews/health-care/item/1689-swine-flu-recedes-vaccine-supply-grows

NETTAVISEN

Dette er en av århundrets største medisinske skandaler

Nettavisen, 6 January 2010, 17:52
https://www.nettavisen.no/artikkel/dette-er-en-av-arhundrets-storste-medisinske-skandaler/s/12-95-2794492

Har lederen for Europarådets helsekomite, den tyske legen Wolfgang Wodarg, rett når han kaller Verdens helseorganisasjons (WHO) pandemierklæring og vaksinasjonsprogram «en av de største medisinske skandalene i vårt århundre»?
Nå vil Laila Dåvøy i KrF vite om det var legemiddelindustrien som framskyndet WHOs pandemierklæring.

Møter WHO-sjefen
Stortingsrepresentant Laila Dåvøy fra KrF ber helseminister Anne Grete Strøm-Erichsen ta opp dette spørsmålet når hun denne uken møter mektige Margaret Chan, generaldirektør i Verdens helseorganisasjon.

- Det er kommet fram at flere av de som ga råd til WHO i forbindelse med svineinfluensaen hadde økonomiske interesser i legemiddelindustrien. Det er absolutt betimelig at dette spørsmålet blir tatt opp med generalsekretæren. Vi ser nå at frykten for svineinfluensaen var overdrevet, og Norge og andre land sitter med store overskuddslagre av medisin, sier Dåvøy til Nettavisen.

Handlet vaksine for 650 mill. kr
Kristelig Folkepartis helsepolitiske talskvinne peker på at Norge kjøpte inn 9,4 millioner doser med vaksine mot svineinfluensa. Prislappen var på 650 millioner kroner. Nå må Norge og andre land i samme situasjon ta stilling til hva de skal gjøre med overskuddslageret. Dåvøy mener Norge kan gi vaksinen de selv ikke trenger til fattige land, gjennom WHO.

- Kan WHOs håndtering av svineinfluensaen ha vært påvirket av økonomisk interesser?
- Det er det vi ikke vet, og jeg mener det bør granskes. WHO er tryggheten vår, og vi må kunne stole på dem. Jeg har selv ledet et utvalg i WHO-regi og har hatt stor tillit til organisasjonen. Skulle det vise seg at det er andre interesser enn de faglige som styrer beslutningene i WHO, er det desto større grunn til å bli skuffet, sier Dåvøy.

Frankrike kansellerer halvparten
Norge er slett ikke alene om å sitte igjen med store, ubrukte lagre av vaksine. Mandag erklærte Frankrike at de vil vil kansellere 50 millioner av de 94 millioner vaksinedosene landet bestilte. Går flere land til slike skritt, kan det komme til å påvirke inntjeningen til legemiddelprodusentene, sier analytikere ifølge swissinfo.ch.

Den franske regjeringen har fattet sin beslutning etter intens kritikk fra politikere og forskere. Opposisjonen i det franske sosialistpartiet har beskrevet landets pandemihåndtering som en «ekstravagant fiasko» og krevd en gransking i regi av nasjonalforsamlingen.

Medisinsk skandale
Europarådets helsekomite har 25. januar «pandemikampanjen» på dagsorden. Legen Wolfgang Wodarg, som er leder for komiteen, har altså kalt WHOs svineinfluensahåndtering «en av de største medisinske skandalene i vårt århundre».
- Det handler om svært mye penger. Derfor må Strøm-Erichsen ta opp dette på sitt møte med generaldirektør Chan i WHO, sier Dåvøy.

NETTAVISEN

Norwegian MP demands answers from WHO's Dr Chan

Nettavisen // The Flu Case, 7 January 2010
https://web.archive.org/web/20100409094648/http://www.theflucase.com/index.php?option=com_content&view=article&id=2509%3Anorwegian-mp-demands-answers-from-whos-dr-chan-&catid=1%3Alatest-news&Itemid=64&lang=en

"The century's biggest medical scandal"

Is leader of the Council's health committee, the German doctor Wolfgang Wodarg, right when he calls the World Health Organization (WHO) pandemic declaration and vaccination program "one of the biggest medical scandals in this century"?

Meets the WHO Chief

Parliamentary member Laila Daavoey of the Christian Democratic Party has asked Health Minister Anne Grete Stroem-Erichsen to take up this question when she meets the mighty Margaret Chan, Director General of the World Health Organization, this week.

"It is obvious that many of those who gave advice to WHO in connection with the swine flu had economic interests in the pharmaceutical industry. It is certainly timely that this issue is taken up with the Secretary General. We see now that the fears of swine flu were exaggerated, and Norway and other countries are holding large surplus stocks of medicine, " Daavoey told Nettavisen.

Norway is not the only country to be left with large, unused stocks of vaccine. France announced on Monday that it will cancel 50 million of the 94 million vaccine doses ordered for the country. In view of the fact that several countriesare taking such action, it may come to affect earnings at drug makers, said analysts, according swissinfo.ch.

The French government has made its decision after intense criticism from politicians and scientists. The opposition in the French Socialist Party has described the country's pandemic management as an "extravagant failure" and demanded an investigation under the auspices of the National Assembly.

Medical scandal

The Council's health committee has on 25 January the "pandemic campaign" on the agenda. Dr Wolfgang Wodarg, who heads the committee looking into the WHO has called swine flu handling "one of the biggest medical scandals in this century."

- It's about a lot of money. Therefore, Strøm-Erichsen address this at their meeting with the CEO Chan at WHO, said Daavoey.

l'Humanité

[Entretien réalisé par Bruno Odent]

Grippe A. L'implacable réquisitoire du député Wodarg

L'Humanité. 7 January 2010.
https://web.archive.org/web/20100114193203/http://www.humanite.fr/2010-01-07_Societe_Grippe-A-L-implacable-requisitoire-du-depute-Wodarg

Président de la commission santé du Conseil de l'Europe, l'allemand Wolfgang Wodarg a obtenu le lancement d'une enquête de cette instance sur le rôle joué par les laboratoires dans la campagne de panique autour du virus.

Ex-membre du SPD, Wolfgang Wodarg est médecin et épidémiologiste. Il a obtenu à l'unanimité des membres de la commisionn santé du Conseil de l'Europe une commision d'enquête sur le rôle des firmes pharmaceutiques dans la gestion de la grippe A par l'OMS et les états..

Qu'est ce qui a attiré vos soupçons dans la prise d'influence des laboratoires sur les décisions prises à l'égard de la grippe A ?

Wolfgang Wodarg. Nous sommes confrontés à un échec des grandes institutions nationales, chargées d'alerter sur les risques et d'y répondre au cas où une pandémie survient. En avril quand la première alarme est venue de Mexico j'ai été très surpris des chiffres qu'avançait l'Organisation Mondiale de la Santé (OMS) pour justifier de la proclamation d'une pandémie. J'ai eu tout de suite des soupçons: les chiffres étaient très faibles et le niveau d'alarme très élevé. On en était à même pas mille malades que l'on parlait déjà de pandémie du siècle. Et l'alerte extrême décrétée était fondée sur le fait que le virus était nouveau. Mais la caractéristique des maladies grippales, c'est de se développer très vite avec des virus qui prennent à chaque fois de nouvelles formes, en s'installant chez de nouveaux hôtes, l'animal, l'homme etc. Il n'y avait rien de nouveau en soi à cela. Chaque année apparaît un nouveau virus de ce type « grippal ».

En réalité rien ne justifiait de sonner l'alerte à ce niveau. Cela n'a été possible que parce que l'OMS a changé début mai sa définition de la pandémie. Avant cette date il fallait non seulement que la maladie éclate dans plusieurs pays à la fois mais aussi qu'elle ait des conséquences très graves avec un nombre de cas mortels au dessus des moyennes habituelles. On a rayé cet aspect dans la nouvelle définition pour ne retenir que le critère du rythme de diffusion de la maladie. Et on a prétendu que le virus était dangereux car les populations n'avaient pas pu développer de défense immunitaires contre lui. Ce qui était faux pour ce virus. Car on a pu observer que des gens âgés de plus de 60 ans avaient déjà des anticorps. C'est-à-dire qu'ils avaient déjà été en contact avec des virus analogues. C'est la raison pour laquelle d'ailleurs il n'y a pratiquement pas eu de personnes âgées de plus de 60 ans qui aient développé la maladie. C'est pourtant à celles là qu'on a recommandé de se faire vacciner rapidement.

Dans les choses qui ont suscité mes soupçons il y a donc eu d'un côté cette volonté de sonner l'alerte. Et de l'autre des faits très curieux. Comme par exemple la recommandation par l'OMS de procéder à deux injections pour les vaccins. Ça n'avait jamais été le cas auparavant. Il n'y avait aucune justification scientifique à cela. Il y a eu aussi cette recommandation de n'utiliser que des vaccins brevetés particuliers. Il n'existait pourtant aucune raison à ce que l'on n'ajoute pas, comme on

le fait chaque années, des particules antivirales spécifiques de ce nouveau virus H1N1, «complétant» les vaccins servant à la grippe saisonnière. On ne l'a pas fait car on a préféré utiliser des matériaux vaccinales brevetés que les grands laboratoires avaient élaborées et fabriqué pour se tenir prêts en cas de développement d'une pandémie. Et en procédant de cette façon on n'a pas hésité à mettre en danger les personnes vaccinées

Quel danger ?

Wolfgang Wodarg. Pour aller vite dans la mise à disposition des produits on a utilisé des adjuvants dans certains vaccins, dont les effets n'ont pas été suffisamment testés. Autrement dit : on a voulu absolument utiliser ces produits brevetés nouveaux au lieu de mettre au point des vaccins selon des méthodes de fabrication traditionnelles bien plus simples, fiables et moins coûteuses. Il n'y avait aucune raison médicale à cela.Uniquement des raisons de marketing.

Comment a-t-on pu justifier de cela ?

Wolfgang Wodarg.. Pour comprendre il faut en revenir à l'épisode de la grippe aviaire de 2005 - 2006. C'est à cette occasion là qu'ont été définis les nouveaux plans internationaux destinés à faire face à une alarme pandémique. Ces plans ont été élaborés officiellement pour garantir une fabrication rapide de vaccins en cas d'alerte. Cela a donné lieu à une négociation entre les firmes pharmaceutiques et les Etats. D'un côté les labos s'engageaient à se ternir prêts à élaborer les préparations, de l'autre les Etats leur assuraient qu'ils leur achèteraient bien tout cela. Au terme de ce drôle de marché l'industrie pharmaceutique ne prenait aucun risque économique en s'engageant dans les nouvelles fabrications. Et elle était assurée de toucher le jack pot en cas de déclenchement d'une pandémie.

Vous contestez les diagnostics établis et la gravité, même potentielle, de la grippe A ?

Wolfgang Wodarg. Oui, c'est une grippe tout ce qu'il y a de plus normal. Elle ne provoque qu'un dixième des décés occasionnés par la grippe saisonnière classique. Tout ce qui importait et tout ce qui a conduit à la formidable campagne de panique à laquelle on a assisté, c'est qu'elle constituait une occasion en or pour les représentants des labos qui savaient qu'ils toucheraient le gros lot en cas de proclamation de pandémie.

Ce sont de très graves accusations que vous portez là. Comment un tel processus a-t-il été rendu possible au sein de l'OMS ?

Wolfgang Wodarg. Un groupe de personnes à l'OMS est associé de manière très étroite à l'industrie pharmaceutique.

L'enquête du conseil de l'Europe va travailler aussi dans cette direction ?

Wolfgang Wodarg. Nous voulons faire la lumière sur tout ce qui a pu rendre cette formidable opération d'intox. Nous voulons savoir qui a décidé, sur la base de quelles preuves scientifiques, et comment s'est exercé précisément l'influence de l'industrie pharmaceutique dans la prise de décision. Et nous devons enfin présenter des revendications aux gouvernements. L'objectif de la commission d'enquête est qu'il n'y ait plus à l'avenir de fausses alertes de ce genre. Que la population puisse se reposer sur l'analyse, l'expertise des instituions publiques nationales et internationales. Celles ci sont aujourd'hui discréditées car des millions de personnes ont été vaccinés avec des produits présentant d'éventuelles risques pour leur santé. Cela n'était pas nécessaire. Tout cela a débouché aussi sur une gabegie d'argent public considérable.

Avez-vous des chiffres concrets sur l'ampleur de cette gabegie ?

Wolfgang Wodarg. En Allemagne ce sont 700 millions d'euros. Mais il est très difficile de connaître les chiffres précis car on parle maintenant d'un côté de reventes de vaccins à des pays étrangers et surtout les firmes ne communiquent pas, au nom du principe du respect du « secret des affaires » les chiffres des contrats passés avec les Etats et les éventuelles clauses de dédommagements qui y figurent.

Le travail de « lobying » des labos sur les instituts de santé nationaux sera-t-il aussi traité par l'enquête du conseil de l'Europe ?

Wolfgang Wodarg. Oui nous nous pencherons sur l'attitude des instituts comme le Robert Koch en Allemagne ou Pasteur en France qui aurait dû en réalité conseiller leurs gouvernements de façon critique. Dans certains pays des institutions l'ont fait. En Finlande ou en Pologne, par exemple, des voix critiques se sont élevées pour dire : « nous n'avons pas besoin de cela ».

La formidable opération d'intox planétaire n'a-t-elle pas été possible aussi parce que l'industrie pharmaceutique avait «ses représentants» jusque dans les gouvernements des pays les plus puissants?

Wolfgang Wodarg. Dans les ministères cela me paraît évident. Je ne peux pas m'expliquer comment des spécialistes , des gens très intelligents qui connaissent par coeur la problématique des maladies grippales, n'aient pas remarqué ce qui était en train de se produire.

Que s'est-il passé alors ?

Wolfgang Wodarg. Sans aller jusqu'à la corruption directe qui j'en suis certain existe, il y a eu mille manières pour les labos d'exercer leur influence sur les décisions. J'ai pu constater très concrètement par exemple comment Klaus Stöhr qui était le chef du département épidémiologique de l'OMS à l'époque de la grippe aviaire, et qui donc a préparé les plans destinés à faire face à une pandémie que j'évoquais plus haut, était devenu entre temps un haut cadre de la société Novartis. Et des liens semblables existent entre Glaxo ou Baxter (etc) et des membres influents de l'OMS. Ces grandes firmes ont « leurs gens » dans les appareils et se débrouillent ensuite pour que les bonnes décisions politiques soient prises. C'est à dire celles qui leur permettent de pomper le maximum d'argent des contribuables.

Mais si votre enquête aboutit, ne sera-t-elle pas un appui pour les citoyens d'exiger de leurs gouvernements qu'ils demandent des comptes à ces grands groupes ?

Wolfgang Wodarg. Oui, vous avez raison, c'est l'un des grands enjeux lié à cette enquête. Les états pourraient en effet se saisir de cela pour contester des contrats passés dans des conditions, disons, pas très propres. S'il peut être prouvé que c'est la prise d'influence des firmes qui a conduit au déclenchement du processus alors ils faudra les pousser à ce qu'ils demandent à être remboursés. Mais ça c'est uniquement le côté financier, il y a aussi le côté humain, celui des personnes qui ont été vaccinés avec des produits qui ont été insuffisamment testés.

Quel type de risque ont donc pris, sans qu'ils le sachent, ces gens en bonne santé en se faisant vacciner ?

Wolfgang Wodarg.

je le répète les vaccins ont été élaborés trop rapidement, certains adjuvants insuffisamment testés. Mais il y a plus grave. Le vaccin élaboré par la société Novartis a été produit dans un bioréacteur à partir de cellules cancéreuses. Une technique qui n'avait jamais été utilisée jusqu'à aujourd'hui.

Pourquoi, je ne suis évidemment pas un spécialiste, mais comment peut-on prétendre faire un vaccin à partir de cellules malades ?

Wolfgang Wodarg. Normalement on utilise des œufs de poules sur lesquels les virus sont cultivés. On a besoin en effet de travailler sur des cellules vivantes. Car les virus ne peuvent se multiplier que de cette manière et donc, par définition, les préparations antivirus qui vont avec. Mais ce procédé présente un gros défaut, il est lent, il faut beaucoup d'œufs. Et il est long et complexe sur le plan technique. Une autre technique au potentiel remarquable consiste à cultiver les virus sur des cellules vivantes dans des bio-réacteurs. Pour cela il faut des cellules qui croissent et se divisent très vite. C'est un peu le procédé que l'on utilise pour la culture du yaourt que l'on réalise d'ailleurs aussi dans un bio-réacteur. mais dans ce contexte la cellule a été tellement bouleversée dans son environnement et sa croissance qu'elle croit comme une cellule cancéreuse.

Et c'est sur ces cellules au rendement très élevé que l'on cultive les virus. Seulement pour fabriquer le vaccin il faut extraire à nouveau les virus de ces cellules sur lesquelles ils ont été implantés. Et il

peut donc se produire que durant le processus de fabrication du vaccin des restes de cellule cancéreuse demeurent dans la préparation. Comme cela se produit dans la fabrication classique avec les oeufs. On sait ainsi que dans le cas d'une vaccination de la grippe classique des effets secondaires peuvent apparaître chez les personnes qui sont allergiques à l'ovalbumine que l'on trouve dans le blanc d'oeuf. Il ne peut donc pas être exclu que des protéïnes, restes d'une cellule cancéreuse présentes dans un vaccin fabriqué par bio-réacteur, n'engendre une tumeur sur la personne vaccinée. Selon un vrai principe de précaution il faudrait donc, avant qu'un tel produit ne soit autorisé sur le marché, avoir la certitude à 100% que de tels effets sont réellement exclus.

Et cela n'a pas été fait ?

Wolfgang Wodarg. On ne l'a pas fait. L'AME (Agence Européenne du Médicament), une institution sous la responsabilité du commissaire européen à l'économie, basée à Londres, qui donne les autorisations de mise sur le marché des vaccins en Europe, a donné son feu vert à la commercialisation de ce produit en arguant, en l'occurrence, que ce mode de fabrication ne constituait pas un risque « significatif ». Cela a été très différemment apprécié par de nombreux spécialistes ici en Allemagne et une institution indépendante sur le médicament, qui ont au contraire alerté et fait part de leurs objections. J'ai pris ces avertissements au sérieux. J'ai étudié le dossier et suis intervenu dans le cadre de la commission santé du Bundestag dont j'étais alors membre pour que le vaccin ne soit pas utilisé en Allemagne. J'ai fait savoir que je n'étais certainement pas opposé à l'élaboration de vaccins avec cette technique. Mais qu'il fallait d'abord avoir une garantie totale d'innocuité. Le produit n'a donc pas été utilisé en Allemagne où le gouvernement a résilié le contrat avec novartis.

Quel est le nom de ce vaccin ?

Wolfgang Wodarg. Obta flu.

Mais cela veut dire que dans d'autres pays européens comme la France le produit peut être commercialisé sans problème ?

Wolfgang Wodarg. Oui , il a obtenu l'autorisation de l'AME et peut donc être utilisé partout dans l'Union Européenne.

Quelle alternative entendez vous faire avancer pour que l'on échappe à de nouveaux scandales de ce type ?

Wolfgang Wodarg. Il faudrait que l'OMS soit plus transparente, que l'on sache clairement qui décide et quelle type de relation existe entre les participants dans l'organisation. Il conviendrait aussi qu'elle soit au moins flanquée d'une chambre d'élue, capable de réagir de façon très critique où chacun puisse s'exprimer. Ce renforcement du contrôle par le public est indispensable.

N'est ce pas la question d'un autre système capable de traiter une question qui relève en fait d'un bien commun aux citoyens de toute la planète qui affleure ?

Wolfgang Wodarg. Pouvons nous encore laisser la production de vaccins et la conduite de ces productions à des organisations dont l'objectif est de gagner le plus possible d'argent ? Ou bien la production de vaccins n'est-elle pas quelque chose du domaine par excellence , que les Etats doivent contrôler et mettre en œuvre eux même ? C'est la raison pour laquelle je pense qu'il faut abandonner le système des brevets sur les vaccins. C'est à dire la possibilité d'une monopolisation de la production de vaccin par un rand groupe. Car cette possibilité suppose que l'on sacrifie des milliers de vies humaines, simplement au nom du respect de ces droits monopolistiques. Vous avez raison , cette revendication là a pris en tout cas pour moi l'aspect de l'évidence.

l'Humanité

Influenza A - "They Organized the Psychosis"
English translation of the L´Humanité-article

L´Humanité, 7/10 January 2010
https://web.archive.org/web/20110210060355/http://www.wodarg.de/presse/pressespiegel/3022454.html

Exposé: the president of the Council of Europe's Health Commission, German Wolfgang Wodarg, accuses pharmaceutical lobbies and governments. He has obtained the launch of an investigation by the official body he heads on the role played by laboratories in the campaign of panic around the virus. A no-holds-barred interview.

Former member of the German Socialist Party, Wolfgang Wodarg is a physician and epidemiologist. He garnered the Council of Europe's Health Commission members' unanimous consent for a commission of inquiry into the role of pharmaceutical firms in the management of H1N1 flu by the WHO and by governments ...

Bruno Odet for L'Humanité:

What attracted your suspicions about laboratories' undue influence on the decisions taken with respect to influenza A?

Wolfgang Wodarg: We are faced with a failure of the great national institutions charged with alerting us to the risks and responding to them should a pandemic arise. In April, when the first alarm came from Mexico, I was very surprised by the figures the World Health Organization (WHO) was advancing to justify the proclamation of a pandemic. I had suspicions immediately: the figures were quite weak and the level of alarm very elevated. There weren't even a thousand sick people before there was already talk of the pandemic of the century. And the extreme alert decreed was based on the fact that the virus was new. But the characteristic of flu-type illnesses is to develop very fast with viruses that take on new forms each time by moving in on new hosts - animals, people etc. There's nothing new in that. A new "flu" virus of that kind appears every year. In reality, nothing justified sounding the alarm at that level. That was only possible because the WHO changed its definition of pandemic at the beginning of May. Before that date, it was not only necessary that the illness break out in several countries at once, but also that it have very serious consequences, with a number of mortalities in excess of the usual averages. That aspect was erased from the new definition, while the only criterion retained was that of the rate of the illness's diffusion. And it was alleged that the virus was dangerous because populations had not been able to develop immune defenses against it. Which was false for this virus, since we had been able to observe that people over 60 already had antibodies, which is to say that they had already been in contact with analogous viruses. That's why there were practically no people over 60 who developed the illness. Yet, they were the people it was recommended to have be rapidly vaccinated.

Among the things that aroused my suspicions then, there was on the one hand, that desire to sound the alarm - and on the other, very curious facts. Such as, for example, the WHO's recommendation to perform two injections for the vaccinations. That had never been the case before. There was no scientific justification for it. There was also this recommendation to use only specific patented vaccines. Yet, no reason existed for not adding - as is done every year - specific anti-viral particles

of this new H1N1 virus, thus "completing" seasonal flu vaccines. That wasn't done because it was preferred to use patented vaccine material that the big laboratories had elaborated and manufactured to hold in readiness should a pandemic develop. And by proceeding in this fashion, they did not hesitate to put vaccinated persons in danger.

What danger?
Wolfgang Wodarg: To make products quickly available, additives were used in some vaccines the effects of which had not be adequately tested. In other words: people absolutely wanted to use these new patented products instead of perfecting vaccines according to much simpler, more trustworthy and less costly traditional methods of manufacture. There was no medical reason for that - solely marketing reasons.

How were they able to justify that?
Wolfgang Wodarg: In order to understand, we must go back to the avian flu episode of 2005 - 2006. It was on that occasion that the new international plans designed to confront a pandemic alert were mapped out. Officially, those plans were elaborated to guarantee rapid manufacture of vaccine in the event of an alert. That gave rise to negotiations between the pharmaceutical firms and governments. On the one hand, the laboratories committed to hold themselves ready to develop preparations; on the other hand, governments assured the companies that they would really buy all that from them. Pursuant to this phony deal, the pharmaceutical industry took no economic risk by committing to new manufactures. And it was assured of hitting the jackpot should a pandemic break out.

You contest the established diagnoses and the seriousness, even the potential seriousness, of influenza A?
Wolfgang Wodarg: Yes, it's an altogether normal flu. It occasions only a tenth of the deaths caused by classic seasonal flu. All that mattered and all that led to the extraordinary campaign of panic we have witnessed is that it constituted a golden opportunity for lab reps who knew they'd make a mint should a pandemic be proclaimed.

These are very serious accusations you're making. How was such a process within the heart of the World Health Organization made possible?
Wolfgang Wodarg: A group of people at the WHO is very tightly associated with the pharmaceutical industry.

The Council of Europe's inquiry will also work in this direction?
Wolfgang Wodarg: We want to shed light on everything that could have yielded this incredible propaganda campaign. We want to know who decided on the basis of what scientific evidence and exactly how the pharmaceutical industry's influence was exerted in the decision making. And we must ultimately present our claims to the governments. The objective of the commission of inquiry is to assure there be no more false alarms of this type in the future, to assure that the population may rely on the analysis and the expertise of national and international public institutions. Today, those institutions are discredited because millions of people have been vaccinated with products that present possible risks to their health. That was not necessary. Also, that all led to a significant waste of public money.

Do you have concrete numbers on the scope of that waste?
Wolfgang Wodarg: In Germany, it was 700 million euros. But it's very difficult to know the precise figures because on the one hand people are talking about the resale of vaccines to foreign countries and especially because - in the name of the principle of respect for "business secrets" - companies do not communicate the amounts in contracts signed with governments and the possible compensation clauses that figure within them.

Will the Council of Europe investigation also deal with the labs' lobbying of the national institutes of health?

Wolfgang Wodarg: Yes, we shall study the attitude of the institutes, such as the Robert Koch in Germany, or the Pasteur in France, that really should have advised their governments in a critical manner. In some countries, the institutes did just that. In Finland or Poland, for example, critical voices were raised to say: "We don't need that."

Wasn't the incredible planetary propaganda operation possible also because the pharmaceutical industry had "its representative" right inside the governments of the most powerful countries?

Wolfgang Wodarg: In the ministries, that seems obvious to me. I cannot fathom how specialists, highly intelligent people who know the problem of influenza illnesses by heart, didn't notice what was going on.

What happened, then?

Wolfgang Wodarg: Without going so far as direct corruption, which I am certain does exist, there were a thousand ways for the labs to exert their influence over decisions. I have been able to establish very concretely, for example, how Klaus Stöhr, who was head of the epidemiological department at the WHO during the era of the avian flu, and who, therefore, prepared the plans designed to confront a pandemic that I mentioned earlier, became, in the meantime, a senior executive at Novartis. And similar connections exist between Glaxo, Baxter etc. and influential members of the WHO. These big firms had "their people" in the system and managed things afterwards so that the "right" political decisions were made, that is, the decisions that allowed them to pump the maximum amount of money out of the taxpayers.

But if your investigation succeeds, won't it be a prop for citizens to require that their governments demand an accounting from these big groups?

Wolfgang Wodarg: Yes, you are right; it's one of the big issues connected with this investigation. Governments could, in fact, refer to the investigation to contest contracts signed under, let us say, not very clean conditions. If it can be proved that it was the firms' undue influence that led to the onset of the process, then we must push governments until they demand to be reimbursed. But that's solely on the financial side; there's also the human side - that of people vaccinated with inadequately tested products.

What sort of risk did they unknowingly take then, these people in good health who had themselves vaccinated?

Wolfgang Wodarg: I repeat that the vaccines were developed too quickly, some additives inadequately tested. But there are more serious problems. The vaccine developed by Novartis was produced in a bioreactor from cancerous cells, a technique never used before now.

Obviously, I'm not a specialist, but how can someone make a vaccine from sick cells?

Wolfgang Wodarg: Normally, chicken eggs are used as the medium in which the viruses are grown. It's necessary, in fact, to work with live cells, since the virus can multiply in that way only and consequently, by definition, the anti-viral preparations that go with them. But that procedure presents a major flaw; it's slow; it requires many eggs. And it is long and complex on a technical level. Another technique with remarkable potential consists of growing the viruses on living cells in bioreactors. Cells that grow and divide very quickly are required for that. That's approximately the procedure that is used to culture yogurt, which is also made in bioreactors, but in this context the cell has been so disrupted in its environment and its growth that it grows like a cancerous cell. And it's on those high-yield cells that the virus is cultivated. Only to manufacture the vaccine, it is necessary to extract the viruses from those cells into which they have been implanted. And. consequently, it may happen that during the process of manufacturing the vaccine, residues from the cancerous cell remain in the preparation, as happens in the classic manufacture with eggs. So, we know that in the case of a vaccination against classic flu, secondary effects may appear in people allergic to the egg

albumin found in egg whites. Therefore, it cannot be ruled out that protein remains of a cancerous cell present in a vaccine manufactured in a bioreactor give rise to a tumor in the vaccinated person. According to the true precautionary principle, therefore, it should have been necessary before such a product be authorized for commercial use to be 100 percent certain that such effects are actually out of the question.

And that wasn't done?

Wolfgang Wodarg: That was not done. The EMA (European Medicines Agency), an institution based in London under the responsibility of the European Commissioner for the Economy, which gives the authorizations for putting vaccines on the market in Europe, gave its green light for the commercialization of this product, arguing, that, in this case, this manufacturing method did not constitute a "significant" risk. That was evaluated quite differently by numerous specialists here in Germany and by an independent medicine institution: they, on the contrary, raised the alarm and communicated their objections. I took those warnings seriously. I studied the file and intervened within the framework of the Bundestag Health Committee, to which I then belonged, so that the vaccine not be used in Germany. I made it known that I was certainly not opposed to the development of vaccines using that technique, but that it was first of all necessary to guarantee total harmlessness. So, the product was not used in Germany where the government rescinded the contract with Novartis.

What is the name of this vaccine?

Wolfgang Wodarg: Obta flu.

But that means that in other European countries such as France the product may be sold without any problem?

Wolfgang Wodarg: Yes, it obtained EMA authorization and may consequently be used throughout the European Union.

What alternative do you intend to promote so that we escape new scandals of this kind?

Wolfgang Wodarg: The WHO should have to be more transparent so that we clearly know who decides and what kind of relationship exists between the participants in the organization. It would also be appropriate that the WHO at least be supported by an elected chamber, able to react very critically and in which everyone is free to express themselves. This strengthening of public control is indispensable.

But isn't the issue one of another system able to handle a question that in fact relates to the common welfare of all citizens of the planet?

Wolfgang Wodarg: Can we continue to leave the production of vaccines and the conduct of that production to organizations, the objective of which is to earn the most money possible? Or is not the production of vaccines a public domain issue par excellence that governments must control and implement themselves? That's why I think we must abandon the system of patents for vaccines, that is to say, the possibility of some big group monopolizing vaccine production. For that possibility presupposes the sacrifice of thousands of human lives, simply in the name of respect for those monopolistic rights. You are right, that particular demand has taken on - for me, in any case - the aspect of an obvious fact.

Die Starken für die Schwachen
Dr. Wolfgang Wodarg

Jean-Emmanuel Ducoin

Influenza A - "They Organized the Psychosis"

English translation of the L´Humanité-article

L´Humanité, 7/10 January 2010

https://web.archive.org/web/20110210060355/http://www.wodarg.de/presse/pressespiegel/3022454.html

And what if financial waste were to become a scandal of state ... and of many states? By dint of retracing the trail of the anti-influenza A shots, the debate over public policies during a pandemic is being utterly transformed into a vast denunciation of the collusion between laboratories and governments. We hardly doubt that, secretly, while laying low in the shadows, lobbyists did whatever necessary to convince decision makers to buy their vaccinations in massive quantities. Did these servants of the great trusts direct, and in consequence, manipulate the conditions of purchase? The troubling facts that we are publishing [see below] contain that which should arouse our most intense scrutiny. Our questions, moreover, are now shared ... and not by just anybody! The Council of Europe's Health Commission, no less, has, in fact, just voted for an official investigation to evaluate the influence of pharmaceutical groups on governments' and even the World Health Organization's choices .

France is on the front line. And for good reason. Since she's been in office, [French Minster of Health] Mrs. Bachelot and the members of her office, frequently accused of collusion with business circles, have rarely been short of any zeal in rolling out the red carpet for the medicine men listed on the stock exchange. Favoring "complete-vaccination," a variant of Sarkozyist "complete-security," France consequently purchased - without any transparency - far more doses of vaccine than did comparable countries. Moreover, since the summer, the government has been lying to us: the official cost, 869 million euros, is nothing but the tip of the iceberg, to which must be added the purchase of masks, publicity costs and also the exorbitant amount of expenses contributed by local governments, hospitals etc.: probably over 2 billion euros in all! Even the independence of the Groupe d'expertise et d'information sur la grippe [Group for Flu Appraisal and Information] (Geig), an official body of the Ministry of Health, arouses indignation: it is 100 percent financed by five laboratories ...

Ninety-four million doses for five million people who chose to be vaccinated: cherchez the blooper! After having conducted the matter like a Napoleonic battle, the government beats a retreat to the point of negotiating (on what conditions?) the cancellation of half the order for vaccines ... At the hour of reckoning, a wind of panic blows through the Palace. For who will have benefited from this collective hysteria? The laboratories, obviously: spending 870 millions euros on four of them was no longer a precautionary principle, but a veritable financing plan!

The main beneficiaries? GlaxoSmithKline (GSK), Novartis et Sanofi-Aventis: over a billion euros of additional revenues in the fourth quarter for the GSK, between 350 and 500 millions for the two others ... Not only did the organized psychosis fill their coffers, but governments, transformed into super-sales-reps, are taking responsibility for assuring their products' resale! In a global market estimated at 600 billion dollars (it has doubled in ten years), everyone will have understood that for the laboratories the stakes resemble a trade war in which anything is allowed. Who will still dare to say that public control over these private mastodons is not an absolute necessity? The French Parliament would do well to provide itself with a commission of inquiry. And soon.

Pandemic puts pharma under scrutiny

PharmTech, 7 January 2010 [The Flu Case, 8 January 2010]
https://web.archive.org/web/20100220012231/http://www.theflucase.com/index.php?option=com_content&view=article&id=2508%3Apandemic-puts-pharma-under-scrutiny-by-pharmtech&catid=1%3Alatest-news&Itemid=64&lang=en

Pharma companies have been accused by a member of the Council of Europe's Parliamentary Assembly of creating a false pandemic with regards to the H1N1 virus or "swine flu".

Wolfgang Wodarg, Chair of the Health Committee of the European Parliament, and other members of the Parliamentary Assembly have made a motion for a recommendation to the Committee of Ministers of the Council of Europe's Parliamentary Assembly that says member states should ask for "immediate" investigations into the consequences at national and European levels regarding "faked pandemics".

The recommendation states: "In order to promote their patented drugs and vaccines against flu, pharmaceutical companies have influenced scientists and official agencies, responsible for public health standards, to alarm governments worldwide. They have made them squander tight healthcare resources for inefficient vaccine strategies and needlessly exposed millions of healthy people to the risk of unknown side-effects of insufficiently tested vaccines."

Ouch. It's a strong attack on pharma companies, particularly those involved in vaccine manufacture. According to the recommendation, the H1N5 campaign in 2005/2006 combined with the H1N1 campaign in 2009/2010 "seem to have caused a great deal of damage not only to some vaccinated patients and to public health budgets, but also to the credibility and accountability of important national health agencies."

The issue is hammered even harder on Wodarg's website, which includes an interview between Wodarg and Denmark's Information newspaper. In the interview, Wodarg said: "In January, we will arrange an emergency debate about the influence of the pharmaceutical industry on the WHO, and 47 parliaments all over Europe are going to be informed. Following this, we will initiate an investigation and hearings involving those responsible for the pandemic emergency."

The ultimate aim, according to the interview, is that: "none of the pharmaceutical companies under any circumstances must be allowed to make their influence felt on pandemic emergencies."

The motion has not yet been discussed in the Assembly and commits only the members who have signed it. It will now be referred to committees for report and possibly to other committees for opinion.

As of 27 December 2009, the World Health Organization reported that H1N1 cases had occurred in more than 208 countries with at least 12220 deaths.

Debatte über Schweinegrippe-Impfung erreicht Europarat Quelle

Aerzteblatt, 7 Januar 2010

https://web.archive.org/web/20100212165135/www.aerzteblatt.de/v4/news/news.asp?id=39570
www.aerzteblatt.de/v4/news/news.asp?id=39570

Straßburg – Die Kontroverse um die Impfungen gegen Schweinegrippe erreicht nun auch den Europarat. Wie ein Sprecher am Donnerstag bestätigte, wollen Mitglieder der Parlamentarierversammlung Ende Januar Vertreter der Weltgesundheitsbehörde (WHO) und der Pharma-Industrie anhören. Der Unterausschuss Gesundheit hat außerdem eine Dringlichkeitsdebatte zu dem Thema beantragt.

Ziel sei es, eine Untersuchung zu den Hintergründen der von Deutschland und anderen Ländern beschlossenen Massenimpfungen zu erreichen, sagte der Vorsitzende des Unterausschusses, der ehemalige SPD-Bundestagsabgeordnete Wolfgang Wodarg, am Donnerstag.

Wodarg bekräftigte seine Überzeugung, dass Pharmakonzerne gezielt Wissenschaftler und die WHO beeinflusst haben, damit diese vor einer Pandemie warnten. Dies habe dazu geführt, dass viele Staaten Unsummen für überflüssige und zudem potenziell gefährliche, weil ungenügend getestete Impfungen ausgaben. Den Pharmaunternehmen habe die angebliche Pandemie einen "Jackpot" beschert.

Wodarg wirft der WHO zudem vor, nach dem Ausbruch der Vogelgrippe ihre Kriterien für die Ausrufung einer Pandemie geändert zu haben. Ausschlaggebend sei nun nicht mehr die Gefährlichkeit einer Erkrankung, sondern nur die Geschwindigkeit, mit der sich ein Virus ausbreitet. Dadurch sei Panik vor der Schweinegrippe geschürt worden, obwohl diese „erheblich harmloser ist als alle Grippewellen der Vorjahre“. Sie habe bisher „nicht einmal ein Zehntel“ der bei saisonalen Grippen üblichen Todesfälle verursacht.

Der SPD-Politiker möchte erreichen, dass die Parlamentarier-Versammlung einen Berichterstatter mit der Untersuchung beauftragt. Dieser könnte auch der Frage nachgehen, ob die Pharma-Industrie die WHO finanziell unterstützt.

Ob eine Dringlichkeitsdebatte auf die Tagesordnung gesetzt wird, entscheidet das Plenum zum Auftakt der fünftägigen Winter-Sitzung am 25. Januar. Die Anhörung im Ausschuss ist dagegen bereits beschlossen. Sie soll am 28. Januar stattfinden – vermutlich aber unter Ausschluss der Öffentlichkeit. Darauf bestehe die WHO, sagte Wodarg.

Deutschland, Frankreich und andere Länder haben weit mehr Impfdosen bestellt, als sie tatsächlich benötigen. Sie versuchen nun, Bestellungen zu stornieren oder Impfstoffe an andere Länder zu verkaufen. © afp/aerzteblatt.de

THE FLU CASE

Silence from Reuters and AP on upcoming Key Council of Europe Swine Flu Debate Only AFP Reports

The Flu Case, 8 January 2010

https://web.archive.org/web/20100220012225/http://www.theflucase.com/index.php?option=com_content&view=article&id=2507%3Asilence-from-reuters-and-ap-on-upcoming-key-council-of-europe-swine-flu-debate-only-afp-reports&catid=1%3Alatest-news&Itemid=64&lang=en

AFP in Germany is the only wires service so far to report on the upcoming investigation of WHO and pharma representatives over the swine flu vaccine in the parliamentary assembly of the Council of Europe on January 28th.

The session can be watched on the web.

The world's biggest wires service that feed news into countless newspapers and TV outlets, Reuters and AP, have remained silent on the subject.

Thomas Glocer, CEO of thomson Reuters, is also a director of the pharmaceutical company Merck and a member of the Council of Foreign Relations, the Rockefeller think tank from which the idea that a bird flu pandemic was inevitable largely orginated.

Rupert Murdoch's son, James Murdoch, chairman of New Corporation Europe, is a non executive director at GlaxoSmithKline.

Debatte über Schweinegrippe-Impfung erreicht Europarat
– AFP, Gestern, 15:59 Uhr,

Die Kontroverse um die Massen-Impfungen gegen Schweinegrippe erreicht nun auch den Europarat. Wie ein Sprecher am Donnerstag bestätigte, wollen Mitglieder der Parlamentarier-Versammlung Ende Januar Vertreter der Weltgesundheitsbehörde (WHO) und der Pharma-Industrie anhören. Der Unterausschuss Gesundheit hat außerdem eine Dringlichkeitsdebatte zu dem Thema beantragt.

Grippe A. L'implacable réquisitoire du député Wodarg

l'Humanité, 7 janvier 2010
https://web.archive.org/web/20100501235544/http://www.humanite.fr/2010-01-07_Societe_Grippe-A-L-implacable-requisitoire-du-depute-Wodarg

Grippe A. L'implacable réquisitoire du député Wodarg

Président de la commission santé du Conseil de l'Europe, l'allemand Wolfgang Wodarg a obtenu le lancement d'une enquête de cette instance sur le rôle joué par les laboratoires dans la campagne de panique autour du virus.

Ex-membre du SPD, Wolfgang Wodarg est médecin et épidémiologiste. Il a obtenu à l'unanimité des membres de la commisionn santé du Conseil de l'Europe une commision d'enquête sur le rôle des firmes pharmaceutiques dans la gestion de la grippe A par l'OMS et les états..

Qu'est ce qui a attiré vos soupçons dans la prise d'influence des laboratoires sur les décisions prises à l'égard de la grippe A ?

Wolfgang Wodarg. Nous sommes confrontés à un échec des grandes institutions nationales, chargées d'alerter sur les risques et d'y répondre au cas où une pandémie survient. En avril quand la première alarme est venue de Mexico j'ai été très surpris des chiffres qu'avançait l'Organisation Mondiale de la Santé (OMS) pour justifier de la proclamation d'une pandémie. J'ai eu tout de suite des soupçons : les chiffres étaient très faibles et le niveau d'alarme très élevé. On en était à même pas mille malades que l'on parlait déjà de pandémie du siècle. Et l'alerte extrême décrétée était fondée sur le fait que le virus était nouveau. Mais la caractéristique des maladies grippales, c'est de se développer très vite avec des virus qui prennent à chaque fois de nouvelles formes, en s'installant chez de nouveaux hôtes, l'animal, l'homme etc. Il n'y avait rien de nouveau en soi à cela. Chaque année apparaît un nouveau virus de ce type « grippal ». En réalité rien ne justifiait de sonner l'alerte à ce niveau. Cela n'a été possible que parce que l'OMS a changé début mai sa définition de la pandémie. Avant cette date il fallait non seulement que la maladie éclate dans plusieurs pays à la fois mais aussi qu'elle ait des conséquences très graves avec un nombre de cas mortels au dessus des moyennes habituelles. On a rayé cet aspect dans la nouvelle définition pour ne retenir que le critère du rythme de diffusion de la maladie. Et on a prétendu que le virus était dangereux car les populations n'avaient pas pu développer de défense immunitaires contre lui. Ce qui était faux pour ce virus. Car on a pu observer que des gens âgés de plus de 60 ans avaient déjà des anticorps. C'est-à-dire qu'ils avaient déjà été en contact avec des virus analogues. C'est la raison pour laquelle d'ailleurs il n'y a pratiquement pas eu de personnes âgées de plus de 60 ans qui aient développé la maladie. C'est pourtant à celles là qu'on a recommandé de se faire vacciner rapidement. Dans les choses qui ont suscité mes soupçons il y a donc eu d'un côté cette volonté de sonner l'alerte. Et de l'autre des faits très curieux. Comme par exemple la recommandation par l'OMS de procéder à deux injections pour les vaccins. Ça n'avait jamais été le cas auparavant. Il n'y avait aucune justification scientifique à cela. Il y a eu aussi cette recommandation de n'utiliser que des vaccins brevetés particuliers. Il n'existait pourtant aucune raison à ce que l'on n'ajoute pas, comme on le fait chaque années, des particules antivirales spécifiques de ce nouveau virus H1N1, «complétant» les vaccins servant à la grippe saisonnière. On ne l'a pas fait car on a préféré utiliser des matériaux

vaccinales brevetés que les grands laboratoires avaient élaborées et fabriqué pour se tenir prêts en cas de développement d'une pandémie. Et en procédant de cette façon on n'a pas hésité à mettre en danger les personnes vaccinées

Quel danger?

Wolfgang Wodarg. Pour aller vite dans la mise à disposition des produits on a utilisé des adjuvants dans certains vaccins, dont les effets n'ont pas été suffisamment testés. Autrement dit: on a voulu absolument utiliser ces produits brevetés nouveaux au lieu de mettre au point des vaccins selon des méthodes de fabrication traditionnelles bien plus simples, fiables et moins coûteuses. Il n'y avait aucune raison médicale à cela.Uniquement des raisons de marketing.

Comment a-t-on pu justifier de cela ?

Wolfgang Wodarg. Pour comprendre il faut en revenir à l'épisode de la grippe aviaire de 2005 - 2006. C'est à cette occasion là qu'ont été définis les nouveaux plans internationaux destinés à faire face à une alarme pandémique. Ces plans ont été élaborés officiellement pour garantir une fabrication rapide de vaccins en cas d'alerte. Cela a donné lieu à une négociation entre les firmes pharmaceutiques et les Etats. D'un côté les labos s'engageaient à se ternir prêts à élaborer les préparations, de l'autre les Etats leur assuraient qu'ils leur achèteraient bien tout cela. Au terme de ce drôle de marché l'industrie pharmaceutique ne prenait aucun risque économique en s'engageant dans les nouvelles fabrications. Et elle était assurée de toucher le jack pot en cas de déclenchement d'une pandémie.

Vous contestez les diagnostics établis et la gravité, même potentielle, de la grippe A ?

Wolfgang Wodarg. Oui, c'est une grippe tout ce qu'il y a de plus normal. Elle ne provoque qu'un dixième des décés occasionnés par la grippe saisonnière classique. Tout ce qui importait et tout ce qui a conduit à la formidable campagne de panique à laquelle on a assisté, c'est qu'elle constituait une occasion en or pour les représentants des labos qui savaient qu'ils toucheraient le gros lot en cas de proclamation de pandémie.

Ce sont de très graves accusations que vous portez là. Comment un tel processus a-t-il été rendu possible au sein de l'OMS ?

Wolfgang Wodarg. Un groupe de personnes à l'OMS est associé de manière très étroite à l'industrie pharmaceutique.

L'enquête du conseil de l'Europe va travailler aussi dans cette direction ?

Wolfgang Wodarg. Nous voulons faire la lumière sur tout ce qui a pu rendre cette formidable opération d'intox. Nous voulons savoir qui a décidé, sur la base de quelles preuves scientifiques, et comment s'est exercé précisément l'influence de l'industrie pharmaceutique dans la prise de décision. Et nous devons enfin présenter des revendications aux gouvernements. L'objectif de la commission d'enquête est qu'il n'y ait plus à l'avenir de fausses alertes de ce genre. Que la population puisse se reposer sur l'analyse, l'expertise des instituions publiques nationales et internationales. Celles ci sont aujourd'hui discréditées car des millions de personnes ont été vaccinés avec des produits présentant d'éventuelles risques pour leur santé. Cela n'était pas nécessaire. Tout cela a débouché aussi sur une gabegie d'argent public considérable.

Avez-vous des chiffres concrets sur l'ampleur de cette gabegie ?

Wolfgang Wodarg. En Allemagne ce sont 700 millions d'euros. Mais il est très difficile de connaître les chiffres précis car on parle maintenant d'un côté de reventes de vaccins à des pays étrangers et surtout les firmes ne communiquent pas, au nom du principe du respect du «secret des affaires» les chiffres des contrats passés avec les Etats et les éventuelles clauses de dédommagements qui y figurent.

Le travail de « lobying » des labos sur les instituts de santé nationaux sera-t-il aussi traité par l'enquête du conseil de l'Europe ?

Wolfgang Wodarg. Oui nous nous pencherons sur l'attitude des instituts comme le Robert Koch en Allemagne ou Pasteur en France qui aurait dû en réalité conseiller leurs gouvernements de façon critique. Dans certains pays des institutions l'ont fait. En Finlande ou en Pologne, par exemple, des voix critiques se sont élevées pour dire : « nous n'avons pas besoin de cela ».

La formidable opération d'intox planétaire n'a-t-elle pas été possible aussi parce que l'industrie pharmaceutique avait «ses représentants» jusque dans les gouvernements des pays les plus puissants?

Wolfgang Wodarg. Dans les ministères cela me paraît évident. Je ne peux pas m'expliquer comment des spécialistes , des gens très intelligents qui connaissent par coeur la problématique des maladies grippales, n'aient pas remarqué ce qui était en train de se produire.

Que s'est-il passé alors ?

Wolfgang Wodarg. Sans aller jusqu'à la corruption directe qui j'en suis certain existe, il y a eu mille manières pour les labos d'exercer leur influence sur les décisions. J'ai pu constater très concrètement par exemple comment Klaus Stöhr qui était le chef du département épidémiologique de l'OMS à l'époque de la grippe aviaire, et qui donc a préparé les plans destinés à faire face à une pandémie que j'évoquais plus haut, était devenu entre temps un haut cadre de la société Novartis. Et des liens semblables existent entre Glaxo ou Baxter (etc) et des membres influents de l'OMS. Ces grandes firmes ont « leurs gens » dans les appareils et se débrouillent ensuite pour que les bonnes décisions politiques soient prises. C'est à dire celles qui leur permettent de pomper le maximum d'argent des contribuables.

Mais si votre enquête aboutit, ne sera-t-elle pas un appui pour les citoyens d'exiger de leurs gouvernements qu'ils demandent des comptes à ces grands groupes ?

Wolfgang Wodarg. Oui, vous avez raison, c'est l'un des grands enjeux lié à cette enquête. Les états pourraient en effet se saisir de cela pour contester des contrats passés dans des conditions, disons, pas très propres. S'il peut être prouvé que c'est la prise d'influence des firmes qui a conduit au déclenchement du processus alors ils faudra les pousser à ce qu'ils demandent à être remboursés. Mais ça c'est uniquement le côté financier, il y a aussi le côté humain, celui des personnes qui ont été vaccinés avec des produits qui ont été insuffisamment testés.

Quel type de risque ont donc pris, sans qu'ils le sachent, ces gens en bonne santé en se faisant vacciner ?

Wolfgang Wodarg. Je le répète les vaccins ont été élaborés trop rapidement, certains adjuvants insuffisamment testés. Mais il y a plus grave. Le vaccin élaboré par la société Novartis a été produit dans un bioréacteur à partir de cellules cancéreuses. Une technique qui n'avait jamais été utilisée jusqu'à aujourd'hui.

Pourquoi, je ne suis évidemment pas un spécialiste, mais comment peut-on prétendre faire un vaccin à partir de cellules malades ?

Wolfgang Wodarg. Normalement on utilise des œufs de poules sur lesquels les virus sont cultivés. On a besoin en effet de travailler sur des cellules vivantes. Car les virus ne peuvent se multiplier que de cette manière et donc, par définition, les préparations antivirus qui vont avec. Mais ce procédé présente un gros défaut, il est lent, il faut beaucoup d'œufs. Et il est long et complexe sur le plan technique. Une autre technique au potentiel remarquable consiste à cultiver les virus sur des cellules vivantes dans des bio-réacteurs. Pour cela il faut des cellules qui croissent et se divisent très vite. C'est un peu le procédé que l'on utilise pour la culture du yaourt que l'on réalise

d'ailleurs aussi dans un bio-réacteur. mais dans ce contexte la cellule a été tellement bouleversée dans son environnement et sa croissance qu'elle croit comme une cellule cancéreuse.

Et c'est sur ces cellules au rendement très élevé que l'on cultive les virus. Seulement pour fabriquer le vaccin il faut extraire à nouveau les virus de ces cellules sur lesquelles ils ont été implantés. Et il peut donc se produire que durant le processus de fabrication du vaccin des restes de cellule cancéreuse demeurent dans la préparation. Comme cela se produit dans la fabrication classique avec les oeufs. On sait ainsi que dans le cas d'une vaccination de la grippe classique des effets secondaires peuvent apparaître chez les personnes qui sont allergiques à l'ovalbumine que l'on trouve dans le blanc d'oeuf. Il ne peut donc pas être exclu que des protéïnes, restes d'une cellule cancéreuse présentes dans un vaccin fabriqué par bio-réacteur, n'engendre une tumeur sur la personne vaccinée. Selon un vrai principe de précaution il faudrait donc, avant qu'un tel produit ne soit autorisé sur le marché, avoir la certitude à 100% que de tels effets sont réellement exclus.

Et cela n'a pas été fait ?

Wolfgang Wodarg. On ne l'a pas fait. L'AME (Agence Européenne du Médicament), une institution sous la responsabilité du commissaire européen à l'économie, basée à Londres, qui donne les autorisations de mise sur le marché des vaccins en Europe, a donné son feu vert à la commercia-lisation de ce produit en arguant, en l'occurrence, que ce mode de fabrication ne constituait pas un risque «significatif». Cela a été très différemment apprécié par de nombreux spécialistes ici en Allemagne et une institution indépendante sur le médicament, qui ont au contraire alerté et fait part de leurs objections. J'ai pris ces avertissements au sérieux. J'ai étudié le dossier et suis intervenu dans le cadre de la commission santé du Bundestag dont j'étais alors membre pour que le vaccin ne soit pas utilisé en Allemagne. J'ai fait savoir que je n'étais certainement pas opposé à l'élaboration de vaccins avec cette technique. Mais qu'il fallait d'abord avoir une garantie totale d'innocuité. Le produit n'a donc pas été utilisé en Allemagne où le gouvernement a résilié le contrat avec novartis.

Quel est le nom de ce vaccin ?

Wolfgang Wodarg. Obta flu.

Mais cela veut dire que dans d'autres pays européens comme la France le produit peut être commercialisé sans problème ?

Wolfgang Wodarg. Oui , il a obtenu l'autorisation de l'AME et peut donc être utilisé partout dans l'Union Européenne.

Quelle alternative entendez vous faire avancer pour que l'on échappe à de nouveaux scandales de ce type ?

Wolfgang Wodarg. Il faudrait que l'OMS soit plus transparente, que l'on sache clairement qui décide et quelle type de relation existe entre les participants dans l'organisation. Il conviendrait aussi qu'elle soit au moins flanquée d'une chambre d'élue, capable de réagir de façon très critique où chacun puisse s'exprimer. Ce renforcement du contrôle par le public est indispensable.

N'est ce pas la question d'un autre système capable de traiter une question qui relève en fait d'un bien commun aux citoyens de toute la planète qui affleure ?

Wolfgang Wodarg. Pouvons nous encore laisser la production de vaccins et la conduite de ces productions à des organisations dont l'objectif est de gagner le plus possible d'argent ? Ou bien la production de vaccins n'est-elle pas quelque chose du domaine par excellence , que les Etats doivent contrôler et mettre en œuvre eux même ? C'est la raison pour laquelle je pense qu'il faut abandonner le système des brevets sur les vaccins. C'est à dire la possibilité d'une monopolisation de la production de vaccin par un rand groupe. Car cette possibilité suppose que l'on sacrifie des milliers de vies humaines, simplement au nom du respect de ces droits monopolistiques. Vous avez raison , cette revendication là a pris en tout cas pour moi l'aspect de l'évidence.

THE FLU CASE

[Interview by Bruno Odent]

Wolfgang Wodarg's nterview in France's L'Humanite
translated into English by Carolyn Dunning

The Flu Case, 8 January 2010.

Swine flu: "They organized the panic"

New Development: The German President of the Health Committee of the Council of Europe, Wolfgang Wodarg, is issuing accusations against the pharmaceutical lobbies and the governments. He has intitiated the start of an investigation by that body concerning the role played by the pharmaceutical in the campaign of panic about the virus.

A straight forward interview.
Ex-member of the SPD, Wolfgang Wodarg is a doctor and epidemiologist. His request for a commission of inquiry into the role of pharmaceutical companies in the management of swine flu outbreak by WHO and the nation states was granted unanimously by the members of the Health Committee of the Council of Europe…

What made you suspicious about the influence of pharmaceutical companies had on the decisions being taken in respect of swine flu?

Wolfgang Wodarg. We are facing a major failure of national institutions responsible for warning about risks and responding in case a pandemic occurs. In April when the first alarm came from Mexico I was very surprised at the figures furnished by the World Health Organization (WHO) to justify the declaration of a pandemic. I was immediately suspicious: the numbers were very low and the alarm level very high. There were not even in a thousand patients when there was already talk of the pandemic of the century. And the alert was decreed extreme based on the fact that the virus was new. But the characteristic of influenza disease is to develop very quickly with viruses which take on new forms each time, by dwelling in new hosts, animal, human etc.

There was nothing new in itself to that. Each year a new virus of this "flu"type appears. In reality there was no reason to sound the alarm at this level. This was only possible because in early May the WHO changed its definition of a pandemic. Before that date there had to be not only a disease which had broke out in several countries at once but also one that had very serious consequences with the number of deaths above the usual average. This aspect was removed from the new definition, to retain the rate of spread of disease as the only criteria. And they claimed that the virus was dangerous because people had not been able to develop immunity against it. Which was false for this virus. Because it was observed that people aged over 60 years already had antibodies. That is to say they had already been in contact with similar viruses. That is why also there are virtually no people aged over 60 who have developed the disease. Yet those were the people who were recommended to be vaccinated quickly.

Among the things that aroused my suspicions there was therefore on one side this determination to sound the alarm. And on the other side, some curious facts. Such as, for example, the recommendation

by WHO to carry out two injections for vaccines. That had never been done before. There was no scientific justification for this. There was also the recommendation to use only special patented vaccines. There was however no reason for not adding, as it is done every year, specific antiviral particles of this new H1N1 virus, "completing" the vaccine used for seasonal influenza. This was not done because they preferred to use patented vaccine materials that major laboratories had designed and manufactured to be ready in case of a pandemic developing. And by proceeding in this way they did not hesitate to endanger the persons vaccinated.

What danger?

Wolfgang Wodarg. To provide products rapidly, adjuvants were used in some vaccines, whose effects have not been adequately tested. In other words, they wanted absolutely to use these new patented products instead of developing vaccines according to traditional methods of production which are much simpler, more reliable and less costly. There was no medical reason for this. It was only for marketing purposes.

How could anyone justify that?

Wolfgang Wodarg. To understand we must return to the episode of avian influenza from 2005 to 2006. It was then that new international plans were defined for dealing with a pandemic alarm. These plans were officially developed to ensure rapid manufacturing of vaccines in case of an alert. This led to negotiations between pharmaceutical companies and governments. On the one hand the labs committed themselves to keep ready to develop the preparations, on the other hand, states assured them they would buy them all. After this strange deal the pharmaceutical industry took no economic risk by engaging in new fabrications. And it was sure to touch the jack pot in the case of a pandemic outbreak.

Do you disagree with the diagnoses and even the potential severity of influenza A?

Wolfgang Wodarg. Yes, it's just a normal kind of flu. It does not cause a tenth of deaths caused by the classic seasonal flu. All that mattered and that led to the great campaign of panic which we have seen was that it was a golden opportunity for representatives from labs who knew they would hit the jackpot in the case of a pandemic being declared.

Those are very serious accusations you're making. How was such a process made possible within the WHO?

Wolfgang Wodarg. A group of people in the WHO is associated very closely with the pharmaceutical industry.

Will the investigation by the Council of Europe also work in this direction?

Wolfgang Wodarg. We want to clarify everything that brought about this massive operation of disinformation. We want to know who made decisions, on the basis of what evidence and precisely how the influence of the pharmaceutical industry came to bear on the decision-making. And the time has come at last for us to make demands on governments. The purpose of the inquiry is so that there are no more false alarms of this type in the future. So that the people may rely on the analysis and the expertise of national and international public institutions. The latter are now discredited, because millions of people have been vaccinated with products with inherent possible health risks. This was not necessary. It has also led to a considerable mismanagement of public money.

Do you have any concrete figures on the extent of this mismanagement?

Wolfgang Wodarg. In Germany it comes to 700 million euros. But it is very difficult to know the exact figures because we are talking on one side about vaccines resold to foreign countries and most

firms do not communicate due to the principle of respect for "business secret" regarding the amounts in contracts concluded with States and any indemnification clauses contained therein.

Will the work of "lobbying" by pharma companies on the National Institutes of Health also be dealt with by the investigation of the Council of Europe?

Wolfgang Wodarg. Yes we will examine the attitude of institutions like the Robert Koch Institute in Germany or Pasteur in France who should in fact have advised their governments from a critical standpoint. In some countries certain institutions have done so. In Finland and Poland, for example, critical voices were raised to say: "we do not need that."

Has the tremendous global operation of disinformation also been possible because the pharmaceutical industry had "representatives" even within the governments of the most powerful countries?

Wolfgang Wodarg. As regards the ministries, that seems to me to be obvious. I can not explain how specialists, very smart people who know the problems of the influenza disease by heart, did not notice what was happening.

So what happened?

Wolfgang Wodarg. Without going as far as saying direct corruption, which I am certain does exist, there were many ways for labs to exercise their influence over decisions. A very concrete example, is how Klaus Stöhr, who was the head of the epidemiological department of the WHO at the time of bird flu, and who therefore prepared the plans to cope with a pandemic that I mentioned above, in the meantime had become a top executive of the company Novartis. And similar links between Glaxo and Baxter, etc. and influential members of the WHO. These large firms have "their people" in the cogs and then they pull strings so that the right policy decisions are taken. That is to say, the ones that will allow them to pump as much money from taxpayers.

But if your survey succeeds, will it not be a support for citizens to insist their governments demand accountability from these large groups?

Wolfgang Wodarg. Yes, you're right, this is one of the major issues related to this investigation. States could indeed take advantage of this to contest contracts drawn up in, let us say, improper conditions. If it can be shown that it was under the influence of firms that the process was initiated then they will have to be push to ask for reimbursement. But that's just the financial side, there is also the human side, persons who were vaccinated with products that were inadequately tested.

So what kind of risk have these healthy people unknowingly taken by getting vaccinated?

Wolfgang Wodarg. Again, the vaccines were developed too quickly, some adjuvants were insufficiently tested. But there is worse to come. The vaccine developed by Novartis was produced in a bioreactor from cancerous cells. A technique that had never been used until now.

Why, I'm obviously not an expert, but how can one claim to make a vaccine from diseased cells?

Wolfgang Wodarg. Normally one uses chicken eggs on which viruses are grown. We need in fact to work on living cells. Because viruses can only multiply in this way and so do, by definition, the virus preparations that go with it. But this process has a big flaw, it is slow and it takes a lot of eggs. And it is long and complex technically. Another potentially excellent technique is to grow the virus in living cells in bioreactors. This requires cells which grow and divide very quickly. It's a bit like the method used to culture yogurt, which is also produced in a bio-reactor. but in this context the cell was so upset in its environment and its growth that it grows like a cancer cell. And it is on these rapidly multiplying cells that they grow the virus. But to manufacture the vaccine the virus must be re-extracted from these cells on which they were implanted. And it can therefore happen that during

the manufacturing process of the vaccine, residue of cancerous cells remain in the preparation. In the same way as it happens in conventional manufacturing with eggs. Thus we know that in the case of a classic influenza vaccination, side effects can occur in people who are allergic to egg albumin found in egg white. It can not be excluded that proteins, remains of a cancer cell present in a vaccine produced by bio-reactor, may generate a tumour on the person vaccinated. According to a true principle of precaution, before such a product is allowed on the market, there should therefore be 100% certainty that such effects are actually excluded.

And wasn't this done?

Wolfgang Wodarg. It was not. The EMEA (European Medicines Agency), an institution under the responsibility of the European Commissioner for Economic Affairs, based in London, which gives permission to release vaccines on the market in Europe, gave the green light for commercializing this product arguing, namely, that this mode of manufacture was not a "significant" risk. This was very differently appreciated by many experts here in Germany and by an independent drug institution, which instead sounded the alert and voiced their objections. I took these warnings seriously. I studied the case and intervened in the context of the Bundestag health committee of which I was a member so that the vaccine would not be used in Germany. I made it known that I was certainly not opposed to the development of vaccines with this technique. But first it had to have a total guarantee of innocuousness. The product has therefore not been used in Germany where the government terminated the contract with Novartis.

What is the name of this vaccine?

Wolfgang Wodarg. Obta flu.

But that means that in other European countries like France the product can be marketed without any problem?

Wolfgang Wodarg. Yes, it obtained permission from EMEA and can be used anywhere in the EU.

What alternative do you intend to propose so that further scandals of this type are avoided?

Wolfgang Wodarg. The WHO should be more transparent, so we know clearly who decides and what type of relationship exists between participants in the organization. It should also be flanked by at least one elected chamber, which should be able to react very critically and where everyone can express themselves. This enhanced public scrutiny is essential.

Isn't the question of another system capable of handling a matter which is in fact a common good for citizens across the planet coming to the surface?

Wolfgang Wodarg. Can we go on allowing the production of vaccines and the conduct of these productions to organizations whose goal is to win as much money as possible? Or is the production of vaccines not something that States must absolutely monitor and implement themselves? That's why I think we should abandon the system of patents on vaccines. That is to say, the possibility of monopolization of vaccine production by a large group. For this option requires that we sacrifice thousands of lives, simply in the name of respect for these monopoly rights. You're right, that particular claim has become evident for me.

ALJAZEERA

Doubts cast on H1N1 scare

Al Jazeera, 11 January 2010, 19:11 Mecca time, 16:11 GMT
https://web.archive.org/web/20100112052428/http://english.aljazeera.net/news/europe/2010/01/20101111330498806.html

Drug firms made 'false H1N1 claims'
http://www.youtube.com/watch?v=hoQN1to3C2U&feature=player_embedded

The severity of the H1N1 outbreak was deliberately exaggerated by pharmaceutical companies that stood to make billions of dollars from a worldwide scare, a leading European health expert has claimed.

Wolfgang Wodarg, head of health at the Council of Europe, has accused the makers of vaccines for the virus of influencing the World Health Organisation's (WHO) decision to declare a pandemic. The council, a Strasbourg-based body responsible for the European Court of Human Rights, has decided to investigate Wodarg's claims in an emergency debate on the issue to be held later this month.

Wodarg said the crisis led to governments around the world ordering and stockpiling millions of doses of anti-flu drugs which were not needed.

'Inefficient work'

Speaking to Al Jazeera, Wodarg said: "There is a very inefficient work of our agencies. They made a big panic with the bird flu and they made big panic with the swine flu.

"The national governments spent billions of euros to buy their vaccines [for H1N1] so we have to investigate what was behind it, we cannot afford such agencies that spent the money for useless health measures."

In a statement to Al Jazeera, Aphaluck Bhatiasevi, a media officer for WHO, said: "Providing independent advice to member states is a very important function of WHO, we take this work very seriously and guard against the influence of any vested interests.

"We welcome any legitimate review process that can improve our work."

In response to Wodarg's comments, GlaxoSmithKline, one of the makers of H1N1 vaccines, said: "Allegations of undue influence are misguided and unfounded. The WHO declared that H1N1 swine flu met the criteria for a pandemic.

"Responding to it has required unprecedented collaboration. As WHO have stated, legal regulations and numerous safeguards are in place to manage possible conflicts of interest."

THE Sun

Chris Pollard

Swine flu 'false pandemic' claim

The Sun, 11 January 2010
https://web.archive.org/web/20101205211824/http://www.thesun.co.uk/sol/homepage/news/2803049/Swine-flu-false-pandemic-claim.html

A Leading health expert says the swine flu scare was a "false pandemic" led by drugs companies that stood to make billions from vaccines.

Scare ... British students were quarantined in Beijing, China

Wolfgang Wodarg, head of health at the Council of Europe, claims major firms organised a "campaign of panic" to put pressure on the World Health Organisation to declare a pandemic. He believes it is "one of the greatest medicine scandals of the century" – and has called for an inquiry.

An emergency debate on the issue will be held by the Council later this month.

Dr Wodarg said: "It's just a normal kind of flu. It does not cause a tenth of deaths caused by the classic seasonal flu."The great campaign of panic we have seen provided a golden opportunity for representatives from labs who knew they would hit the jackpot in the case of a pandemic being declared."We want to clarify everything that brought about this massive operation of disinformation. We want to know who made decisions, on the basis of what evidence, and precisely how the influence of the pharmaceutical industry came to bear on the decision-making." He added: "A group of people in the WHO is associated very closely with the pharmaceutical industry."

The WHO has recently reaffirmed its stance that the pandemic is not over. However, the number of swine flu deaths is dramatically lower than expected.

Last year, Dr Wodarg raised concerns about swine flu vaccines, saying they could cause dangerous allergic reactions.

In an interview with France's L'Humanite, he said:

"The vaccines were developed too quickly. Some ingredients (adjuvants) were insufficiently tested.

"But there is worse to come. The vaccine developed by Novartis was produced in a bioreactor from cancerous cells – a technique that had never been used until now.

"This was not necessary. It has also led to a considerable mismanagement of public money.

"The time has come at last for us to make demands on governments. The purpose of the inquiry is to prevent more false alarms of this type in the future.

"We must make sure people can rely on the analysis and the expertise of national and international public institutions. The latter are now discredited, because millions of people have been vaccinated with products with inherent possible health risks."

He added: "In Germany this has cost about 700million Euros. But it is very difficult to know the exact figures because we are talking about vaccines resold to foreign countries, and most firms do not communicate due to the principles of 'trade secrets'."

It is believed the British government is desperately trying to offload up to Ł1billion of swine flu vaccine, ordered at the height of the scare.

The Department of Health warned of 65,000 deaths and set up a special advice line and website.

Anti-flu drugs were given out without prescription, and local health authorities were told to prepare for a major outbreak.

Planners were ordered to get morgues ready for the sheer scale of deaths and there were warnings the Army could be called in to prevent riots as people fought to obtain drugs.

But fewer than 5,000 caught the bug last week, and just 251 have died from it overall.

H1N1 Flu Is a False Pandemic, Health Expert Claims

Fox News, 11 January 2010
https://web.archive.org/web/20100114051851/http://www.foxnews.com/story/0,2933,582749,00.html

A leading health expert said the swine flu scare was a "false pandemic" led by drug companies that stood to make billions from vaccines, The Sun reported Monday.

Wolfgang Wodarg, head of health at the Council of Europe, claimed major firms organized a "campaign of panic" to put pressure on the World Health Organization (WHO) to declare a pandemic.

He believes it is "one of the greatest medicine scandals of the century," and he has called for an inquiry.

An emergency debate on the issue will be held by the Council of Europe later this month.

The Council of Europe covers 47 European countries and seeks to develop common and democratic principles between the nations.

Wodarg said, "It's just a normal kind of flu. It does not cause a tenth of deaths caused by the classic seasonal flu.

"The great campaign of panic we have seen provided a golden opportunity for representatives from labs who knew they would hit the jackpot in the case of a pandemic being declared.

"We want to clarify everything that brought about this massive operation of disinformation. We want to know who made decisions, on the basis of what evidence, and precisely how the influence of the pharmaceutical industry came to bear on the decision-making."

He added: "A group of people in the WHO is associated very closely with the pharmaceutical industry."

The WHO recently reaffirmed its stance that the pandemic is not over. However, the number of swine flu deaths is dramatically lower than expected.

In an interview with France's L'Humanite Sunday, Wodarg also raised concerns about swine flu vaccines.

"The vaccines were developed too quickly. Some ingredients were insufficiently tested," he said.

"But there is worse to come. The vaccine developed by Novartis was produced in a bioreactor from cancerous cells, a technique that had never been used until now.

"This was not necessary. It has also led to a considerable mismanagement of public money.

"The time has come at last for us to make demands on governments. The purpose of the inquiry is to prevent more false alarms of this type in the future."

"We must make sure people can rely on the analysis and the expertise of national and international public institutions. The latter are now discredited, because millions of people have been vaccinated with products with inherent possible health risks." => read: The Sun – above

Assemblée parlementaire

PACE winter session: "Faked pandemics, a threat to health"

Is scheduled for Winter session: 25-29 January 2010

Parliamentary Assembly of the Council of Europ, 12 January 2010

https://pace.coe.int/en/news/2707/pace-winter-session-faked-pandemics-a-threat-to-health-

Strasbourg, 12.01.2010 – "Faked pandemics: a threat to health" will be one of the major themes of the next plenary session of the Parliamentary Assembly of the Council of Europe (PACE), to be held in Strasbourg from 25 to 29 January. The PACE Social Affairs Committee has proposed the holding of an urgent debate on this subject. If the Assembly agrees when it adopts its agenda on the opening day, the debate is likely to be held on the morning of Thursday 28 January.

The committee will be holding a closed hearing on the same subject on Tuesday 26 January at 8.30 am, attended by representatives of the World Health Organisation (WHO), the European pharmaceutical industry and experts on the subject.

Other highlights of the session will be the debates on discrimination on the basis of sexual orientation and gender identity, the situation in the Middle East and action against trafficking in human beings.

With Lluís Maria de Puig coming to the end of his term of office, the Assembly is also due to elect a new President. The only candidate to date is Mevlüt Çavusoglu (Turkey, EDG).

Prominent personalities due to address the Assembly include George A. Papandreou, Prime Minister of Greece, Franco Frattini, Minister for Foreign Affairs of Italy, Micheline Calmy-Rey, Head of the Federal Department of Foreign Affairs of Switzerland and Chairperson of the Committee of Ministers of the "47", and Thorbjørn Jagland, Secretary General of the Council of Europe.

The other topics on the agenda include, in particular, respect for media freedom, judicial corruption, the detention of asylum seekers and irregular migrants, and the functioning of democratic institutions in Albania and in Bosnia and Herzegovina.

* * *

Draft agenda

The final agenda is decided by the Assembly on the opening day of the session.

Monday 25 January 2010 (opening at 11.30am)

...

Thursday 28 January

- Possible urgent debate on 'Faked pandemics, a threat to health'
- Rethinking creative rights for the Internet age
- The detention of asylum seekers and irregular migrants in Europe
- Solving property issues of refugees and displaced persons, and statement by Ambassador Wolfgang Petritsch, Former High Representative for Bosnia and Herzegovina
- The functioning of democratic institutions in Albania

Press conferences:

...

A press conference in connection with the hearing on faked pandemics will take place on Tuesday 26 January at 10 am. Other press conferences will be announced on the spot.

WHO to Study H1N1 Response Amid False Pandemic Debate

Bloomberg/Businessweek, 12 January 2010.
http://www.businessweek.com/news/2010-01-12/who-to-review-swine-flu-response-amid-false-pandemics-debate.html

The World Health Organization said it plans to conduct a review of its response to swine flu as policymakers in Europe prepare for an "urgent debate" on the influenza pandemic.

WHO hasn't yet decided when its response to the contagion will be examined because the pandemic is ongoing, said Christy Feig, a WHO spokeswoman in Geneva. Yesterday, the Parliamentary Assembly of the Council of Europe said "false pandemics, a threat to health" will be a major theme of its next plenary session, with a debate slated for Jan. 28.

Health authorities worldwide are assessing whether their response to swine flu is justified by its threat as cases retreat in the U.S. and Western Europe. The new H1N1 virus, which has targeted children and younger adults, has so far resulted in fewer deaths than attributed to seasonal strains, which kills mostly the frail elderly.

"WHO will certainly take a look at how things went and how things could be made better," Feig said in a telephone interview today. "It's not necessarily a reaction to criticism, it's just what you do after a big project."

The U.S., U.K. and Germany are among nations seeking to cut orders of pandemic vaccine from companies including London-based GlaxoSmithKline Plc, Paris-based Sanofi-Aventis SA and Basel, Switzerland-based Novartis AG because of overestimated demand.

'False Pandemic'

Council of Europe parliamentarian Wolfgang Wodarg said last week he and several colleagues had called for a commission of inquiry into a "false pandemic" and the way it was handled at national and European levels, claiming pressure from pharmaceutical firms, Agence France-Presse reported yesterday.

Criticism of those involved in the response to the pandemics isn't unexpected, said Peter Cordingley, a spokesman in Manila for the WHO's Western Pacific region.

"It can be good for public health if criticism highlights a failing of ours," Cordingley said in an e-mail today. "Or it can be harmful if unfounded assertions undermine good public health advice. We expect and indeed welcome criticism and the chance to discuss it."

The WHO moved to the top level of its six-step pandemic alert in June after the discovery of swine flu in Mexico and the U.S. in April. The virus has spread to more than 208 countries and overseas territories, the Geneva-based agency said Jan. 8.

WHO Director-General Margaret Chan is scheduled to brief the agency's executive board on actions taken in the response to the pandemic at a meeting in Geneva starting Jan. 18.

"Once the current pandemic is over, the secretariat will review the experience gained and continue its work to further strengthen the world's state of preparedness for the next pandemic," the WHO's secretariat said in a Dec. 3 report to be presented at next week's meeting.

Swine flu caused madness

Belfast Telegraph, 12 January 2010.
https://web.archive.org/web/20100117042023/http://www.belfasttelegraph.co.uk/opinion/columnists/gail-walker/swine-flu-caused-madness-14632727.html#ixzz0cUywigdy

Well it seems we've all been suckered by the swine flu hysteria. Surprise, surprise!

Swine flu? Remember that? All those confident seemingly scientific scenarios of thousands upon thousands dead and everybody wearing a little mask?

The Government drawing up contingency plans for the Army to quell the rioting as law and order broke down? The morgues ordered to prepare for the pandemic? All round, the end of civilisation as we knew it.

Now Wolfgang Wodarg, head of health at the Council of Europe, has accused the makers of flu drugs and vaccines of hyping up the virus and influencing the World Health Organisation's decision to declare a pandemic.

Calling for an EU inquiry, he described the H1N1 outbreak as “one of the greatest medical scandals of the century. We have had a mild flu – and a false pandemic.”

Swine flu so far has taken the lives of 251 people in Britain. Yes, each death is sad but this is not what we were lead to believe would happen. Millions (billions?) have been wasted.

Money that could – should – have been spent saving lives. Even as the virus winds down, the Government is sitting on up to £1bn of vaccines it cannot get rid off.

The swine flu madness should be an object lesson in the true cost of paying heed to the hysteria merchants for whom the End of the World is always nigh.

Swine Flu Vaccine cut as WHO faces Questions

Terra Daily, 12 January 2010.
https://www.terradaily.com/reports/Swine_Flu_Vaccine_Cut_As_WHO_Faces_Questions_999.html

Geneva (AFP) The World Health Organisation said Tuesday that it was ready to hold an independent review of its response to swine flu, amid growing criticism of official handling of the pandemic.

However, WHO officials said such a review might not be set up until the pandemic is regarded as over, a period which could take months or even years.

"We expect and indeed welcome criticism and a chance to discuss it," WHO spokeswoman Fadela Chaib told journalists.

"In the future we will also do an evaluation of our work with outside experts, in order to assess the work of WHO in the management of the pandemic influenza H1N1," she added.

"Evaluation is necessary and we are open to recommendations that can improve our work, when this is over WHO will undoubtedly work with outside experts."

The UN health agency was still working out the details of such a process.

Council of Europe parliamentarian Wolfgang Wodarg last week said he and several colleagues had called for a commission of inquiry into a "false pandemic" and the way it was handled at national and European levels, claiming pressure from pharmaceutical firms.

Some European countries have been trying to sell off stocks of unused vaccine in recent weeks, after many had geared up to deliver two doses instead of what eventually turned out to be the required single dose.

Chaib denied that the WHO was in conflict with its member states.

WHO flu spokeswoman Nyka Alexander said it could take "several seasons" to determine that a pandemic was over.

"We can't say a pandemic is over until we have seen that it hasn't come back," she explained.

The WHO is also due to open its annual executive board meeting next Monday to a question and answer session from the 34 member states in the body on its management of the A(H1N1) pandemic.

The WHO declared a global pandemic last June, weeks after putting the world on an emergency footing over the sudden discovery and swift spread of the then unknown new swine flu virus in April 2009 in Mexico and the United States.

It now reaches into more than 200 countries having left at least 12,799 people dead, according to the agency's data.

H1N1, the False Pandemic

Pravda // Правда, 13 January 2010 13:21
http://english.pravda.ru/science/health/111631-falsepandemic-0
https://web.archive.org/web/20100116161823/http://english.pravda.ru/science/health/111631-falsepandemic-0

Wolfgang Wodarg, Head of Health at the Council of Europe, considers that the A H1N1 scare was a "campaign of panic", a "false pandemic", "one of the great medicine scandals of the century" and claims that the vaccines, based on cancerous cells, spell the chilling message "there is worse to come".

For Wolfgang Wodarg, the pandemic of A H1N1, which started as Mexican Flu, then Swine Flu, was no more and no less than a campaign to create a false notion of insecurity for the pharmaceutical companies to cash in. "The great campaign of panic we have seen provided a golden opportunity for representatives from labs who knew they would hit the jackpot in the case of a pandemic being declared," he declared.

Claiming that the "pandemic" is "one of the great medicine scandals of the century," Dr. Wodarg has called for an enquiry. The resolution he proposed for an investigation into the role of the pharma companies in the A H1N1 story has been passed by the Council of Europe, which is based in Strasbourg. An emergency debate will be held at the end of January.

"We want to clarify everything that brought about this massive operation of disinformation. We want to know who made decisions, on the basis of what evidence, and precisely how the influence of the pharmaceutical industry came to bear on the decision-making," declared Dr. Wodarg, adding that a group of people in the World Health Organization "is associated very closely with the pharmaceutical industry".

Are the vaccines dangerous?

Regarding the vaccines, Dr. Wodarg delivered some chilling statements in an interview with the French publication L'Humanité on Sunday: "The vaccines were developed too quickly. Some ingredients were insufficiently tested. But there is worse to come. The vaccine developed by Novartis was produced in a bioreactor from cancerous cells, a technique that had never been used until now".

The health expert added that this was not necessary and huge quantities of public money were squandered as a result, developing a vaccine which has not followed the usual processes in place in national and international public institutions: "The latter are now discredited because millions of people have been vaccinated with products with inherent possible health risks".

Pharma companies made billions from mass hysteria

Wolfgang Wodarg further accused the makers of antiflu drugs and vaccines of influencing the WHO's decision to call a global pandemic, facilitating the implanting of mechanisms which in turn generated billions of dollars in profits. The British Department of Health, for example, set up special

procedures, suspended normal rules, told national and local authorities to prepare for 65,000 deaths, prepare the morgues for record numbers of fatalities and instructed the armed forces to be on stand-by.

The result was less than 5,000 cases and 251 deaths, the vast majority of which occurred in patients with serious underlying chronic health problems, or a death rate 260 times less than that expected.

The seeds had been sown

For Dr. Wodarg, the seeds were sown five years ago with the warning that H5N1, avian flu, could develop a human-to-human transmissible form. According to the health expert, Governments then began panic stockpiling for the eventuality of a pandemic and placed “sleeper contracts” which would be activated automatically once a pandemic had been called by the WHO.

For this reason, believes Dr. Wodarg, drug companies placed people inside the WHO mechanisms to facilitate the calling of the pandemic.

CIDRAP

Lisa Schnirring, and Robert Roos

Health officials, experts reject 'false pandemic' charges

CIDRAP, 13 January 2010
https://www.cidrap.umn.edu/h1n1-2009-pandemic-influenza/health-officials-experts-reject-false-pandemic-charges

Jan 13, 2010 (CIDRAP News) – Leading public health officials and experts have sharply rejected charges from some European officials that pharmaceutical companies used exaggerated claims about the H1N1 pandemic threat to scare governments into buying unnecessary stockpiles of vaccines.

The Council of Europe, an organization of 47 nations, said yesterday that the charges will be on the agenda when its Parliamentary Assembly meets in Strasbourg, France, later this month. The assembly's Social Affairs Committee has asked for a debate on the theme "False pandemics: a threat to health," according to a statement on the council's Web site.

The charges, detailed in a proposed resolution, come as the United Kingdom, France, Germany, and other countries are scaling back their vaccine orders. Weak demand for the vaccine in the face of declining flu activity and the need for just one dose have left many countries with surpluses, though public health officials warn that another wave of infections could come this winter.

Dr Wolfgang Wodarg, a German physician and politician who chairs the Council of Europe's health committee, was quoted in the British media as saying the World Health Organization's (WHO's) pandemic declaration last June triggered vaccine contracts with governments and that companies reap financial benefits without taking any risks. He told the London *Daily Mail* that the pandemic H1N1 virus was "a mild flu and a false pandemic."

In the Council of Europe resolution, Wodarg and 13 others charge that pharmaceutical companies have made countries "squander tight health care resources for inefficient vaccine strategies and needlessly exposed millions of healthy people to the risk of unknown side-effects of insufficiently tested vaccines." The group asked the council to investigate the claims.

The WHO has said it would review its pandemic response after the pandemic is over and would field questions related to the proposed Council of Europe resolution at its executive board meeting on Jan 18, according to media reports.

European officials dismiss charges

The proposal has drawn quick and sharp responses from top public health officials. Dr David Salisbury, head of the United Kingdom's immunization program, told the London-based *Guardian* newspaper that though England is in discussions about what to do with its pandemic vaccine surplus, the government must keep a stockpile in case another wave of infections occurs. "If there were a UK resurgence during 2010, we would look very foolish if we had disposed of a valuable stockpile," he told the paper.

In a House of Commons session yesterday, British Health Secretary Andy Burnham faced similar criticism from other lawmakers and defended the government's pandemic preparedness actions, the

Press Association reported. "I would make no apology for making all the necessary preparations to keep the public safe through that. I think we have come through the pandemic because of the strength of the plans and the preparations that this Government put in place," he said.

Also yesterday, Australia's chief medical officer, Dr Jim Bishop, called Wodarg's claims "historically and medically inaccurate," according to NewsCore, an Australian news service. He said the WHO's pandemic declaration was based on cases and deaths in Mexico and the United States and not on pharmaceutical company influence. He also disputed Wodarg's claims that the vaccine was rushed, asserting that Australia's Therapeutic Goods Administration thoroughly assessed the pandemic vaccine.

US experts react

Dr Gregory Poland, MD, director of the Mayo Clinic's Vaccine Research Group in Rochester, Minn., told CIDRAP News that though he has no knowledge of interactions drug companies might have had with governments in Europe, Wodarg's claims are "preposterous."

"The idea that pharmaceutical companies made official agencies squander their resources is ludicrous," he said.

"Vaccine stockpiles are like insurance policies," he said. "You're talking about the health and welfare of entire nations."

However, Poland said he's not surprised by the criticism. Poland said those involved in pandemic planning expect that no matter what they do, some groups will criticize their actions. "Authorities are obligated to prepare for the worst and hope for the best," he said.

Global health officials know that one small mutation in the virus could have turned a relatively mild first pandemic wave into a much more lethal second wave, Poland said, calling the notion that governments have wasted their preparedness resources an unfair criticism. Wodarg's comments "imply a profound lack of insight into public health emergency planning," he said.

Poland said world governments guarantee purchases of pandemic vaccine as a public service that supports flu vaccine production, which is generally not profitable for manufacturers.

A similar backlash if the United States has a big surplus is unlikely, because events like Hurricane Katrina have caused Americans to expect their government to be prepared, he said. Though pockets of antivaccine sentiment exist in the United States, negative perceptions about vaccines might be greater in Europe because of often sensationalized media reports about now-disproven claims of a link between the measles, mumps, and rubella (MMR) vaccine and autism, Poland said

Poland also rejected claims that the WHO was unduly influenced by pharmaceutical companies in declaring a pandemic. He said the WHO takes steps to prevent groups from influencing policy decisions and consults with a pharmaceutical company consortium on manufacturing issues, but not on scientific matters related to the virus and illness.

Criticisms called irresponsible

Another US infectious disease expert, Michael T. Osterholm, PhD, MPH, called the claims of a pharmaceutical industry conspiracy irresponsible and said a third wave of H1N1 cases could quickly soak up any vaccine surpluses.

"It's absolutely irresponsible and plain nonsense," said Osterholm, director of the University of Minnesota's Center for Infectious Disease Research and Policy, publisher of CIDRAP News.

"Unfortunately, it's very easy to make charges like this, which not only undermine the overall ability to respond in the future, but also give the public the sense that public health intentionally exaggerates these potential situations for resources," he said.

"I worry that if these companies end up taking a major economic hit or are brought before a court of public opinion that they'd have every reason to be reluctant in the future to put resources forward for a pandemic vaccine," Osterholm added.

He likened the criticisms to complaining after a category 3 hurricane about having spent the money to build levees for a category 5 event. "I'd much rather be in that position than the other way around," he said.

"We've not written the final obit on this pandemic yet," Osterholm added. "I think many of these officials [who are criticizing the response now] would be questioned if we had a severe third wave. I guarantee that if we have a severe third wave, there won't be a drop of vaccine left."

Another US disease expert, Walter R. Dowdle, MD, a former deputy director of the Centers for Disease Control and Prevention (CDC), declined to comment on the European response to the pandemic, but voiced strong support for the US response. The American approach has generally paralleled that of Western European countries.

"I feel the US did a highly credible job in making early vaccine production and purchasing decisions, assessing and reassessing needs, adjusting high risk definitions, and modifying vaccine recommendations, all as knowledge of the novel H1N1 continued to emerge," said Dowdle, who is director of the Malarone Donation Program and a consultant to the World Health Organization on its polio eradication initiative.

"The fact that the 2009 H1N1 vaccine began to arrive as virus transmission began to decline, as in 1957 and 1968, speaks to the shortcomings of outmoded pandemic vaccine production methodology, not the public health decision making process, he said.

On Dec 3 the WHO issued a statement in response to concerns aired in the media about its advisory body's ties to pharmaceutical industry experts. It said its ties to the companies have many legitimate reasons, including improving global access to medications, vaccines, and diagnostic supplies, all of which can mitigate the impact of a pandemic.

The agency said numerous safeguards are in place to prevent conflicts of interest. For example, the WHO said external experts who advise the WHO are required to declare financial interests that could influence their advice. It added that procedures are in place for identifying and investigating potential conflicts of interest.

The WHO added that the criticisms are understandable but unfounded. It said public perceptions have been influenced by previous planning for a more lethal H5N1 pandemic threat. "Adjusting public perceptions to suit a far less lethal virus has been problematic," the agency said. "Given the discrepancy between what was expected and what has happened, a search for ulterior motives on the part of WHO and its scientific advisers is understandable, though without justification."

THE FLU CASE

WHO said yesterday it will launch an "independent" investigation into its handling of the swine flu pandemic

The Flu Case, 13 January 2010

https://web.archive.org/web/20100220012447/http://www.theflucase.com/index.php?option=com_content&view=article&id=2551%3Awho-says-it-will-investigate-swine-flu-pandemic-when-qoverq&catid=1%3Alatest-news&Itemid=64&lang=en

But a WHO spokesperson said the investigation would only take place after the pandemic had ended, and that this could take months or even years, according to AFP.

WHO has come under increasing criticism for declaring a pandemic emergency over the swine flu for the profit of pharmaceutical companies in spite of the evidence the flu is unusually mild.

In addition, it is not clear who will make the decision to declare the pandemic officially over - just as it is not clear who made the decision to declare a pandemic in June in the first place.

FOCUS online

Kulanter Pharmariese, selbstkritische WHO

Focus, 14 January 2010
https://www.focus.de/gesundheit/ratgeber/schweinegrippe/news/kulanter-pharmariese-selbstkritische-who-schweinegrippe_id_1922606.html

Die Bundesländer müssen nur 34 statt 50 Millionen Impfeinheiten gegen die Schweinegrippe abnehmen. Und die WHO stimmt der Prüfung ihrer H1N1-Strategie zu.

Jetzt ist es beschlossene Sache: Die Bundesländer müssen der Pharmaindustrie weniger Impfstoff gegen die Schweinegrippe abnehmen als ursprünglich vertraglich vorgesehen war. Statt der bestellten 50 Millionen Impfdosen kaufen sie nur 34 Millionen ab. Das bestätigte die Vorsitzende der Gesundheitsministerkonferenz der Länder, Niedersachsens Ressortchefin Mechthild Ross-Luttmann (CDU).

Bundesländer können 133,3 Millionen Euro sparen

Vertreter des Bundes, der Länder und des Impfstoff-Herstellers GlaxoSmithKline (GSK) hatten sich bereits bei ihrem Treffen in der vergangenen Woche auf diesen Kompromiss geeinigt. Die Bundesländer sparen den Angaben zufolge 133,3 Millionen Euro. Ursprünglich hatten die Landesgesundheitsminister Impfstoff für rund 416 Millionen Euro geordert.

Die Länder hatten argumentiert, dass – anders als ursprünglich gedacht – schon eine statt zwei Impfungen ausreichend Schutz gegen das Schweinegrippevirus aufbaut. Trotz des deutlichen Rabatts werden die Länder aber vermutlich auf hohen Kosten sitzen bleiben. Die Krankenkassen übernehmen die Kosten von rund acht Euro pro Impfdosis nur im Fall des tatsächlichen Verbrauchs. Bisher ist nicht einmal ein Drittel der 34 Millionen Dosen in Anspruch genommen worden.

WHO lässt Schweinegrippe-Strategie prüfen

Zeitgleich mit dieser Entscheidung setzte auch die Weltgesundheitsorganisation (WHO) ein neues Zeichen in Sachen Schweinegrippe: Angesichts wachsender Kritik kündigte die Organisation eine unabhängige Untersuchung ihres Umgangs mit der Schweinegrippe an. "*Wir haben mit Kritik gerechnet und sie ist uns willkommen. Wir werden unsere Arbeit später von Experten von außerhalb überprüfen lassen*", erklärte WHO-Sprecherin Fadela Chaïb in Genf. Die Untersuchung sei aber erst nach dem Ende der Pandemie möglich, die noch mehrere Monate oder sogar Jahre andauern kann.

Anhörung vor dem Europarat

Kritiker werfen der WHO vor allem vor, unter dem Druck der Pharmaindustrie voreilig eine Pandemie ausgerufen zu haben. In der vergangenen Woche hatten Abgeordnete des Europarates einen Untersuchungsausschuss gefordert. Ende Januar sind Anhörungen von WHO- und Pharmavertretern geplant. "Wir müssen unsere Lehren ziehen", sagte WHO-Sprecherin Chaïb, "sehen, was wir richtig und was wir falsch gemacht haben, wie wir besser werden und schneller arbeiten können."

Science

Martin Enserink

Facing Inquiry, WHO Strikes Back at "Fake Pandemic" Swine Flu Criticism

Science, 14 January 2010; doi: 10.1126/article.41113
https://www.science.org/content/article/facing-inquiry-who-strikes-back-fake-pandemic-swine-flu-criticism

The chief flu scientist at the World Health Organization (WHO) today defended his agency against criticism that the H1N1 swine flu pandemic was "fake," that its threat to human health was hyped, and that WHO's policies were influenced by vaccine manufacturers who benefited from the pandemic virus. The idea that H1N1 outbreak is not a pandemic is "scientifically wrong and historically inaccurate," WHO's Keiji Fukuda told reporters during a press conference.

With H1N1 apparently on the decline, and the damage much less severe than once feared, many countries are canceling part of their vaccine orders while others are trying to resell unused stocks. As a result, national governments and WHO have come under scrutiny for the way they handled the pandemic.

WHO's chief accuser of late is Wolfgang Wodarg (pictured above left), a German physician and former member of the German Parliament for the Social Democratic Party, who has called the pandemic a "fake" – because the virus isn't very different from existing strains – and who has suggested that big pharma coaxed WHO into declaring a pandemic so that it could produce and sell vaccine. "WHO in cooperation with some big pharmaceutical companies and their re-defined pandemics and lowered the alarm-threshold," Wodarg says in a statement on his Web site.
=> https://web.archive.org/web/20100105042845/http://www.wodarg.de/english/2948146.html

Wodarg – whose resume says he studied medicine in Berlin and Hamburg and was trained in epidemiology at Johns Hopkins University – is also a member of the Parliamentary Assembly of the Council of Europe, and on 18 December he and other members of that group's Social, Health and Family Affairs Committee signed a motion that bluntly stated:

In order to promote their patented drugs and vaccines against flu, pharmaceutical companies have influenced scientists and official agencies, responsible for public health standards, to alarm governments worldwide. They have made them squander tight health care resources for inefficient vaccine strategies and needlessly exposed millions of healthy people to the risk of unknown side-effects of insufficiently tested vaccines.

The Council of Europe is a 47-member organization, unrelated to the European Union, that focuses on promoting human rights and democracy across the continent. Wodarg's motion has been widely covered in the European media, but it's unclear whether it enjoys widespread support. It was signed by only 14 members of the Social, Health and Family Affairs Committee, which has almost 100 members, and was not discussed within that panel.

On its Web site, the Parliamentary Assembly also announces that the topic of "Fake pandemics, a threat to health" will become a prominent discussion topic during its winter session, held from 25–29 January in Strasbourg, France. During a closed-door session on 26 January, members will hear WHO representatives, the pharmaceutical industry, and experts, according to the Web site, but the scope of the inquiry is as yet unclear.

Fukuda today said WHO is happy to testify. But he fiercely denied allegations that the agency has hyped the threat or was influenced by pharmaceutical companies. Early on, WHO stressed that the pandemic was "moderately severe," Fukuda said, but that precautions should be taken for the worst. "We have worked very hard to reduce confusion rather than create it," Fukuda said. He also said that WHO has long-standing conflict-of-interest practices that prevent manufacturers from weighing in on policy decisions. "Has the WHO been influenced by industry? The answer is no," Fukuda said.

As to Wodarg's claim that the pandemic definition was changed to hasten the declaration of a pandemic, Fukuda said that the agency's six-phase alert system was refined a number of times over the years in consultation with scientists, but this did not happen during the pandemic. Actually, WHO was castigated last year for dragging its feet on the pandemic declaration; that didn't come until 11 June, months after many said a pandemic was inevitable.

In an interview with the French communist magazine *l'Humanité* (English translation), Wodarg says he also wants to study the role of scientific organizations like the French Pasteur Institute or the Robert Koch Institute in Germany, which he says should have advised their governments more critically about the decision to purchase vaccines. "In some countries, the institutes did just that," he says. "In Finland or Poland, for example, critical voices were raised to say: "We don't need that."

Fukuda says that the International Health Regulations – a new set of rules to deal with outbreaks that entered into force in 2007 – require a review of how his agency handled the situation as well. That study will be carried with the help of independent experts and the results will be made public, he promised.

CIDRAP

Lisa Schnirring

WHO, vaccine group deny pandemic scare charges

CIDRAP, 14 January 2010

https://www.cidrap.umn.edu/h1n1-2009-pandemic-influenza/who-vaccine-group-deny-pandemic-scare-charges

Jan 14, 2010 (CIDRAP News) – The World Health Organization (WHO) and vaccine makers from Europe today defended themselves against the charges of some European officials that the agency was improperly influenced by vaccine companies and exaggerated the threat of the pandemic H1N1 virus.

Keiji Fukuda, MD, special adviser to the WHO director-general on pandemic flu, told reporters at a press briefing that the WHO welcomes constructive criticism, but said charges of a "false pandemic" by a group of European officials led by Dr Wolfgang Wodarg, a German physician who chairs the Council of Europe's health committee, are "scientifically wrong and historically inaccurate."

Wodarg and 13 others charged in a proposed resolution that pharmaceutical company pressure on the WHO and member countries have led governments to waste healthcare resources and expose their citizens to insufficiently tested vaccines. The action comes as several European countries are cutting back on their vaccine orders because of weak demand, ebbing flu activity, and the need for just one dose per person.

Council debate set for Jan 26

In a related development, the European Vaccine Manufacturers (EVM), a trade group that represents companies such as GlaxoSmithKline, MedImmune, Novartis, and Sanofi, today in a statement rejected the Wodarg group's allegations. "EVM believes that the assertions in this motion are unfounded and result from a misunderstanding of the pandemic planning process and the collaboration between public and private sector partners," the group wrote.

Fukuda and the EVM both said their groups would participate in a Jan 26 Council of Europe debate on the issue. Fukuda said the WHO is currently working to determine what its participation in the debate entails and what information it will be expected to provide. "We're looking forward to participating," he added.

A journalist asked Fukuda if there was any truth to information from the Council of Europe that the WHO doesn't want a public debate on the pandemic topic. He said the charge is false. "The Council of Europe has not asked the WHO if it prefers open or closed door," he said. "WHO has offered no requirement of a closed hearing. We're expecting it to be open."

Despite government talks about scaling back vaccine orders, Fukuda said pandemic flu activity continues at elevated levels in a number of countries. The most intense activity is occurring in North Africa, southern Asia, and parts of eastern and southeastern Europe, he said.

"It remains too early to say the pandemic is over," he said, adding that experts aren't sure if the Northern Hemisphere will experience another wave in the winter or spring or what will happen when Southern Hemisphere countries enter their winter months.

The WHO's experts are still emphasizing the importance of the vaccine in addressing the pandemic threat, with pregnant women and people with chronic medical conditions still at great risk, Fukuda said.

WHO rejects four specific charges

At today's briefing, Fukuda countered each charge made in the Council of Europe resolution. Regarding the questions about whether or not the pandemic is real, "Here the answer is a clear 'yes'," he said. The WHO received its first notification of the new virus in late April, along with clinical information coming out of Mexico and the United States that the novel virus could cause severe, life-threatening infections. "This did send a strong warning that we should be ready for a pandemic," Fukuda said.

By April 29, nine countries had confirmed the novel virus, and by May 11 the virus was found in 74 nations and territories, he said, which is a pattern that defines a pandemic. "At this point, let's not play word games," Fukuda said.

A conservative estimate is that the virus has caused at least 13,000 deaths, he said, adding that the Wodarg group's charges are "somewhat disrespectful to the large numbers of illnesses and deaths and the people who have been working to protect others."

In response to charges that the WHO changed the definition of a pandemic, which may have led countries to overestimate its intensity, Fukuda said though pandemics can differ significantly, the basic idea of worldwide spread is the same. The WHO revised the definition of its pandemic levels in 1999, 2005, and 2009 to clarify them, but it never made severity part of the definition, he said.

Fukuda rejected charges that the WHO has hyped the pandemic. He pointed out that in June 2009 when Director-General Margaret Chan first announced that the world had reached the WHO's highest pandemic level, she emphasized the moderate severity of the disease. He added that the WHO has gone out of its way to say that the future course of the pandemic was uncertain. "This remains as true today as back then," he said.

"No one can afford to sit back and not work to reduce the impact. The WHO has been balanced and sober with its assessments," he said. "We have also pointed out that the severity can increase midstream."

Actions taken by governments, such as ordering vaccine stockpiles, have been the best in history, Fukuda said. "We don't know how they helped mitigate, but we believe they shouldn't be discounted."

Regarding the charge that the WHO was unduly influenced by the pharmaceutical industry, he said officials reached out to a wide variety of sectors. The input of vaccine industry representatives was vital for determining what could be done to expedite production and delivery of a vaccine, he said.

Since well before the pandemic, experts from outside the WHO have been required to declare their professional and financial interests and ties, Fukuda said. "This is shared with members and members of advisory groups. Any allegations of undeclared conflict of interest are investigated immediately by the WHO, and we respond appropriately," he said.

Vaccine group denies influence accusation

In its statement today, the EVM pointed out that governments have been working on pandemic preparedness plans for more than a decade and that other public health partners have been encouraged to respond to the risk of a pandemic.

The EVM said governments have asked the pharmaceutical industry to invest in vaccine research and development, conduct clinical studies, modify production facilities to make pandemic vaccine, and expand manufacturing capacity.

The pandemic declaration in the summer of 2009 called for clear action, the group wrote. "This demanded an unprecedented level of collaboration, involving WHO, national governments, health authorities, regulatory agencies, scientists, healthcare professionals, and private sector companies to facilitate a robust response and deliver the appropriate countermeasures."

Collaborations between outside groups such as vaccine companies and the WHO are governed by the International Health Regulations (IHR) and rigorous safeguards that the WHO outlined in a briefing in early December 2009.

Fukuda said that vaccine stockpiling decisions are left up to each individual country and that the WHO is not privy to the discussion between countries and companies. Vaccine availability is an important consideration, even in the prepandemic setting, he said.

Nations had to make their vaccine decisions before all the details about the virus were known, he said. "Decisions were made in a very sober light, and the actions taken were very prudent. Countries were trying to take all practical steps to minimize harm," Fukuda added.

Response review plans start to take shape

The WHO will review its pandemic response in the future and make the findings public, he said. "The self-review will be similar to any organization that is concerned with the quality of their work. There are lessons to be learned."

He said the IHR also require a review of how well the regulations were implemented during the pandemic. Fukuda added that the IHR review will look at the response of many groups that were involved in pandemic response, not just the WHO.

"We recognize that we need to use these opportunities to improve performance," he said. The WHO's executive board will discuss the assessments at its Jan 18 meeting.

THE FLU CASE

The Questions WHO must answer at its Executive Board Meeting on Monday

The Flu Pandemic, 15 January 2010, 12:50

https://web.archive.org/web/20100220012604/http://www.theflucase.com/index.php?option=com_content&view=article&id=2570%3Athe-questions-who-must-answer-at-its-executive-board-meeting-on-monday&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The controversy surrounding the pandemic will be at the top of the agenda when WHO's Executive Board meets on Monday 18th January.

Members of the public and the press will be able to attend the morning session in Geneva.

The 34 members of the board of governors will be allowed to ask questions concerning WHO's handling of the swine flu pandemic to Dr Keiji Fukuda, Special Adviser on Pandemic Influenza to the Director-General, Dr Margaret Chan, a WHO spokesperson has said.

She confirmed a transcript of the meeting will be made available but she could not say when it would made public.

Among the people attending will be Else Schmidt, top Danish regulator:

"Yesterday there was a public meeting at the Danish Pharmaceutical Faculty at the University of Copenhagen, and md Else Schmidt who is head of prevention at Danish Medical Board (Sundhed-sstyrelsen) said, that she was going to a board meeting at WHO, Geneva next week – and that the pandemic is on the agenda on Monday!"

Some of the questions that need to be asked to Dr Chan and Fukuda on Monday include:

- Who made the decision to relax the criteria for declaraing a pandemic this spring so that lethality was no longer required? On what scientific basis? When?

The explanation given by WHO so far that the criteria for declaring a pandemic were not changed is unsatisfactory since the current criteria would mean that every single seasonal flu would be classified as a pandemic and this is plainly nonsense.

A recent Harvard study has underlined that the swine flu pandemic is milder than the seasonal flu pandemic.

- Who made the decision to declare a pandemic in June? What are the names of the 18 member emergency committee that were responsible for this decision? What links if any do they have with pharmaceutical companies or to bodies such as the Council of Foreign Relations or the Rockefeller Foundation?

- Why were the delegates attending the World Health Assembly in Geneva in May for the annual 64th session not given a chance to debate or vote on the pandemic declaration even though they are supposed to be the governing body?

- Why does Laurie Garrertt of the Council of Foreign Relations report that the WHA delegates were against a pandemic emergency declaration and it took three days of intensive lobbying in June

to push one through? Who did the lobbying? Why? What political or financial interests were involved?

- Why were "experts" allowed to sit on the SAGE vaccine committee with links to pharmaceutical companies? Why were some allowed not to declare their financial interests? Why were so many pharmaceutical company exectuvies attending the meeting as "observers"? Why were no minutes of the meeting taken as WHO claimed?

- Why were vaccines recommended that contain mercury and the adjuvant squalene in spite of the fact there were no adequate clinical safety data on these vaccines?

- Why were clinical trials on these vaccines not performed 3 or 4 years ago when plans to use this new technology were first announced?

- Why use squalene when there is solid scientific evidence that it caused the Gulf War syndrome in US and UK vets?

- Why were pharmaceutical companies given blanket immunity?

- How much money does WHO receive each year from the pharma lobby?

- How much money does EMEA receive from the pharma lobby each year?

- What are the financial or personal links between bodies such as WHO, EMEA and national regulators such as STIKO?

- Why are there so many flaws in the pharmacovigilance system set up to monitor the side effects from the vaccines? Why are doctors reporting large numbers of serious side effects and deaths and the government authorities mainting there are no serious side effects?

- Why is it left to GlaxoSmithKline to conduct these studies in the UK for all the people who have taken Pandemrix? What controls are there on these studies?

- Is it acceptable for "experts" to set background rates for damage, for example, from Guillaine Baree Syndrome and then claim every case of the syndrome reported after a swine flu vaccine is not related to the vaccine because it conforms with the background rate they set?

Can I set a background rate for the number of people killed in my street in Vienna every year, and then go out a run someone down with a car, and say it was not murder because that one person was due to die anyway according to my calculations?

- How can this kind of logic be accepted by WHO? Why were proper clinical trials involcing two control groups not performed since this is the only way of ascertain whether a vaccine causes disprotionately more damage or not?

- If there was no clinical data on the new vaccines, why not just insert a pandemic virus into the regular flu shot?

- Why was so little mention made of alternatives such as the use of face masks etc.

These are just a few of the questions that need to be urgently answered concerning the swine flu pandemic.

Начались слушания о сговоре ВОЗ с фармацевтами

Сегодня в парламентской ассамблее Совета Европы состоятся первые слушания о роли Всемирной организации здравоохранения (ВОЗ) в преувеличении опасности свиного гриппа H1N1 и сговоре с фармацевтическими компаниями о необходимости массовой вакцинации против этой болезни. Парламентарии намерены начать расследование "влияния фармацевтической промышленности внутри ВОЗ".

Инициатором слушаний выступил член комиссии по здравоохранению немецкий врач и эпидемиолог Вольфганг Водарг, который считает историю со свиным гриппом "одним из крупнейших медицинских скандалов века" и обвиняет фармацевтические лаборатории в организации психоза вокруг него. Все это, по его мнению, является прямым следствием "кровосмесительных связей между ВОЗ и фармацевтической промышленностью". Доктор Водарг приводит в пример случай с Клаусом Штером, давно возглавляющим в ВОЗ отделение эпидемиологии и ставшим за это время "высокопоставленным сотрудником компании Novartis". Он также утверждает, что европейская рабочая группа по гриппу, играющая центральную роль в связях ВОЗ с исследовательскими институтами, находится под сильным влиянием компаний Sanofi Pasteur, Novartis, GlaxoSmithKline и Baxter. Кстати, представители этих компаний вызваны для дачи показаний во французском сенате 20 января. Не отстает от них и российская Дума, призвавшая провести расследование по подозрению в коррупции, и в случае если это подтвердится, поставить вопрос о выходе России из ВОЗ.

По подсчетам банка JP Morgan, продажа вакцин против вируса H1N1 принесет фармацевтическим компаниям дополнительную прибыль порядка $7,5-10 млрд. Суть дела, по словам доктора Водарга, состоит в том, что в 2005 году компании обязались провести исследования и быть готовыми к быстрому производству вакцины против птичьего гриппа H5N1. После переговоров "с одной стороны, лаборатории обязались держаться наготове, с другой, правительства заверили, что закупят все. В результате этой странной сделки фармацевтическая промышленность ничем не рисковала". Когда встал вопрос о вакцине против свиного гриппа, компании потребовали, чтобы правительства выполнили свои обязательства. В результате последние оказались в положении, когда использовано всего 13-25% закупленных вакцин и неизвестно, что делать с остальным.

Представителям ВОЗ, старательно уклонявшимся в декабре от ответов на болезненные вопросы, волей-неволей приходится защищаться от обвинений. В разговоре с корреспондентом "Ъ" генеральный директор ВОЗ Маргарет Чан подчеркнула, что "для утверждений, что это якобы не пандемия, нет оснований". "Мы имеем дело с ситуацией, когда очевидно, что новый вирус гриппа H1N1 вызывает устойчивую передачу от человека к человеку в сообществах в 205 странах мира. Новым вирусом заражены миллионы людей, и нам посчастливилось,

что многие из них выздоровели, что в большинстве случаев мы сталкивались с мягкой формой болезни. Число лабораторно подтвержденных случаев смерти вследствие H1N1 превысило 13 тыс. человек, но, по всей вероятности, окончательно цифра будет намного выше. Не думаю, что те, кто потерял кого-то из близких из-за гриппа H1N1, сочтут справедливым утверждение, будто это не пандемия. Так, в Европе очаги гриппа сохраняются на Украине, в Сербии, Турции и Швейцарии. В Африке пик заболеваемости наблюдается в Египте, Алжире, Марокко. В Азии тяжелое положение в Индии, Шри-Ланке. Мы считаем разумным продолжать мониторинг пандемии в ближайшие 6-12 месяцев", – заявила госпожа Чан.

Что касается обвинений, касающихся связей экспертов ВОЗ с фармацевтическими компаниями, доктор Чан заявила, что 18 января организация начнет процесс оценки действий организации по борьбе с пандемией A(H1N1). Специальный совет генерального директора по пандемии гриппа доктор Кэйдзи Фукуда заявил, что сотрудники и внешние эксперты ВОЗ обязаны декларировать свои оплачиваемые услуги фармацевтической промышленности. В случае подозрения на недекларированные связи проводится специальное расследование.

В то же время сама генеральный директор и доктор Фукуда категорически отвергли какую-либо причастность к производству вакцин против гриппа. Учитывая появление нового вируса, организация в соответствии с принятыми Международными медико-санитарными правилами рекомендовала выпуск вакцин против него, но решения о распределении заказов и объемах принимались странами самостоятельно. ВОЗ также с самого начала рекомендовала направлять излишки вакцин в порядке помощи в развивающиеся страны, не имеющие возможности самостоятельно производить или закупать вакцины.

The 'false' pandemic: Drug firms cashed in on scare over swine flu, claims Euro health chief

Daily Mail, 18 January 2010
https://www.dailymail.co.uk/news/article-1242147/The-false-pandemic-Drug-firmscashed-scare-swine-flu-claims-Euro-health-chief.html

The swine flu outbreak was a 'false pandemic' driven by drug companies that stood to make billions of pounds from a worldwide scare, a leading health expert has claimed.

Wolfgang Wodarg, head of health at the Council of Europe, accused the makers of flu drugs and vaccines of influencing the World Health Organisation's decision to declare a pandemic.

This led to the pharmaceutical firms ensuring 'enormous gains', while countries, including the UK, 'squandered' their meagre health budgets, with millions being vaccinated against a relatively mild disease.

A resolution proposed by Dr Wodarg calling for an investigation into the role of drug firms has been passed by the Council of Europe, the Strasbourg-based 'senate' responsible for the European Court of Human Rights.

An emergency debate on the issue will be held later this month.

Dr Wodarg's claims come as it emerged the British government is desperately trying to offload up to £1billion of swine flu vaccine, ordered at the height of the scare.

The Department of Health warned of 65,000 deaths, set up a special advice line and website, suspended normal rules so anti-flu drugs could be given out without prescription and told health and local authorities to prepare for a major pandemic.

Planners were told to get morgues ready for the sheer scale of deaths and there were warnings that the Army could be called in to prevent riots as people fought to obtain drugs.

But with fewer than 5,000 in England catching the disease last week and just 251 deaths overall, Dr Wodarg has branded the H1N1 outbreak as 'one of the greatest medical scandals of the century'.

He said: 'We have had a mild flu - and a false pandemic.'

He added the seeds of the scare were sown five years ago, when it was feared the much more lethal bird flu virus would mutate into a human form.

The 'atmosphere of panic' led to governments stockpiling the anti-flu drug Tamiflu and putting in place 'sleeping contracts' for millions of doses of vaccine

Dr Wodarg said: 'The governments have sealed contracts with vaccine producers where they secure orders in advance and take upon themselves almost all the responsibility.

'In this way the producers of vaccines are sure of enormous gains without having any financial risks.

'So they just wait, until WHO says "pandemic" and activate the contracts.'

He also claims that to further push their interests, leading drug companies placed 'their people' in the 'cogs' of the WHO and other influential organisations.

He added that their influence could have led the WHO to soften its definition of a pandemic - leading to the declaration of a worldwide outbreak last June.

Dr Wodarg said: 'In order to promote their patented drugs and vaccines against flu, pharmaceutical companies have influenced scientists and official agencies, responsible for public health standards, to alarm governments worldwide.

'They have made them squander tight healthcare resources for inefficient vaccine strategies and needlessly exposed millions of healthy people to the risk of unknown side-effects of insufficiently tested vaccines.'

He does not name any Britons with conflicts of interest.

But last year, the Daily Mail revealed that Sir Roy Anderson, a scientist who advises the Government on swine flu, also holds a £116,000-a-year post on the board of GlaxoSmithKline.

GSK makes anti-flu drugs and vaccines and is predicted to be one of the biggest beneficiaries of the pandemic.

The Department of Health says that although the disease appears to be on the wane, it cannot rule out a third surge and urges all those entitled to the jab to have it.

Professor David Salisbury, the Government's head of immunisation said there were 'no grounds whatsoever' for Dr Wodarg's claims, saying people with conflicts of interest were kept out of the decision-making process.

A GSK spokesman said: 'Allegations of undue influence are misguided and unfounded. The WHO declared that H1N1 swine flu met the criteria for a pandemic.

'As WHO have stated, legal regulations and numerous safeguards are in place to manage possible conflicts of interest.'

The company, which still employs Sir Roy, said he had declared his commercial interests and had not attended any meetings related to the purchase of drugs or vaccine for either the Government or GSK.

LE TEMPS

Stéphane Bussard

Les Etats ménagent l'OMS pour éviter leur mea culpa

Le Temps, 18 Janvier 2010 à 23:32
https://www.letemps.ch/monde/etats-menagent-loms-eviter-mea-culpa?srsltid=AfmBOooFYS5kGqG32QkvUOZ1CWNYGXpBD8RW-1oTZDs5VU5_AEju_I28

L'Organisation mondiale de la santé tient son Conseil exécutif jusqu'à vendredi. Les rapports entre l'agence onusienne et l'industrie pharmaceutique font débat

A l'heure où le Conseil exécutif de l'Organisation mondiale de la santé est réuni à Genève pour une semaine, Wolfgang Wodarg continue d'asséner ses critiques au vitriol: «Le problème avec l'OMS, c'est qu'elle a modifié la définition d'une pandémie. Elle a supprimé dans cette même définition la notion de maladies graves et de haute morbidité/mortalité. Du coup, on peut déclarer une pandémie chaque année sur la base d'une simple grippe.»

Population sceptique

Médecin et épidémiologiste, Wolfgang Wodarg est à la tête de ceux qui pensent que l'OMS a surréagi par rapport à la grippe A(H1N1) en raison de ses liens incestueux avec l'industrie pharmaceutique. Celle-ci ayant beaucoup investi d'argent dans la recherche sur les vaccins, elle avait conclu des contrats avec différents Etats qui n'entraient en vigueur qu'en cas de pandémie déclarée.

Membre de la commission Social et Santé du Conseil de l'Europe, le médecin allemand s'est engagé pour qu'une enquête soit menée sur les liens entre les pharmas et l'OMS. Mais aussi entre les scientifiques et l'agence onusienne. «Il n'y a pas que des politiques qui dénoncent la situation, soulève Wolfgang Wodarg. La population elle-même ne croit plus dans les scientifiques. Une preuve? Elle a en grande partie refusé de se faire vacciner.»

Conseiller spécial de la directrice de l'OMS pour la grippe pandémique, Keiji Fukuda réfute toute manipulation du terme pandémie. Il reconnaît que la formulation varie quelque peu d'un cas à l'autre. Mais il rappelle qu'une pandémie répond toujours à la même idée: celle d'une propagation mondiale d'une maladie ou infection. Le conseiller spécial ajoute que l'OMS «n'a jamais inclus dans la définition la sévérité» du virus.

Aujourd'hui, l'ex-député allemand au Bundestag le confie au Temps: «Nous demandons que l'OMS fasse preuve de plus de transparence. Mais elle n'est pas la seule en cause. Les gouvernements nationaux ont aussi leur part de responsabilité. Ils ont aussi échoué à améliorer le mode de fonctionnement de l'OMS.» C'est peut-être la raison pour laquelle les Etats membres de l'OMS ont épargné lundi la directrice de l'OMS, Margaret Chan. La critiquer, c'était risquer l'effet boomerang.

Hier, devant le Conseil exécutif de l'organisation, Margaret Chan a tenu à circonscrire les attaques. Elle a déclaré qu'une commission d'experts indépendants allait évaluer de façon «très large» la réaction de l'OMS à la pandémie et soumettre ses premières conclusions aux ministres de la Santé en mai prochain. La Chinoise a ajouté que la commission analysera le système d'alerte pandémique ainsi que les questions liées à la virulence et à l'étendue géographique du virus. «Il est normal que

chaque décision soit examinée de près, estime Margaret Chan. L'OMS n'opposera aucune restriction à ce type d'investigation.»

La directrice de l'agence onusienne a relevé hier à Genève que l'OMS avait prévu qu'il y aurait des problèmes pour produire des vaccins à temps. Mais elle a reconnu que son organisation n'avait pas «prévu que les gens décideraient de ne pas se faire vacciner. […] Inciter les gens à adopter un comportement sûr est l'un des plus grands défis de santé publique.»

Grands profiteurs

Quoi qu'il en soit, Wolfgang Wodard juge une enquête nécessaire, d'autant que «les pharmas ont été les grands profiteurs de la pandémie». Le membre du Conseil de l'Europe rappelle que tous les Etats n'ont pas cédé à la «psychose» provoquée par l'agence onusienne: «Certains Etats ont refusé l'alarmisme de l'OMS. Des Etats comme la Pologne n'ont pas acheté de vaccins. Le Luxembourg a aussi mis en garde contre tout accès de panique.» En France, les sénateurs vont auditionner mercredi les entreprises pharmaceutiques pour tenter d'y voir clair. Paris avait commandé 94 millions de doses de vaccins avant de résilier certains contrats pour faire taire la polémique qui a éclaté dans l'Hexagone.

THE FLU CASE

National governments must be investigated, not just WHO, says Le Temps

The Flu Case, 19 January 2010, 11:32
https://web.archive.org/web/20100410202140/http://www.theflucase.com/index.php?option=com_content&view=article&id=2602%3Anational-governments-must-be-investigated-not-just-who-says-le-temps&catid=1%3Alatest-news&Itemid=64&lang=en

Is WHO being set up to bear the brunt of the criticism of the swine flu scam in order that national governments can avoid drawing attention to their own complicity? This is the question posed by the headline in Le Temps.

With the exception of the Polish health minister, every single health minister in Europe and every single government head backed the mass swine flu vaccination campaign in spite of the evidence that the jabs were untested and toxic.

French senators are going to question pharmaceutical companies on Wednesday.

But where is the parliamentary inquiry in Germany, for example? Why has none been launched?

WHO could not have implemented its swine flu mass vaccination campaign without the complicity of many agents in national governments, who established national pandemic plans from 2002 onwards.

One of the strongest supporters of these pandemic plans in Germany was Wolfgang Wodarg, who is leading the criticism against WHO while presenting the swine flu scam as mainly for profit.

Why has he not initiated an inquiry in the German parliament? Is it because his own role will come under scrutiny?

THE FLU CASE

WHO's Dr Chan acknowledges world has lost confidence in WHO

The Flu Case, 19 January 2010 11:10

https://web.archive.org/web/20100220012743/http://www.theflucase.com/index.php?option=com_content&view=article&id=2601%3Awhos-dr-chan-acknowledges-world-has-lost-confidence-in-who&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Dr Margaret Chan, Director-General of the World Health Organization, acknowledged that the organisation has lost the trust of the people of the world following mass rejection of the swine flu jab in a speech to the Executive Board yesterday, 18 January 2010.

"We anticipated problems in producing enough vaccine fast enough, and this did indeed happen. But we did not anticipate that people would decide not to be vaccinated," she said.

She attributed the unwillingness of people to take the swine flu jab to "the revolution in communications and information technologies" which has allowed information about the vaccine – specifically the fact it has not been clinically tested and contains dangerous ingredients – to spread on the internet.

"In today's world, people can draw on a vast range of information sources. People make their own decisions about what information to trust, and base their actions on those decisions, "she said.

"The days when health officials could issue advice, based on the very best medical and scientific data, and expect populations to comply, may be fading. It may no longer be sufficient to say that a vaccine is safe, or testing complied with all regulatory standards, or a risk is real."

The widespread recogniton that the WHO and national governments have promoted dangerous vaccines has resulted in a breach in trust that will not be repaired.

Clearly, any advice offered by WHO and national health ministries should be grounded in facts, clinical studies and scientific data that prove that the vaccines are helpful.

In addition, regulatory standards should ensure that only those vaccines that have passed objective scientific tests proving their usefulness should be allowed to be marketed.

This has not been the case.

There is verifiable scientific evidence proving the swine flu vaccines with mercury and squalene are actually harmful.

There is evidence the regulatory standards have been bent and special „emergency" procedures implemented for „pandemic vaccines" simply in order allow those harmful vaccines on the market without adequate clinical studies.

Furthermore, it is evident from WHO's own data there is no pandemic.

Also, WHO cannot change the definition of pandemic to include every seasonal flu, however mild, without itself becoming the target of ridicule.

Evident to everyone is that the new and superfluous global pandemic managment system has been so designed that WHO can only exercise its sweeping new powers under the International Health

Regulations when a pandemic level 6 emergency is declared – and that WHO is distorting every fact and even the definition of the word pandemic to allow just such a declaration for its own political and financial ends.

WHO has sidelined itself from the global health debate.

It has helped set up and profited from a system of global pandemic management that serves no purpose other than to enrich the pharma companies and expand the power of the banksters, who largely fund it.

Pandemics, if they are real, can be managed at a local level with means such as face masks, colloidal silver, vitamins etc.

This is also true of any artificial pandemic that WHO affiliated professors such as Professor Lina conducting research on making the swine flu more like the bird flu might ignite.

"In my view, this is a new communications challenge that we may need to address," Dr Chan says, failing to grasp the gigantic implications of the rejection of the people of the world of the swine flu vaccine in spite of unprecedented media and government propaganda.

People around the world have awoken to the fact that the "communication" from WHO, passed on uncritically by their agents in national governmetns and the mainstream media are dangerous propaganda serving the interests of the pharmaceutical companies and banks.

It has become apparant that WHO is a threat to humanity. It serves the interests of a private and unelected group led largely by the Rockefellers that believe that there are too many people on the planet and it is their duty ot murder us by means of soft kill vaccines.

Dodge & Cox, for example, is one of the main institutional investors in Glaxo Smith Kline, manufacturer of the dangerous pandemrix jab, and a fund set up by Van Duyn Dodge family, related to Edward Seguin van Duyn, an early advocate of planned parenthood, and sterilization.

Because of the threat that WHO represents to the people of the world, especially the developping world where is vast immunization programmes are unsupervised, it needs to be dismantled.

In the last few monts, there have been unprecedented revelations about the depths of corruption and criminality of he UN in respect to climate change scam and of the WHO in respect to the swine flu vaccines.

But the complicity of national governments has also come under the spotlight.

There will be no return to the status quo ante.

The growth of communications and information technology cannot be stopped.

As an Irish person once said, when a good person dies, their voices go on talking forever but when an evil person dies, their voices fall silent, thereby underlining the reality that acts of communication have an inherent bias towards life-promoting values, and the truth.

The WHO and their allied national government will not be able to stop this dynamic of the communication age, especially not now when it's voice has fallen silent on the world stage.

Parliamentary Assembly
Assemblée parlementaire

Public hearing on the handling of the Swine Flu pandemic,
But no urgent debate

PACE, Social, Health and Family Affairs, 21 January 2010
https://web.archive.org/web/20100130094502/http://assembly.coe.int/ASP/NewsManager/EMB_NewsManagerView.asp?ID=5193&L=2

Strasbourg, 21.01.2010 – A public parliamentary hearing titled "The handling of the H1N1 pandemic: more transparency needed?" is to be held on the fringe of the plenary session of the Parliamentary Assembly of the Council of Europe (PACE) in Strasbourg from 8.15-10 a.m. on Tuesday 26 January, immediately followed by a press conference.

The hearing, organised by the Assembly's Committee on Social, Health and Family Affairs, will bring together representatives of the World Health Organisation (WHO) and of European vaccine manufacturers, as well as independent medical experts, to discuss this topic with parliamentarians. Some members of the Assembly – including the outgoing Chair of PACE's Sub-committee on Health Wolfgang Wodarg (Germany, SOC) [1] – requested in a motion in December that the Assembly look into this question.

The hearing is open to the press. Both hearing and press conference will be webcast live.

The Assembly decided on the opening day of the session not to hold an urgent debate on this topic. However, a decision on the follow-up to be given to the motion by Mr Wodarg and 13 other members of the Assembly on this topic is due to made on Friday by the Assembly's Bureau.

[1]. Following the recent parliamentary elections in Germany, Mr Wodarg ceases to be a member of the Assembly, and Chair of its Sub-committee on Health, on Monday 25 January. He will attend the hearing in an expert capacity.

Practical arrangements

The hearing takes place from 8.15a.m. to 10a.m. in Room 1 of the Palais de l'Europe in Strasbourg, and is open to the press.

Media interested in attending are invited to request accreditation from Danielle Schreiber-Somoza of the Council of Europe's Communication Directorate, e-mail danielle.schreiber-somoza@coe.int, tel. +33 3 88 41 25 44.

Video of both the hearing and the following press conference – in the original language and interpreted into English and French – will be webcast live via the following link: http://tv.coe.int/internet/press.html. Video recordings will also be available for download later.

If an urgent debate takes place on Thursday morning, this will also be webcast live from the following link: http://tv.coe.int/internet. Additional documentation is available on the Assembly's website http://assembly.coe.int.

For further information, please contact Micaela Catalano, Francesc Ferrer, Angus Macdonald or Nathalie Bargellini of PACE's Communication Division on e-mail pace.com@coe.int, tel. +33 (0)3 88 41 31 93.

World Health Organization

Statement of the World Health Organization on allegations of conflict of interest and 'fake' pandemic

Geneva, WHO, 22 January 2010

https://web.archive.org/web/20100411061002/http://www.who.int/mediacentre/news/statements/2010/h1n1_pandemic_20100122/en/index.html

Providing independent advice to Member States is a very important function of the World Health Organization (WHO). We take this work seriously and guard against the influence of any improper interests. The WHO influenza pandemic policies and response have not been improperly influenced by the pharmaceutical industry.

WHO recognizes that global cooperation with a range of partners, including the private sector, is essential to pursue public health objectives today and in the future. Numerous safeguards are in place to manage conflicts of interest or perceived conflicts of interest among members of WHO advisory groups and expert committees. Expert advisers provide a signed declaration of interests to WHO detailing any professional or financial interest that could affect the impartiality of their advice. WHO takes allegations of conflict of interest seriously and is confident of its decision-making independence regarding the pandemic influenza.

Additional allegations that WHO created a 'fake' pandemic to bring economic benefit to industry are scientifically wrong and historically incorrect.

- Lab analyses showed that this influenza virus was genetically and antigenically very different from other influenza viruses circulating among people
- Epidemiological information provided by Mexico, the US and Canada demonstrated person-to-person transmission.
- Clinical information, especially from Mexico, indicated this virus also could cause severe disease and death. At the time, those reports did not indicate a pandemic situation, but taken together sent a very strong warning to WHO and other public health authorities to be ready for one.
- As the pandemic evolved, clinicians identified a very severe form of primary viral pneumonia, which was rapidly progressive and frequently fatal, that is not part of the disease pattern seen during seasonal influenza. While these cases were relatively rare, they imposed a heavy burden on intensive care units.
- Geographical spread was exceptionally rapid.
    - On 29 April 2009, WHO reported lab confirmed cases in 9 countries.
    - About 6 weeks later, on 11 June, WHO reported cases in 74 countries and territories in more than two WHO regions. It is this global spread which led WHO to call for increasing phases and finally, to announce that a pandemic was underway.
    - By 1 July, infections had been confirmed in 120 countries and territories.

The world is going through a real pandemic. The description of it as a fake is wrong and irresponsible. We welcome any legitimate review process that can improve our work.

An explanation of how WHO uses advisory bodies in responding to the influenza pandemic was made publicly available on the WHO web site on 3 December 2009.

CIDRAP

Lisa Schnirring

WHO defends pandemic response ahead of Europe hearing

CIDRAP, 25 January 2010

https://www.cidrap.umn.edu/h1n1-2009-pandemic-influenza/who-defends-pandemic-response-ahead-europe-hearing

Jan 25, 2010 (CIDRAP News) – Just days before a Council of Europe hearing to discuss claims that pharmaceutical companies influenced the World Health Organization's (WHO's) pandemic response, the global body said charges by some European officials that the pandemic is "fake" are "wrong and irresponsible."

In a Jan 22 statement sent to journalists today, the WHO said cooperation from a range of partners, including the private sector, is needed to conduct essential public health actions and it has safeguards in place to guard against conflicts of interest.

In December a Council of Europe group, headed by Dr Wolfgang Wodarg, a German physician and politician who chairs council's health committee, introduced a resolution asking the council to investigate charges that pharmaceutical companies have pressured countries to waste resources on inefficient immunization campaigns using vaccines that they say haven't been thoroughly tested.

The Council of Europe, an organization of 47 nations, will conduct a public hearing titled, "The handling of the H1N1 pandemic: more transparency needed?" tomorrow on the second day of its parliamentary assembly in Strasbourg, France, according to information posted on the group's Web site.

The council will conduct the hearing alongside its plenary session. The hearing and a press conference to follow will be streamed live on the council's Web site.

According to the council's agenda, presentations will be made by Wodarg; Dr Keiji Fukuda, special advisor on pandemic influenza to the WHO director-general, Dr Luc Hessel from the European Vaccine Manufacturers; and Dr Ulrich Keil, who directs the WHO's collaborating center in Munster, Germany.

The Council of Europe's move to air the Wodarg group's criticism of the WHO and pharmaceutical companies came as several European nations started scaling back their vaccine orders. Weak demand for the vaccine in the face of declining flu activity and the need for just one dose have left many countries with surpluses

The Council of Europe's Social Affairs Committee had asked for a debate on the theme "False pandemics: a threat to health," according to a statement on the council's Web site. The information had suggested that a separate debate on this topic would take place Jan 28, but an update on the site said the assembly, during its opening session today, decided not to hold the debate and voted to address the issue again on Jan 29, the last day of its parliamentary assembly.

The WHO statement said that allegations by the Council of Europe and other critics that the WHO created a "fake" pandemic to provide a financial windfall from pharmaceutical companies is "scientifically wrong and historically inaccurate."

It pointed out that a lab analysis showed the novel H1N1 virus was genetically and antigenically distinct from other flu viruses that were circulating in human populations. Documented cases of person-to-person transmission and clinical reports from Mexico that the virus could cause severe disease and deaths served as pandemic red flags to the WHO and other public health authorities.

As the virus started to spread quickly across the globe, clinicians found that the virus could cause a very severe primary viral pneumonia that progressed rapidly, was frequently fatal, and was not a pattern seen with seasonal flu, the WHO said. "While these cases were relatively rare, they imposed a heavy burden on intensive care units."

When the Wodarg group's claims surfaced, some government public health officials in England and Australia defended vaccine stockpiling as a prudent public health response and said vaccination efforts should continue to protect against another potential wave of infection. Some medical experts in the United States called the charges "preposterous" and worried about a backlash that would impair future emergency response actions.

World Health Organization

Statement by Dr Keiji Fukuda on behalf of WHO at the Council of Europe hearing on pandemic (H1N1) 2009

WHO, 25 January 2010

https://assembly.coe.int/committeedocs/2010/20100125_hearing_e.pdf

Context

WHO is pleased to take part in this hearing, and thanks the Council of Europe for taking this initiative. The H1N1 influenza pandemic has created immensely complicated challenges for countries as well as the global community. At the same time, rising to this challenge has created an unprecedented level of global cooperation and coordination among countries in confronting a fast moving threat in this increasingly linked and globalized world. There is much to learn about how the world can improve its handling of such events and a need to separate fact from rhetoric. Again, we welcome this opportunity.

I would like to place the current experience in a historical and scientific context. The World Health Organization (WHO) is a specialized agency of the United Nations with 193 Member States. The WHO implements the global health policies decided upon by these countries and provides technical support to the countries. WHO takes very seriously its role of helping all countries to protect and improve the health of their populations. The response to the H1N1 pandemic is just one example.

In 1946, when plans for establishing the WHO were being discussed, one of the first actions agreed upon was the creation of a worldwide network of laboratories to monitor influenza viruses. That network became operational two years before WHO itself began its work.

There were good reasons for this sense of priority and urgency. First, influenza viruses mutate constantly and are notoriously unpredictable. Second, influenza was known to cause both seasonal epidemics of disease, and on occasion, much larger global outbreaks of disease, known as pandemics. Influenza pandemics occur when a new influenza virus appears and spreads around the world in populations which previously have not been exposed to the virus.

History has shown that influenza pandemics can range enormously in their impact but that it is impossible to accurately predict the eventual impact at the beginning. What is seen early may be very different from what has been experienced by the end. The 1918 influenza pandemic, which killed an estimated 50 million people worldwide, started with relatively mild waves of illness and then evolved into the most severe influenza pandemic in history.

Preparedness

Over decades, WHO has worked with its Member States and partners to strengthen global defences against influenza as well as other major health threats. Such efforts include the strengthening of laboratories, epidemiological investigations, clinical care and communications, as well as the building of new capacities such as the International Health Regulations, to which I will return later. One result has been to significantly strengthen the broad global and national foundations essential for detecting, assessing, and responding to many health threats and not only influenza.

The WHO network of influenza laboratories, first conceived in 1946, now encompasses 139 national laboratories in 101 countries which collectively work together under the coordination of WHO. This network provides rapid warning and expert scientific assessment as well as the information essential for keeping influenza vaccines updated.

This system did not catch the very start of the 1957 and 1968 pandemics, but did quickly confirm, for both pandemics, that explosive outbreaks of respiratory disease in Asia were caused by novel influenza viruses. This allowed WHO, in both instances, to alert the world to prepare for the international spread of a pandemic.

In 1918, vaccines were not an option. For both the 1957 and 1968 pandemics, vaccines were produced round-the-clock but arrived too late. Worldwide, the 1957 pandemic caused more than 2 million deaths while the pandemic of 1968 caused around 1 million deaths. Although both were less severe in comparison to 1918, by any other measurement, such numbers of preventable deaths are large and unacceptable. Terms such as "severe" and "mild" are relative when it comes to pandemics.

WHO issued its first influenza pandemic preparedness plan in 1999, two years after a serious outbreak of avian H5N1 influenza in Hong Kong, SAR. This document was part of an intensified effort to help countries prepare for future pandemics and was updated in 2005 and again in 2009. These public documents, which form a historical record and provide recommendations to countries, were based upon the collective input of public health and scientific experts from around the world. The documents are built around the idea of phases, including a pandemic phase, and provide recommended actions to be taken by countries and WHO depending on the real world situation.

The 2009 version provides an example of the effort that went into these plans. The work began in 2007 and involved contributions from more than 135 public health scientists from 48 countries. An invitation to countries for additional comments on a draft document resulted in more than 600 replies. This work was completed in February of 2009 and published in April of that year.

The H1N1 Pandemic

In April 2009, WHO was informed of human infections caused by a new H1N1 virus. The report was of immediate concern because the genes contained in the virus were from animal influenza viruses, definitively establishing this virus as very different from the usual seasonal human influenza viruses. Further laboratory testing confirmed that existing antibodies to the current human H1N1 viruses did not react to the new H1N1 virus further underscoring the potential of the new virus to cause a pandemic. But the most important information was when investigations indicated that this new virus was causing community outbreaks with person to person spread. In Mexico, early outbreaks included deaths and severe respiratory illnesses requiring ventilators among previously healthy young people.

WHO took decisive actions in accordance with the International Health Regulations but did not announce the start of a pandemic until 11 June 2009 when the updated pandemic criteria were met. The new virus spread with unprecedented speed, reaching 120 countries and territories in about 8 weeks, and now has been reported from virtually all countries.

The H1N1 pandemic is not the same as seasonal influenza and differs in major respects. Large outbreaks occurred outside the usual season for influenza. The virus caused a striking and unusual pattern of severe illness and deaths in younger people, with many deaths caused by viral pneumonia, an especially aggressive form of pneumonia. This pattern is not typically seen during seasonal influenza.

The pandemic is not over, but to date, more than 14,000 laboratory confirmed deaths have been reported. We often see the number of deaths compared with figures from seasonal influenza. The is comparing apples with oranges. Deaths from seasonal influenza are based on statistical models. Deaths from the pandemic have been confirmed one by one through laboratory tests and unquestionably are much lower than the true number. It usually takes about 1 to two years after the end of a pandemic to get more realistic estimates of deaths using statistical modelling.

International Health Regulations and its Emergency Committee

I now want to focus on the International Health Regulations or IHR as they are often called, and the Emergency Committee. Revised in 2005, the IHR provide the world with an orderly, rules-based framework for detecting, assessing, reporting, declaring and responding to public health emergencies of international concern. They also provide the world with a system of checks and balances to ensure that no one, including the WHO Director-General, has unfettered power when making decisions.

When a possible public health emergency of international concern occurs, the IHR calls for the establishment of an Emergency Committee to advise the WHO Director-General. The Committee's membership is drawn from a larger roster, also established under the IHR, of people who are selected from around the world on the basis of their individual technical expertise.

The Emergency Committee met multiple times to advise the WHO Director-General on phase changes as well as temporary recommendations. When the Emergency Committee met to discuss a possible move to a declaration of a pandemic, the Emergency Committee meeting additionally included members who represented Australia, Canada, Chile, Japan, Mexico, Spain, UK, and the USA, eight countries that experienced widespread outbreaks at the time. These national representatives were present to ensure full consideration of the views and possible reservations of the countries expected to bear the initial brunt of economic and social repercussions.

On 11 June 2009, the Committee and all national representatives advised the Director-General that all criteria required for declaring an influenza pandemic had been met. The decision was unanimous.

Pharmaceutical Industry

Recently, accusations have been made that policies and recommendations of WHO were influenced by the pharmaceutical industry. Providing independent advice to Member States is a very important function of the WHO that is taken seriously. WHO guards against the influence of any improper interests. Let me state clearly for the record. The influenza pandemic policies and responses recommended and taken by WHO were not improperly influenced by the pharmaceutical industry.

WHO recognizes that global cooperation with a range of partners, including the private sector, is essential for optimally addressing the public health challenges of today and tomorrow. Numerous safeguards are in place to manage conflicts of interest or perceived conflicts of interest among members of WHO advisory groups and expert committees. Expert advisers provide a signed declaration of interests to WHO detailing any professional or financial matters that could affect the impartiality of their advice. WHO takes allegations of conflicts of interest seriously and is confident of the integrity and scientific validity of its decision-making during this influenza pandemic. An explanation of how WHO uses advisory bodies in responding to the influenza pandemic was made publicly available on the WHO web site on 3 December 2009.

Closing

In closing, I would like to reiterate the most basic point. This current influenza pandemic is a scientifically well-documented event in which the emergence and spread of a new influenza virus has caused an unusual epidemiological pattern of disease throughout the world. This is not an arbitrary matter of word-smithing, definitions or polemics. The labelling of the pandemic as "fake" is to ignore recent history and science and to trivialize the deaths of over 14,000 people and the many additional serious illnesses experienced by others. As we go forward, the world will continue to face many difficult health challenges. The resources to face them are limited, especially among developing countries, and finding ways to do this better is the shared responsibility of Member States and organizations, such as the Parliamentary Assembly of the Council of Europe, as well as WHO.

Thank you

[Michèle Rivasi]

Grippe H1N1: Michèle Rivasi demande une Commission d'enquête parlementaire sur la gestion de la crise en Europe. Communiqués de presse

Europe Ecologie, 25 janvier 2010
https://europeecologie.eu/Grippe-H1N1-Michele-Rivasi-EE

Alors que le Conseil de l'Europe organise mardi 26 janvier une audition de l'OMS et des fabricants de vaccins sur la transparence de la gestion de pandémie H1N1, Michèle Rivasi, députée européenne Europe Ecologie, interpellera demain après midi la Commission Européenne pour demander la mise en place d'une Commission d'enquête parlementaire sur la gestion par l'UE de cette pandémie.

«Je demande à faire toute la lumière sur les conflits d'intérêts possibles entre des organismes européens tels que l'Agence Européenne pour l'Evaluation des Médicaments (EMEA), le Centre Européen de Prévention et de Contrôle des Maladies (ECDC), et les laboratoires pharmaceutiques».

Pour l'eurodéputée spécialiste des questions de santé «le bilan de la gestion de la pandémie de grippe H1N1 est une gabégie financière dans chaque Etat-Membre et nous amène à nous interroger sur les velléités de certains organismes à mettre en place de telles campagnes de vaccination massive» en fustigeant notamment «les milliards d'euros dépensés pour une grippe que l'on savait bénigne depuis août 2009» et «les risques pris envers les populations par rapport aux effets indésirables.»

«Autant, en avril, le principe de précaution pouvait justifier de telle mesure, poursuit Michèle Rivasi, mais le bilan modéré de la grippe H1N1, connu dès la fin de l'été 2009, aurait du amener nos institutions à réviser leur stratégie. Cela n'a pas été le cas et cela s'est traduit, en particulier en France, par une campagne et un acharnement vaccinal non justifié.»

«La France déplore 220 décès et 3 000 effets indésirables différents alors que la Pologne, qui a refusé de mettre en place une campagne de vaccination, compte au total 120 morts et aucun effet secondaire. J'aimerais donc des explications précises sur les choix ayant conduit à la mise en place de telles opérations compte tenu du faible rapport bénéfice/risque.»

Michèle Rivasi organisera au Parlement Européen de Bruxelles mercredi 27 janvier 2010 une audition d'experts sur la pharmacovigilance intitulée «Gérer les Risques» pour discuter des propositions, en cours de débat, de la Commission Européenne visant à revoir le cadre législatif de la pharmacovigilance.

Pour information:

En juin 2009, l'Organisation mondiale de la santé a déclaré la phase 6 du niveau d'alerte pandémique pour le virus H1N1, juste après avoir modifié, un mois plus tôt, la définition de la notion de pandémie de façon à ce que la gravité de la maladie n'entre plus en ligne de compte, mais seulement son extension géographique.

La Commission Européenne a admis dès septembre 2009 que la grippe A (H1N1) ne provoquait que des «symptômes modérés» et que la plupart des patients ne souffrait que d'une affection bénigne et limitée. Malgré cela, la Commission a déterminé comme cible potentielle de la vaccination des groupes représentant de 34 % à 60,5 % de la population totale.

Selon les informations du Centre européen de prévention et de contrôle des maladies (ECDC), le nombre des décès annoncés depuis le début de la pandémie par les États membres de l'Union européenne ou de l'Association européenne de libre-échange totalise 1045 cas en 2009. Par ailleurs, la Commission estime que la grippe saisonnière cause près de 40 000 décès en année ordinaire et 220 000 en cas de grippe particulièrement sévère.

THE FLU CASE

Green Party asks for inquiry at European Parliament into swine flu pandemic management

The Flu Case, 26 January 2010

https://web.archive.org/web/20100220013050/http://www.theflucase.com/index.php?option=com_content&view=article&id=2636%3Agreen-party-wants-inquiry-at-european-parliament-into-swine-flu-scam&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Green Party MEP Michele Rivasi is to ask for a parliamentary inquiry at the European Parliament into the way the swine flu pandemic and vaccination campaign was carried out in the European Union.

"I am asking for the conflicts of interest between European entities such as the European Medicines Agency (EMEA), the European Centre for Prevention and Conbtrol of Diseases (ECDC) and the pharmaceutical companies to be illuminated," said Rivasi in a press release.

A hearing involving pharmacovigilance experts is to be held at the European Parliament in Brussels tomorrow focussing on European Commission proposals to revise the laws on pharmacovigilance.

PACE to prepare report on the handling of the Swine Flu pandemic

PACE, 26 January 2010
https://pace.coe.int/en/news/2724/pace-to-prepare-report-on-the-handling-of-the-swine-flu-pandemic

"Are decisions on pandemics taken on the best scientific evidence only?" was the question asked at a January public hearing of PACE's Committee on Social, Health and Family Affairs which looked into the handling of the H1N1 pandemic. The World Health Organisation's flu chief defended his organisation, saying its advice was not improperly influenced by the pharmaceutical industry.

The committee now intends to hold a second public hearing in Paris, with the participation of government officials who dealt with the pandemic. Rapporteur Paul Flynn (United Kingdom, SOC) is also due to visit the WHO’s headquarters in Geneva. His report should be available at the end of April, for a possible plenary debate in June.

Paul Flynn MP

No Apology from the WHO

Paul Flynn, MP, 26 January 2010
https://paulflynnmp.typepad.com/my_weblog/2010/01/no-apology-from-the-who.html

The World Health Organisation (WHO) were exposed to criticism and cross-examination today. This is grand self-admiring body that is reluctant to make itself accountable to the public and press. Answers were sought to the question, 'Did the WHO cry wolf and frighten the world unnecessarily?'

The Council of Europe represents 800 million people in 47 countries. While we MPs can question the conduct of our own domestic governments. only an international body like the COE can tackle the WHO.

This morning, a Council of Europe Committee held its first session on the swine flu pandemic 'that never was.' There was huge interest from the press who excelled in their sharp questioning in a subsequent press conference. I was very happy to be appointed the rapporteur for this subject. It will be my job to write the report that will eventually be presented to the full Council of Europe for approval.

I told Dr Keiji Fukuda, Special Adviser on Pandemic Influenza to the Director-General, (WHO) that his contribution was disappointing. Not a word of regret or apology. After all, they had frightened the world with the threat of deaths on a massive scale. *Subsequent events prove that this fear-mongering was unjustified*. The other consequences were £billions spent on unneeded vaccines and a disruption of health services worldwide.

Dr Luc Hessel, represented the European Vaccine Manufacturers who have made several fortunes out of selling Swine Flu Vaccines. *He confirmed that the Pharmas invested $4 Billion in preparations for the Swine Flu Pandemic beforehand. They had a vested interest in exaggerating the seriousness of the illness*. That investment would have been in vain if the world had not been galvanised with fear.

Dr Wolfgang Wodarg, medical expert specialising in epidemiology and former Chair of the Sub-committee on Health of the COE called for this inquiry. *He made a powerful case on the potential problems of vaccines that had not been sufficiently tested*. *He charge that the composition of the medicines was determined by the need to make money from patents rather than the well-being of patients*.

Professor Emeritus Dr. Ulrich Keil, University Professor and Director of the WHO Collaborating Centre for Epidemiology of the University of Münster fully supported the case presented by Doctor Wodarg.

The UK Government came out of the hearing with some credit. *We were one of the few countries that urged the WHO to water down their terrifying warnings of a health holocaust*. Health secretary of State Alan Johnstone made a plea to moderate the message to avoid public hysteria.

I promised that I will act as rapporteur and report on the scientific principles in examining evidence objectively. I look forward to the work. the WHO has served the world well in the past by eliminating smallpox and reducing the effects of other major diseases. I hope they learn a little humility and express some contrition. Otherwise trust is this vital force in world health will crumble.

European Parliament to Investigate WHO and "Pandemic" Scandal

Healthcare-in-Europe, 26 January 2010
https://healthcare-in-europe.com/en/news/european-parliament-to-investigate-who-pandemic-scandal.html

The Council of Europe member states will launch an inquiry in January 2010 on the influence of the pharmaceutical companies on the global swine flu campaign, focusing especially on extent of the pharma's industry's influence on WHO. The Health Committee of the EU Parliament has unanimously passed a resolution calling for the inquiry.

The step is a long-overdue move to public transparency of a "Golden Triangle" of drug corruption between WHO, the pharma industry and academic scientists that has permanently damaged the lives of millions and even caused death.

The parliament motion was introduced by Dr. Wolfgang Wodarg, former SPD Member of the German Bundestag and now chairman of the Health Committee of PACE (Parliamentary Assembly of the Council of Europe). Wodarg is a medical doctor and epidemiologist, a specialist in lung disease and environmental medicine, who considers the current "pandemic" Swine Flu campaign of the WHO to be "one of the greatest medicine scandals of the Century."[1]

The text of the resolution just passed by a sufficient number in the Council of Europe Parliament says among other things, "In order to promote their patented drugs and vaccines against flu, pharmaceutical companies influenced scientists and official agencies, responsible for public health standards to alarm governments worldwide and make them squander tight health resources for inefficient vaccine strategies and needlessly expose millions of healthy people to the risk of an unknown amount of side-effects of insufficiently tested vaccines. The "bird-flu"-campaign (2005/06) combined with the "swine-flu"-campaign seem to have caused a great deal of damage not only to some vaccinated patients and to public health-budgets, but to the credibility and accountability of important international health-agencies."[2]

The Parliamentary inquiry will look into the issue of „falsified pandemic" that was declared by WHO in June 2009 on the advice of its group of academic experts, SAGE, many of whose members have been documented to have intense financial ties to the same pharmaceutical giants such as GlaxoSmithKline, Roche, Novartis, who benefit from the production of drugs and untested H1N1 vaccines. They will investigate the influence of the pharma industry in creation of a worldwide campaign against the so-called H5N1 "Avian Flu" and H1N1 Swine Flu. The inquiry will be given "urgent" priority in the general assembly of the parliament.

In his official statement to the Committee, Wodarg criticized the influence of the pharma industry on scientists and officials of WHO, stating that it has led to the situation where "unnecessarily millions of healthy people are exposed to the risk of poorly tested vaccines," and that, for a flu strain that is "vastly less harmful" than all previous flu epidemics.

Wodarg says the role of the WHO and its the pandemic emergency declaration in June needs to be the special focus of the European Parliamentary inquiry. For the first time, the WHO criteria for a pandemic was changed in April 2009 as the first Mexico cases were reported, to make not the actual risk of a disease but the number of cases of the disease basis to declare "Pandemic." By classifying the swine flu as pandemic, nations were compelled to implement pandemic plans and also the purchase swine flu vaccines. Because WHO is not subject to any parliamentary control, Wodarg argues it is necessary for governments to insist on accountability. The inquiry will also to look at the role of the two critical agencies in Germany issuing guidelines on the pandemic, the Paul-Ehrlich and the Robert-Koch Institute.

Обман на $18 млрд?

Intefax, 26 января 2010, 18:54
https://www.interfax.ru/business/120696

Мировое сообщество было введено в заблуждение Всемирной организацией здравоохранения, преувеличившим степень угрозы "свиного гриппа" в интересах фармацевтов, подозревает ПАСЕ. Между тем, борьба со свиным гриппом уже обошлась правительствам и организациям здравоохранения в $18 млрд

Москва. 26 января. IFX.RU - Парламентская ассамблея Совета Европы (ПАСЕ) подозревает, что угроза "свиного гриппа" была сфальсифицирована медиками и не заслуживала статус эпидемии, являясь всего лишь гриппом средней степени. Между тем, фармацевтическая промышленность имела все шансы существенно обогатиться на панике, вызванной "свиным гриппом". Всемирная организация здравоохранения (ВОЗ) и представители фармацевтической промышленности отвергают все обвинения.

Такие позиции были заявлены во вторник в Страсбурге на публичных слушаниях, посвященному этому вопросу.

Докладчик по вопросу Пол Флинн (Paul Flynn, Великобритания, группа социалистов) отметил, что эти публичные слушания вызваны желанием "знать, как принимаются решения в отношении эпидемии - принимаются они самыми лучшими исследователями, на основе доказательств или же под влиянием других интересов", намекая, что шумиха вокруг "свиного гриппа" была поднята в интересах фармацевтов. "Это – основа нашего недовольства", – подчеркнул он.

Как заявил Вольфганг Водарг (Wolfgang Wodarg, Германия, группа социалистов) в своем докладе, ключевую роль в принятии решений по эпидемии сыграла именно ВОЗ. Депутат утверждает, что изменение ВОЗ определения "эпидемии", которое было сделано в мае прошлого года, позволило "трансформировать грипп средней степени в эпидемию, распространяющуюся по всему миру и позволило фармацевтической промышленности превратить эту возможность в звонкую монету посредством контрактов, которые, преимущественно, были секретными".

Депутат привел данные, что на борьбу с эпидемией было потрачено около $18 млрд по всему миру.

"Миллионы (людей) были привиты без каких-либо оснований. И еще не известно, имеет ли вакцина позитивный эффект, так как еще не была клинически протестирована. С моей точки зрения ВОЗ предприняла непонятные меры, которые не могут быть оправданы научными доказательствами. Совет Европы должен провести расследование в отношении того, как ВОЗ может проделывать такого вида опасные нонсенсы", - заявил он.

Естественно, что представители ВОЗ и фармацевтов все обвинения отвергают. Так, специальный советник генерального директора ВОЗ по вопросам эпидемии гриппа Кэйдзи Фукуда (Keiji Fukuda) апеллировал к истории с эпидемией гриппа в 1918 году, унесшей жизни 50 млн человек. По его словам, эта эпидемия также началась с волн среднего уровня. "Новый вирус

распространился с беспрецедентной скоростью, достиг 120 стран и территорий в течение 8 недель", - напомнил он, заверив, что реакция ВОЗ на этот вирус "не была под влиянием фармацевтической промышленности".

Представитель европейский производителей вакцины Люк Хессел (Luc Hessel) категорически отверг обвинения и сказал, что "промышленность сделала то, о чем ее просили".

Однако не все так просто, как кажется. Директор центра эпидемий Мюнстерского университета Ульрих Кейл (Ulrich Keil) заявил, что вирус H1N1, в просторечии именуемый "свиным гриппом", - "это не новый вирус, но такой, о котором нам известно давно". "Он был доставлен в США солдатами из Вьетнама, так называемый азиатский свиной грипп. Я прошу пересмотреть объявление эпидемии, сделанное ВОЗ. Мы являемся свидетелями гигантского неправильного размещения ресурсов для (защиты) здоровья общества. Правительства и общественное здравоохранение теряют огромные суммы денег, инвестируя в борьбу с эпидемиологическими заболеваними, которые базируются на неубедительных доказательствах", - заявил он.

Пока окончательного вывода в чью-либо пользу на слушаниях сделано не было, и, судя по всему, обсуждение будет длительным. Как сообщила председатель комитета ПАСЕ по социальным вопросам, вопросам здоровья и семьи Лилиана Маури Пасквер (Liliane Maury Pasquier, Швейцария, группа социалистов), на заседании бюро ПАСЕ в пятницу будет принято решение в отношении отчета по прошедшим слушаниям, и работа будет продолжена дальше. "В марте мы продолжим нашу работу, возможно, проведем дальнейшие слушания, наверняка, обменяемся мнениями и также будем разбирать этот вопрос в деталях. Как глава комитета я надеюсь, что у нас будет дискуссия в рамках пленарного заседания, доклад с рекомендациями для июньской сессии и, возможно на сессии в октябре", - сказала она.

Распространение "свиного гриппа" началось весной 2009 года в Мексике и США, затем вирус стремительно распространился по всему миру. В России первые случаи заболевания "свиным гриппом" были диагностированы в мае 2009 года, а настоящая паника среди россиян началась осенью, когда были зафиксированы несколько смертельных исходов этой болезни. Граждане атаковали аптеки, скупая защитные медицинские маски и противовирусные средства, в ответ аптечные сети немедленно повысили цены на эти товары. Правительство объявило о разработке вакцины от вируса H1N1, позднее началась массовая вакцинация. Кроме того, надзорные органы начали рейды по аптекам, завышающим цены. По данным Минздравсоцразвития, число подтвержденных случаев заболевания "свиным гриппом" в России превысило 4,5 тысячи человек, по состоянию на 10 ноября 2009 года от свиного гриппа умерли 19 человек. По состоянию на середину ноября 2009 года жертвами "свиного гриппа" в мире стали более 6,5 тыс. человек.

European hearing airs WHO pandemic response, critics' charges

CIDRAP, 26 January 2010

https://www.cidrap.umn.edu/avian-influenza-bird-flu/european-hearing-airs-who-pandemic-response-critics-charges

Jan 26, 2010 (CIDRAP News) – Officials from the World Health Organization (WHO) and a vaccine-maker trade group at a public hearing today defended themselves against allegations from some European politicians that they exaggerated the H1N1 pandemic threat to benefit drug companies.

The hearing was conducted by the Council of Europe's Committee on Social, Health and Family Affairs on the second day of the group's parliamentary assembly. Yesterday the council rejected a request that the committee's former leader made to schedule a debate on the theme "False pandemics: a threat to health." Dr Wolfgang Wodarg, a German physician and epidemiologist, is no longer a council member, because he lost his race in Germany's September federal election. However, he has been serving as an advisor.

The theme of today's hearing was transparency issues that arise in a pandemic setting. The Council of Europe, a separate entity from the European Union, is known for working on broad issues such as civil rights, economics, and democracy. The group was established after World War II and is made up of elected officials from 47 nations.

Group airs vaccine industry suspicions

At today's hearing, several committee members pressed the WHO and vaccine company officials on two main issues. They expressed deep suspicions that vaccine industry experts on WHO advisory groups improperly influenced the WHO's assessment of the pandemic in order to financially benefit pharmaceutical companies. Council members also questioned the WHO official, Dr Keiji Fukuda, special advisor on pandemic influenza to the WHO director-general, about confusion surrounding consideration of severity in its definition of a pandemic, which was revised at about the time the novel H1N1 virus was identified.

Some government public health officials and influenza experts have strongly rejected Wodarg's claims, defending vaccine stockpiling as a prudent public health response and calling the charges "preposterous."

In his opening statement, Wodarg said he was skeptical about the threat of the H5N1 virus and the contracts that countries had in place with vaccine makers in the event of a pandemic. "WHO had the trigger," he said, alluding to the pandemic plans of some countries that activate the contracts when the WHO declares the highest alert level. He speculated that vaccine makers are making a financial windfall from what he claims are more expensive patented and adjuvanted vaccines. He also argued that the billions that governments have spent on pandemic vaccines could be better spent on other health issues.

He charged that the change in pandemic definition "made it possible to turn a run-of-the-mill flu into a pandemic and translate into millions for vaccine for no good reason."

Wodarg also claimed that adjuvanted vaccines used in Europe were not adequately tested, especially in children, and expressed doubts about the safety of cell-based pandemic vaccines.

WHO, vaccine officials defend their actions

Fukuda countered that the response to a novel influenza virus quickly sweeping the globe required unprecedented global cooperation from a broad range of groups, including pharmaceutical companies.

He said it's impossible to predict how severe a pandemic will be in the initial months, pointing out that the 1918 pandemic started with mild waves of illnesses, then turned deadly. He added that the WHO updated its pandemic planning documents in 1999, 2005, and 2009 based on the input of experts from around the world. He said the agency finished its most recent revision in February 2009 and published it last April, along with the latest pandemic definitions.

The International Health Regulations (IHR), revised in 2005, provide an orderly framework for assessing and declaring a pandemic, Fukuda said. "We have checks and balances. No one has unfettered power in making decisions," he added. An emergency committee set up under the IHR was made up of technical experts and reflected the views of countries most affected early in the outbreak. "The decision was unanimous that the pandemic criteria have been met," Fukuda said.

"Let me state clearly for the record, there was no improper influence by the pharmaceutical industry," he said.

Defending the vaccine industry, Dr Luc Hessel, chairman of the European Vaccine Manufacturers Public Health Policy and Advocacy working group, rejected the accusations of Wodarg and his colleagues and said companies did what countries asked them to do: deliver a safe and effective vaccine in a timely manner. He said governments and companies needed to make decisions early, using the best information they had at the time.

Many governments had vaccine contracts in place ahead of time to avoid complex negotiations during a pandemic setting and to ease a rapid response.

Hessel said vaccine companies have taken financial risks to expand capacity and have donated pandemic vaccine to developing countries, along with providing special pricing and reserved production capacity. "We've been a reliable and responsible partner," he said.

Calls for more transparency

But Dr Ulrich Keil, a chronic disease expert who formerly worked at the WHO Collaborating Center for Epidemiology and Prevention of Cardiovascular and Other Chronic Disease at Germany's University of Munster, who sat on today's panel, said he believes the WHO and government have misdirected public health expenditures toward threats that never panned out, such as SARS, H5N1 avian influenza, and the current H1N1 flu. He claimed the money would be better spent on health problems such as cardiovascular disease, smoking, and obesity.

During the question time from committee members, many of the officials echoed Wodarg and Keil's claims and views, while a few defended the WHO's actions and said Wodarg should back up his accusations with proof.

Fukuda responded that trust and transparency are crucial during a pandemic response and assured the group that the WHO would do all it can to improve on those goals. He spelled out some of the steps the WHO uses to assess conflict-of-interest issues that might crop up with its vaccine advisory group and said their discussions are witnessed by a wide range of outside observers, such as those from nongovernmental organizations.

He stressed that the pandemic virus remains a real threat and pointed to a recent report from the US Centers for Disease Control and Prevention (CDC) that the number of children who die from the new virus is three times higher than for seasonal flu.

Though the WHO's response might not be perfect, the early response to the threat was warranted, he said. "If a patient has chest pain, you don't wait until the chest pain is severe to do something," he said. "You take steps to prevent future harm from the disease, the same as with global issues."

Committee Chairwoman Liliane Maury Pasquier, a Swiss politician who moderated the hearing, said she believed more transparency about pandemic and vaccine issues is needed. She said the parliamentary assembly's bureau will meet on Jan 29, the last day of the meeting, to discuss again the request for a debate on the issues that Wodarg and his colleagues raised. Work on the issue could continue over the Council of Europe's next two parliamentary assemblies in June and October, after which the findings might be compiled in a final report, she added.

At a press conference that followed the hearing, journalists raised some of the same questions that committee members asked the presenters, and some pressed Wodarg to provide proof of his allegations against the WHO and vaccine companies.

Communications experts explore roots of dissent

Pandemic communications experts Jody Lanard, MD, and Peter Sandman followed today's hearing events, having served on an informal communications committee that reviewed the WHO's 2005 pandemic plan revision. Lanard has also worked as a communications consultant with the WHO's Western Pacific and Pan American regional offices. Sandman is a risk-communication expert based in Princeton, N.J

Lanard said she and Sandman are puzzled by accusations that the WHO acts to benefit vaccine makers, because in the past – for example at a November 2004 meeting with industry leaders – it has signaled that it expected companies to function like charities or governments and has squirmed when they acted like companies.

"That's why I find suspicion about WHO being in cahoots with Big Pharma to be so ironic," she said. At today's hearing one of the Council of Europe committee members said all vaccines for public health should be financed on a nonprofit basis by companies, with governments footing the bill, Lanard said. "This is a coherent socialist viewpoint with which I disagree. But I think many people at WHO would be very happy if that came to pass."

"Amazingly, WHO finds itself simultaneously accused by socialists as being in bed with industry and stoking fear about a fake pandemic, and accused by libertarians as being in bed with the People's Republic of China and covering up a severe pandemic," she said. "This is an unusually extreme result of the failure respond to outrage that has been brewing for a long time."

The claim from some of the council's committee members that the WHO took severity out of the pandemic "definition" late in the game–it appears as if the change was made at the end of April or beginning of May–is a "stand-in" for their anger at the WHO for not acting to acknowledge that the pandemic has been mild overall, so far, Lanard said.

In late May and early June, before the WHO raised the pandemic alert to its highest level, its officials downplayed using severity as a criteria, because it can relate to the vulnerability and resilience of countries, which vary from nation to nation. The WHO said it hoped to take up the severity assessment issue at a later date and that such guidance would be a useful tool for countries. At the time, it leaned toward describing the flu strain as moderate, because it was causing serious disease in those with underlying conditions, pregnant women, and even some previously healthy people.

Sandman told CIDRAP News that critics at today's hearing seemed unable to distinguish between what they called a "fake pandemic" and one that has so far turned out less severe than it might have been.

However, he said the WHO may have set itself up for unfair criticism by making the same mistake the Intergovernmental Panel on Climate Change made, which led to successful attacks on its credibility: failing to acknowledge the small piece of the truth their critics are getting right.

The critics' strongest arguments are: first, that the WHO should have more quickly admitted that the pandemic was milder than initial evidence suggested; and second, that the WHO routinely included severity among factors to be considered before raising pandemic phases, until its most recent pandemic guidance revision, published in April 2009, Sandman said.

"By failing to concede these two points, WHO gives unjustified credibility to the critics' other, much less valid claims," he said. "Good guys have a harder time than bad guys understanding the need to concede the validity of valid criticisms, even when they're packaged with invalid ones."

WHO denies drugs firms swayed its flu decisions

Reuters, 26 January 2010
https://web.archive.org/web/20100128084828/http://www.reuters.com/article/idUSLDE60P0PA20100126

Strasbourg, France, January 26 (Reuters) – The World Health Organisation (WHO) denied on Tuesday that it was unduly influenced by drugs companies to exaggerate the dangers of the H1N1 flu virus.

Pharmaceutical firms picked up multi-million dollar vaccination contracts when the United Nations health agency declared the flu a pandemic last June.

Although many millions around the world have been infected with H1N1, and many thousands have died, the pandemic proved milder than health experts had originally feared.

Accusations from some politicians and media that the WHO relied too much on advice from experts in the pay of the pharmaceutical industry -- who could have a vested interest in dramatising the crisis – have triggered an internal review by the WHO and an inquiry by the Council of Europe, a European Union human rights watchdog.

The WHO's top flu expert, Keiji Fukuda, told a hearing at the Council of Europe that although the organisation's response to the virus was not perfect, it had not been bounced into the wrong decisions by the drugs giants.

"Let me state clearly for the record. The influenza pandemic policies and responses recommended and taken by WHO were not improperly influenced by the pharmaceutical industry," Fukuda told the Strasbourg-based body.

The Council, which groups together most European countries, called on the WHO to address concerns over the handling of the pandemic.

Many countries ordered tens of millions of doses of vaccines against H1N1 in a bid to protect their populations against H1N1 and are now trying to cut the orders or sell off surpluses of unused stock.

GlaxoSmithKline (GSK.L), Novartis (NOVN.VX) and Sanofi-Aventis (SASY.PA) are among H1N1 vaccine producers.

Safeguards in Place

Fukuda said the WHO consulted a range of experts, including scientists working in the private sector, when drawing up its health advice and had safeguards in place to protect against conflicts of interest.

"We are under no illusions that this response was the perfect response," Fukuda told the hearing.

"But we do not wait until (these global virus outbreaks) have developed and we see that lots of people are dying. What we try and do is take preventive actions. If we are successful no one will die, no one will notice anything," he added.

"We feel we should move quickly. Our purpose is to try to provide guidance, to try to reduce harm," he said.

Accusations began circulating in British and French media in November that the H1N1 pandemic may have been "hyped" by health experts and medical researchers keen to boost study grants and line the pockets of drug companies.

At that time, France's Le Parisien newspaper ran a headline saying: "Swine flu: why the French distrust the vaccine" and noted a gap between the predicted impact of H1N1 and the less dramatic reality, while Britain's independent newspaper asked "Pandemic? What Pandemic?".

The WHO said earlier this month that it would review the way it dealt with the flu outbreak, calling in independent outsiders to look at its workings.

Fukuda said the review would include scrutinising the way it classified virus outbreaks following widespread confusion over what the definition of "pandemic" actually meant.

"We will consider whether we can define things better, whether we can measure and report severity better," he said.

NEWS BBC

WHO defends its swine flu warning

BBC News, 26 January 2010, 15:57 GMT
http://news.bbc.co.uk/2/hi/europe/8481211.stm

The World Health Organization (WHO) has defended its handling of the swine flu pandemic last year, after the Council of Europe cast doubt on its actions.

Countries rushed to order thousands of vaccine doses when the pandemic was declared in June, but the virus proved to be relatively mild.

The WHO's links to drug companies were questioned at a hearing by the Council of Europe's health committee.

A WHO flu expert denied there had been improper influence from drug firms.

The WHO's Keiji Fukuda told a hearing in Strasbourg: "Let me state clearly for the record - the influenza pandemic policies and responses recommended and taken by WHO were not improperly influenced by the pharmaceutical industry."

When a pandemic was declared last June most European countries changed their health priorities to accommodate thousands of expected patients, including spending millions of euros on vaccines for H1N1.

A number of European governments signed contracts with drug companies to buy vaccines.

But it has since become clear that although 14,000 people worldwide died from swine flu, and millions more were infected, it is a mild flu with a lower mortality than seasonal influenza.

Allegations from politicians and media about links with drug companies have prompted an internal review at the WHO and the Council of Europe hearings.

Dr Fukuda rejected comparisons between seasonal flu and swine flu - describing them as like comparing oranges to apples.

Seasonal flu figures were based on statistical models, whereas every swine flu death had been confirmed in a laboratory, he said.

He said the WHO response had not been perfect, but a range of experts - including some in the private sector - had been consulted and there had been safeguards to prevent a conflict of interest.

"We are under no illusions that this response was the perfect response," Dr Fukuda said.

"But we do not wait until [these global virus outbreaks] have developed and we see that lots of people are dying. What we try and do is take preventive actions. If we are successful no-one will die, no-one will notice anything," he added.

"We feel we should move quickly. Our purpose is to try to provide guidance, to try to reduce harm," he said.

Part of the WHO review would examine if there was a better way to define outbreaks and severity, Dr Fukuda said.

THE FLU CASE

WHO's Fukuda Grilled at Council of Europe Hearing: Start of Substantial Investigation into the Swine Flu Scam

The Flu Case, 26 January 2010, 09:53

https://web.archive.org/web/20100220012931/http://www.theflucase.com/index.php?option=com_content&view=article&id=2631%3Awhos-fukuda-grilled-at-council-of-europe-hearing-start-of-substantial-investigation-into-the-swine-flu-scam&catid=41%3Ahighlighted-news&Itemid=105&lang=en

WHO's pandemic chief Dr Keiji Fukuda and pharmaceutical industry chief Dr Luc Hessel faced tough questions on WHO's controversial decision to declare a pandemic emergency over the mild swine flu during a 2-hour public hearing at the Council of Europe in Strasbourg this morning in a heated session that ran over time.

The hearing chair, Swiss politician Liliane Maury Pasquier, said the hearing would be the start of a more substantial investigation into the false pandemic, starting with the preparation of a report by Labour MP Paul Flynn, and with more hearings on the pandemic scare to be scheduled in the next parliamentary sessions of the Council of Europe.

During the hearing, Fukuda and Hessel faced a grilling from politicians on the influence of pharmaceutical companies on WHO's decision to declare a pandemic over the mild swine flu as well as on the dangers of the inadequately tested swine flu vaccine.

"Having cried wolf on a number of occasions now, the WHO has destroyed its credibility. Rational, independent scientific advice. There was an imperative behind this which was a financial one. The industry having invested 4 billion dollars had a vested interest in fear, in getting people to buy the vaccine," said Paul Flynn.

Professor Dr Ulrich Keil, Director of the WHO Collaborating Centre for Epidemiology at the University of Munster, said that WHO's predictions were wrong "all the time".

He criticized WHO for not learning from its past mistakes over the SARS and Avian 'Flu scares.

He said WHO had "completely exaggerated' the threat of the swine flu.

"In Germany, about 10,000 deaths are attributed to seasonal 'flu, especially among older and frail people. Only a very small number of deaths, namely 187, can be attributed to the H1N1 virus in Germany – and many of those are dubious," he said.

"We are witnesssing a gigantic misallocation of resources in terms of public health. Governments and public health services are wasting huge amounts of money in investing in pandemic diseases whose evidence base is weak."

Fukuda came under especially fierce criticism for attempting to lamely defend the WHO's decision to change the definition of a pandemic.

"The worst thing is that WHO is not evaluating what it has done. The worst thing is that the alarm will go on for two more years, that the pandemic will continue . That frightens me," said Ulrich Keil.

"A number of scientists and others are questioning the decision of the WHO to declare an international pandemic. The H1N1 virus is not a new virus, but has been known to us for decades," he said.

Dr Wolfgang Wodarg, who initiated the hearing, said that WHO was scare mongering and produced numbers about the number of victims of the pandemic based on estimates that had no basis in scientific fact.

He said that the only explanation for WHO's decision to declare a swine flu pandemic was the influence of the pharmaceutical industry if "they are not crazy", thereby brushing aside Fukuda's repeated claim that WHO had adequate safeguards against conflicts of interests and had only declared a pandemic because the swine flu was a dangerous disease.

Wodarg said that the influence of pharmaceutical companies on WHO stemmed from public private partnerships that were initiated in 1998.

He said that an investigation needed to be extended to look at the role of national regulators in the pandemic scare, and emphasized the need for parliamentary investigations in the various countries.

Wodarg also touched on the dangers of the new vaccines, specifically the use of adjuvants such as squalene, noting that there is only limited data on the impact of adjuvants on elderly people and none on their impact in young children even though children have completely different immune systems and adjuvants can cause autoimmune diseases.

He said WHO was "irresponsible" for young people and pregnant women when no data for the vaccine's safety.

WHO was also heavily criticized by a Swiss journalist for "aloofness and silence".

A journalist said WHO was "the worst in terms of relations with the media."

"They are constantly derelict. We run after them constantly to get information. We do not have access to the information. Last Friday, Gregory Hartl (WHO spokesperson) lied to us about this whole thing. He declared WHO had never changed the pandemic definition," the journalist said.

Fukuda said that "communications was the single greatest challenge", but said WHO was taking the criticism from the media.

Dr Margaret Chan had dismissed rumour, misinformation and disinformation of the scandal mongering media during the executive board session on January 18th.

Fukuda looked beaten at times as the questions flew in his direction at but always managed to recover and repeat ad nauseum theofficial line in a confident manner.

However, judging from the strength of criticism made against WHO in this hearing, the momentum for a thorough investigation into the swine flu scam looks unstoppable in spite of the fact that an urgent debate was not held this week by the Council of Europe Parliamentary Assembly.

Especially tough criticism of WHO came from Wodarg and Keil who hammered home the points that punctured Fukuda's and Hessel's air of confidence.

But politicians and journalists also fiercely criticised the WHO pandemic chief and the head of the european vaccine maufacturers for apparently making a good business profit over the pandemic scare at the expense of public health.

THE FLU CASE

Council of Europe report into the fake pandemic could be ready by spring or summer

The Flu Case, 26 January 2010, 12:53

https://web.archive.org/web/20100220012936/http://www.theflucase.com/index.php?option=com_content&view=article&id=2632%3Acouncil-of-europe-report-into-the-fake-pandemic-could-be-ready-by-spring-or-summer&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The issue of whether WHO exaggerated the threat of the swine flu in order to allow pharmaceutical industry to make huge profits is set to be the focus of a report by the Council of Europe (CoE) that could lead to parliamentary inquiries being opened in a number of European countries.

Paul Flynn, Labour MP and a member of the CoE's Public Administration Committee, is to be appointed rapporteur, tasked with preparing a report on the fake pandemic to be presented to the parliamentary assembly of the European Union's human right's watchdog during the spring or summer session.

The Assembly Bureau has to still give its formal approval to the report when it meets on Friday. But the Bureau will find it hard to turn down the request for a further investigation into the fake pandemic in view of the indignation that the public hearing in the CoE generated this morning among MPs and journalists.

WHO's pandemic chief Dr Keiji Fukuda faced severe criticism over the organization's failure to address the evidence that it had declared a pandemic to serve the interests of pharmaceutical companies.

Fukuda's statement that WHO was determined to maintain the pandemic level 6 emergency for the next two years over the mild swine flu was met with incomprehension.

WHO was accused of failing to learn from its mistakes.

The precise recommendation or resolution that MPs in the Council of Europe will be asked to vote on will crystallize at the end stage of the report's preparation, a press officer said.

However, any draft recommendation or resolution is likely to highlight the need for sweeping new measures to ensure transparency in the government public health decision-making process, and that measures are implemented on the basis of adequate independent, critical and scientific evidence – and not for the profit of pharmaceutical industries.

Other key issues that need to be highlighted are WHO's decision to recommend a vaccine with the untested and toxic adjuvant, squalene, as well as the militarization of the management of a pandemic under WHO's International Health Regulations 2005.

These allow forced vaccination and quarantine. The IHR 2005, implemented in national pandemic plans, also criminalize people suspected of having an infectious disease.

A report into the European government's collusion with the CIA in the abduction and torture of terrorism suspects was published by Dicky Marty of the Council of Europe in 2006, and triggered widespread public debate and led to changes in legislation in many European countries.

The next key date to watch for is Friday when the Assembly Bureau will meet to discuss the request for a report.

If the report goes ahead, it could result in revelations that will shock the European public and lead to pressure for radical overhaul of the way national and international governments function.

THE FLU CASE

AP, Bloomberg omit news of pandemic hearing at Council of Europe

The Flu Case, 27 January 2010, 09:02
https://web.archive.org/web/20100220013055/http://www.theflucase.com/index.php?option=com_content&view=article&id=2637%3Aap-bloomberg-omit-news-of-pandemic-hearing-at-council-of-europe&catid=41%3Ahighlighted-news&Itemid=105&lang=en

AP and Bloomberg, wires services feeding news stories into global media outlets, have not reported on the hearing at the Council of Europe yesterday where evidence was presented to prove that WHO exaggerated the danger of a pandemic in yet another example of how the mainstream media uses purposeful omission to manipulate the flow of information reaching the general public on the swine flu pandemic and ist origins.

Associated Press (AP) has 20 full-time staff working for in Bern and Zurich alone churning out 60 reports in German, 20 French and more reports in English every day, according to its website.
https://web.archive.org/web/20091001195246/http://www.ap-online.de/Dienste/Textdienst/Textdienst.htm

And yet there was not a single report coming from AP's offices in France or Switzerland on a key hearing even though it will have significant implications for the earnings of the pharmaceutical industry at the very least.

The news wires Reuters issued a report that could have been written by a WHO press officer titled: "WHO denies drugs firms swayed its flu decisions." – see above.
https://web.archive.org/web/20100128084828/http://www.reuters.com/article/idUSLDE60P0PA20100126

WHO could not have managed to get away with making a pandemic declaration over the mild swine flu if the media, including Associated Press, Bloomberg and Reuters, had not kept *repeating WHO's false statements*.

State-run media, including France's TNF 1 and Austria's ORF, also *repeated the verifiable falsehood that there was a pandemic*. Indeed, people working in the ORF said they were bombarded with emails from higher-ups insisting they report on the dangers of the swine flu virus.

Anyone who has worked for the mainstream media soon realises that, with a few exceptions, it has become a gigantic propaganda machine so detached from reality that presenting facts let alone critical analysis are reasons to be fired because they a few accurate reports can bring down the house of cards.

This is a media-generated pandemic. The aim of the media has been to terrorise people into taking the swine flu vaccine, which has been portrayed as safe and tested, when it is no such thing.

Sherri Kane has explored some of the links between Thomas Glocer's Reuters News Service and Rupert Murdoch's News Corporation, to which AP belongs, and big pharma.

Not only WHO and the pharmaceutical should be in the dock but the controllers of the mainstream media for their role in perpetrating the swine flu scam.

"It turns out that *Murdoch,* directing most powerfully the influential media, including Fox News, the Associated Press (AP), Twentieth Century Fox, Time Warner, and much more, controls the Murdoch Childrens' Research Institute (MCRI) in Australia, responsible for the first H1N1 Swine flu tests on children 6 months to 8 years of age

Murdoch's son, and heir apparent, James, the Chairman and Chief Executive of News Corporation for Europe and Asia, is an overseer of GlaxoSmithKline's Board of Directors. They are one of six companies that make H1N1 vaccines.

Rupert's mother, Elisabeth Murdoch, is the grand matriarch of the Royal Victoria Women's Hospital in Melbourne. Its staff collaborated with CSL Pharmaceuticals, another H1N1 vaccine maker. CSL is owned by Merck & Co. They used flawed testing methods on pregnant women, doctors say. Their safety tests lacked legitimate placebo controls and evaded long-term surveillance and data collection. The missing data prevented credible scientific analysis. Thus, BigPharma had nothing to substantiate their liberally-issued safety assurances. In other words, PharmaMedia conducted an obvious case of scientific fraud and public deception for vaccine market proliferation.

Thomas Glocer, the CEO of Reuters, is also on the Board of Directors of Merck & Co., and a partner with Rupert Murdoch in the Partnership for New York City that personifies the heart of this drug ring. The partners profitably advance biotechnology and "genetopharmaceuticals" globally, more than any other consortium.

This *PFNYC was founded* by David Rockefeller who controls the CFR and World Health Organization (WHO). Rockefeller-approved Co-Chairs of the PFNYC include Rupert Murdoch and Lloyd Blankfein, the chief of Goldman Sachs who financed the merger of MedImmune and Astrozeneca, producers of FLUMIST--the nasal spray H1N1 vaccine. Blankfein holds millions, perhaps billions, of dollars of the company's stock.

Dagbladet

Calls for Investigation into Swine Flu scam grow in Norway

Dagbladet (Norway) // The Flu Case, 26/27 January 2010
https://web.archive.org/web/20100220013111/http://www.theflucase.com/index.php?option=com_content&view=article&id=2640%3Acalls-for-investigation-into-swine-flu-scam-grow-in-norway&catid=1%3Alatest-news&Itemid=64&lang=en

The Christian Democratic Party (DDP) has said the government's handling of the swine flu immediately must be reviewed by independent investigators.

Whether the influenza danger was "overhyped"and exaggerated, is being discussed in many countries. The debate should be held in Norway, too, believes DDP health spokeswoman Laila Daavoey.

"We need to go wide, but primarily through the national and local management of swine flu. We are also going to have to look at the flow of information between authorities, the municipal health service and GPs. A lot of people believe it was worse than it should have been, "said Daavoey to NTB.

The Christian Democratic Party representative said over half the population has been vaccinated and several billions were spent on the "pandemic"

"I am critical of the Norwegian government should evaluate this themselves. I had hoped for an independent assessment, " said Daavoey.

MailOnline

Drug firms 'drove swine flu pandemic warning to recoup £ billions spent on research'

Daily Mail, 27 January 2010, 07:49 BST,
http://www.dailymail.co.uk/news/article-1246370/Drug-firms-drove-swine-flu-pandemic-warning-recoup-billions-spent-research.html

Drug companies manipulated the World Health Organisation into downgrading its definition of a pandemic so they could cash in on a swine flu outbreak, it is claimed.

An inquiry heard yesterday that the WHO allegedly softened its criteria for declaring a H1N1 flu pandemic last spring - just weeks before announcing there was a worldwide outbreak.

Critics said the decision was driven by pharmaceutical companies desperate to recoup the billions of pounds they had invested in researching and developing pandemic vaccines after the bird flu scares in 2006 and 2007.

As a result, millions of people have been vaccinated against a mild illness, and money that could have been used to prevent and treat major killers such as heart disease has been squandered.

The claims, which emerged during the first of several Council of Europe hearings into the handling of the swine flu pandemic, were strongly rejected by the WHO.

Following the organisation's declaration of a pandemic, the Department of Health warned of 65,000 deaths, set up a special advice line and website, and suspended normal rules so anti-flu drugs could be given without prescription.

But with just 250 or so deaths in Britain and 14,000 worldwide, the WHO is being asked to account for its actions.

The Government is now trying to off-load millions of jabs it ordered at the height of the scare. Sources say it is even considering giving some doses away for free.

Wolfgang Wodarg, former head of health at the Council of Europe, the Strasbourg-based 'senate' responsible for the European Court of Human Rights, said vaccine contracts were put in place in 2007, when it was feared the more lethal bird flu virus would mutate into human form.

Drug companies, which spent up to £2.5billion developing a vaccine, then pushed their interests within the WHO, leading to the definition of a pandemic being softened and an outbreak declared.

He told the hearing: 'It was stated in panic- stricken terms that this was a flu that could threaten humanity and a great number of humans could fall ill.

'This is why billions of dollars of medications were bought.

Dr Wodarg, an expert on the spread of disease, said that the change in definition made it possible for a worldwide pandemic to be declared and for the pharmaceutical companies to cash in.

Also giving evidence, Professor Ulrich Keil, a WHO adviser on heart disease, said the decision had led to a 'gigantic misallocation' of health budgets.

'We know the great killers are hypertension, smoking, high cholesterol, high body mass index, physical inactivity and low fruit and vegetable intake,' he said.

'In spite of all these facts, governments instead wasted huge amounts of money by investing in pandemic scenarios whose evidence base is weak.'

But Dr Kieji Fukuda, the WHO's top flu expert, rejected the allegations. 'We do not wait until (these global virus outbreaks) have developed and we see that lots of people are dying,' he said.

'What we try to do is take preventive actions. Our purpose is to try to provide guidance, to reduce harm.'

Swine Flu Didn't Fly

TruthOut, 28 January 2010
https://truthout.org/articles/swine-flu-didnt-fly/

For makers of the swine flu vaccine, 2009 was a year to remember. By June, CSL Limited's profits rose 63 percent above 2008 levels, while in the third quarter of 2009 - just about the time H1N1 contracts picked up steam - GlaxoSmithKine enjoyed a 30 percent jump in earnings to $2.19 billion. Roche, the maker of Tamiflu, which prevents H1N1, saw second quarter profits leap to 12 times what they were in that quarter of 2008. But in 2010, drug companies may get their comeuppance.

On Tuesday, the Council of Europe launched an investigation into whether the World Health Organization (WHO) "faked" the swine flu pandemic to boost profits for vaccine manufacturers. The inquiry, held in Strasbourg, France, vindicates a worldwide movement of insiders, experts and elected officials who accuse the United Nations organization of misleading the world into buying millions of unnecessary vaccines.

"I have never heard such a worldwide echo to a health political action," said Dr. Wolfgang Wodarg, an epidemiologist who formerly led the health committee for the Council of Europe, at Tuesday's hearing.

Also present was Dr. Ulrich Keil, director of the WHO's Collaborating Centre for Epidemiology. Keil hammered his own organization and WHO flu chief, Dr. Keiji Fukuda, for "producing angst campaigns."

"With SARS, with avian flu, always the predictions are wrong ... Why don't we learn from history?" Keil asked. "It [swine flu] produced a lot of turmoil in the pubic and was completely exaggerated " exaggerated" in contrast with all the really important matters we have to deal with in public health."

Last year the WHO predicted that H1N1 could infect two billion and claim hundreds of thousands of lives, while President Obama's science advisers said the outbreak could infect up to 120 million Americans and kill 90,000.

But in the end, H1N1 turned out to be one of the milder flu strains on record. The type-A influenza is confirmed to have taken around 14,000 lives worldwide, according to WHO numbers from January 22. The CDC said in December confirmed US deaths had reached 4,000, although it recently estimated that due to underreporting, the true death toll could be as high as 16,500 - a tragic sum, but less than half of what the CDC attributes to seasonal flu-related illness. In most of the northern hemisphere, hog flu has been on the decline for some ten straight weeks. New transmissions are largely contained to North Africa and South Asia, according to the WHO.

Throughout 2009, the WHO and domestic health agencies around the globe ignored mounting signs that swine flu wasn't much of a killer, choosing instead to man the war bugles at full volume. The result was that governments poured tens of billions of dollars into vaccines. The US alone has spent $2 billion on the drugs and has allocated $7.5 billion in supplemental spending for H1N1 preparedness.

Now that the disease has petered out ahead of schedule, however, countries are stuck with millions of unused doses. French and German governments have had to cancel millions of orders of the vaccines due to falling demand and late-breaking news that European health authorities had recommended twice the necessary dosage. The CDC has dealt with the glut in another way. It now says all Americans should go and get the shot – a shift from its earlier recommendation that at-risk groups such as the young, sick, pregnant and nurses seek injections first. But why should everyone get a shot when that the disease appears to be over?

On January 22, the WHO issued a statement calling allegations that it irresponsibly stoked H1N1 fears, "scientifically wrong and historically incorrect." The statement defends figures the WHO publicized on transmission rates, mortality and the virulence of swine flu.

"The world is going through a real pandemic. The description of it as a fake is wrong and irresponsible. We welcome any legitimate review process that can improve our work."

Previously, the WHO had offered scant response to allegations of corruption, but deigned to defend itself after the Council of Europe meeting was announced. At the hearing, the WHO's flu director, Dr. Fukuda, denied the accusations against the WHO. "Let me state clearly for the record - the influenza pandemic policies and responses recommended and taken by WHO were not improperly influenced by the pharmaceutical industry."

The public meeting to examine accusations against WHO was set up by the Parliamentary Assembly of the Council of Europe (PACE), which represents 800 million people in 47 countries.

=> see: http://assembly.coe.int/CommitteeDocs/2010/20100119_HearingProgrammeSOC.pdf

Established by various European nations in 1949 to promote human rights and the democratic rule of law, the Council's January 26 meeting involved WHO officials, European drug makers and medical experts. PACE's findings are expected to be announced January 29 and will likely be followed by an in-depth study and recommendations to European governments.

The PACE hearing is the latest in a series of investigations into the WHO's propriety, which also includes a 2009 Danish Parliamentary inspection of links between WHO expert, Albert Osterhaus, and makers of the swine flu drugs. Russian lawmaker Igor Barinov has also started an inquiry into the WHO's ties to H1N1 drug makers.

Similar critiques have been leveled at domestic health authorities as well, which generally took their cues on how to deal with swine flu from the WHO.

In France, Health Minister Roselyne Bachelot was forced to a Paris court on January 4 over swine flu campaign irregularities - including ordering millions of unnecessary vaccine doses. Demonstrations over statistical improprieties have taken place in Scotland and Canada.

Inquiries into WHO misdoing are likely to plunge deep into the statistical methods for data collection, however, it takes no expertise to see that health agencies' data about H1N1 was wildly misleading.

For example, a study released December 7 by the Harvard School of Public Health found that the CDC predicted that H1N1 mortality rates would be 80 to 500 times higher than they turned out to be - with the WHO doing only slightly better. The CDC also overshot the likelihood that pig flu causes serious illness by seven to nine times, the study found. Another study, done by the CDC itself and published in the New England Journal of Medicine on December 31, found that swine flu was far more difficult to transmit that it had initially claimed. See: =>

[NEJM, 2009, Dec 31, 361: 2619-2627] => https://www.nejm.org/doi/full/10.1056/NEJMoa0905498

The larger question begged by health agencies' bad data and the media's dutiful reporting of it is this: if fears are overstated every time there's a flu outbreak, when the public really does need a vaccine, who will believe the boys who cried wolf?

Should the European Council's investigations conclude that the WHO deliberately incited H1N1 paranoia to help drug makers, it could spark reform of how infectious diseases are handled. The paramount questions experts will try to address are how dangerous a disease must become before a global vaccination campaign is advised, and when a disease should truly qualify as a "pandemic".

Proof of direct corruption may be difficult for the Council to establish, but the string of clues which points to this corruption - as befits the trail of a wild pig - is not hard to follow.

...

The opinion given by Dr. Wodarg at Tuesday's meeting is that the definition change was designed to boost vaccine sales. "There is no other explanation for what happened. Which reasons could lead to those [WHO] decisions? I don't find any other explanation. It's not for health. And who profits? Why else would you change the definition?"

...

Dr. Wodarg told the Council of Europe Tuesday that there has been dissent ever since the shift toward public-private partnership began in earnest in 2001.

"Already then there were very critical voices against the influence. [WHO's] administration is made of people not well paid who can't fight against the pay of people in and from the industry - they are simply swept aside ... [private] influence is rampant and that is why we can't understand why the WHO we used to love ... has become unrecognizable to us."

Pandemic Profit

All US contracts for H1N1 vaccines went to just five companies: CSL Limited, Novartis, Sanofi Pasteur, GlaxoSmithKline and MedImmune. All five also produced shots for either SARS or avian flu. When the response to swine flu took full flight in the second and third quarters of 2009, these firms' earnings skyrocketed. But according to British MP, Paul Flynn, that was part of the drug makers' plan. Prior to winning any contracts, drug makers invested $4 billion in preparations for swine flu, he said. That investment may have gone to developing and patenting new, super-fast methods to create vaccines, such as using a bioreactor to grow viruses, said Dr. Wodarg. These patents were key to drug industry profits, since companies can charge much more for patented drugs than unpatented ones, Wodarg said.

"If you have a patent you can monopolize ... and this is what industry did: Invented a fast way to produce vaccines and had it patented, which is much more expensive ... The alternative is not to have vaccines patented ... By decentralizing the production you could be as fast and you wouldn't have this small way you have to pass negotiating with one enterprise that has monopoly, or with four enterprises. It's the economic dimension of the problem which we have to have in mind as we consider how this all happened."

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

Steve Watson

WHO Scientist: Swine Flu Pandemic Was "Completely Exaggerated"

Infowars, 28 January 2010

https://web.archive.org/web/20100130202019/http://www.infowars.com/who-scientist-swine-flu-pandemic-was-completely-exaggerated/

A scientist with the World Health Organisation has testified, during ongoing hearings in Strasbourg, France, that the swine flu pandemic was part of an overblown "angst campaign", devised in conjunction with major drug companies to boost profits for vaccine manufacturers.

Professor Ulrich Keil, director of the WHO's Collaborating Centre for Epidemiology, slammed the organization and its flu chief, Dr Keiji Fukuda while giving evidence before The Parliamentary Assembly of the Council of Europe (PACE).

"With SARS, with avian flu, always the predictions are wrong…Why don't we learn from history?" Keil said. "It [swine flu] produced a lot of turmoil in the pubic and was completely exaggerated in contrast with all the really important matters we have to deal with in public health."

The WHO adviser on heart disease, added that the decision had led to a "gigantic misallocation" of health budgets.

"We know the great killers are hypertension, smoking, high cholesterol, high body mass index, physical inactivity and low fruit and vegetable intake," he said. "In spite of all these facts, governments instead wasted huge amounts of money by investing in pandemic scenarios whose evidence base is weak."

PACE, a 47-nation body encompassing democratically elected members of parliament, will determine whether a "falsified pandemic" was declared by WHO in June 2009 on the advice of medical advisors, many of whom have close financial ties to the very pharmaceutical giants – GlaxoSmithKline, Roche, Novartis, – that produced the H1N1 vaccines.

It will also look into the controversy surrounding the fact that two shots were initially advised when it was later revealed that one dose was entirely suitable, as well as investigating concerns over hastily developed vaccines containing adjuvants.

Pharmaceutical companies are thought to have made a profit of somewhere in the region of $7.5-$10 billion on H1N1 vaccines, recouping the billions they had invested in researching and developing pandemic vaccines after the bird flu scares in 2006 and 2007.

The worldwide death toll from H1N1 is thought to be around 13,500, just over a third of the number who die from regular flu every year in the U.S. alone.

Heading the hearings is the former chairman of the Health Committee of PACE, Dr. Wolfgang Wodarg. A former German lawmaker, a medical doctor and epidemiologist. Wodarg has referred to the swine flu pandemic as “one of the greatest medical scandals of the century.”

Wodarg has pointed out that the WHO softened the definition of a pandemic from an outbreak in several continents at once with an above-average death rate, to one where the spread of the disease is constant.

Just one month after changing the definition, and with just 144 people having died from H1N1, the flu was given the highest threat classification possible, a “stage-six pandemic alert”. By comparison, the mildest 20th Century pandemic killed a million people.

“I have never heard such a worldwide echo to a health political action,” Wodarg, an epidemiologist who formerly led the health committee for the Council of Europe, said at Tuesday’s hearing. “It was stated in panic-stricken terms that this was a flu that could threaten humanity and a great number of humans could fall ill. This is why billions of dollars of medications were bought.” Wodarg said.

He added that the the change in definition “made it possible for the pharmaceutical industry to transform this opportunity into cash, under contracts which were mainly secret.”

“In my view, the WHO undertook an incomprehensible action, which cannot be justified by scientific evidence. The Council of Europe should investigate this to see how WHO can undertake this kind of dangerous nonsense,” said Dr Wodarg.

WHO’s flu chief, Dr Fukuda, insisted that its swine flu scientists do not have conflicts of interest owing to close links with pharmaceutical companies.

“Let me state clearly for the record – the influenza pandemic policies and responses recommended and taken by WHO were not improperly influenced by the pharmaceutical industry.” Fukuda told the inquiry.

He said those calling the epidemic fake were wrong and irresponsible.

PACE’s findings are expected to be announced January 29 and will likely be followed by an in-depth study and recommendations to European governments.

THE FLU CASE

Council of Europe gives green light to report on influence of Big Pharma on WHO's handling of Swine Flu Pandemic

The Flu Case, 29 January 2010, 10:13

https://web.archive.org/web/20100220013213/http://www.theflucase.com/index.php?option=com_content&view=article&id=2657%3Acouncil-of-europe-gives-green-light-to-report-on-influence-of-big-pharma-on-whos-handling-of-swine-flu-pandemic&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Assembly Bureau of the Council of Europe Parliamentary Assembly (PACE) this morning confirmed the appointment of Paul Flynn, UK Labour MP, to prepare a report on the issue of whether WHO exaggerated the dangers of the swine flu in order to allow pharma companies to reap profits, a press officer said.

Paul Flynn's report will probably be presented to the Council of Europe MPs for debate in the spring or summer sessions.

MPs will vote on a recommendation or resolution to be put before all 47 European parliaments who belong to PACE.

During the PACE public hearing of WHO pandemic chief Dr Keiji Fukuda and vaccine manufacturer representative Dr Luc Hessel on Tuesday, Flynn was critical of WHO's handling of the swine flu pandemic.

"The world has been frightened by a serious of health scares – SARS, Avian ‘Flu and now Swine ‘Flu. We now know, in hindsight, that the fears that were aroused do not appear to be justified. So we want to know how decisions on pandemics are taken – are they taken on the best scientific, epidemiological evidence, or are they influenced by other interests? That is the basis of this complaint. With H1N1, did the WHO, once again, frighten the world without any substantial evidence?" he said.

The public hearing was initiated by Wolfgang Wodarg, former SPD MP in Germany.

The PACE report could be explosive if it documents the scientific body of evidence that the swine flu vaccines were not tested and also contain adjuvants, squalene, known to produce autoimmune and other diseases.

Council of Europe launches investigation into H1N1 pandemic

BMJ, 1 February 2010
doi: https://doi.org/10.1136/bmj.c641 // https://www.bmj.com/content/340/bmj.c641

A Europe wide investigation will begin this week into the World Health Organization's decision to label the outbreak of swine flu a "pandemic," amid allegations that it did so under pressure from drug companies looking to boost demand for their vaccines.

The inquiry, launched by the Council of Europe's parliamentary assembly, will be led by the British Labour MP Paul Flynn and could be concluded as early as June.

Speaking after being appointed to the role, Mr Flynn said that he wanted to establish how WHO had assessed the risks from the new virus and to identify the factors that led the organisation to classify the health threat as a pandemic.

"Was the decision taken on objective, independent medical grounds or was it influenced by the imperative of drug companies looking for a return on their investment?" he asked.

The 47 countries represented in the Council of Europe's parliamentary assembly gave the formal go-ahead to the investigation on 29 January after the Strasbourg based organisation's social, health, and family affairs committee had held a two hour public hearing on the issue three days earlier.

Wolfgang Wodarg, a former German MP and specialist in epidemiology, told the hearing that the public had been warned that millions of people would fall ill with the flu. "WHO basically held the trigger for the pandemic preparedness plans. It had a key role to play in deciding on the pandemic. Around $18bn [£11.3bn; 13bn] was spent on the pandemic worldwide," he said.

Responding to the criticism, Keiji Fukuda, a special adviser on pandemic flu to WHO's director general, insisted that the organisation stood by the scientific validity of its recommendations and denied that its independence had been compromised by outside pressure.

He said, "The flu pandemic policies and responses were not improperly influenced by the pharmaceutical industry. Cooperation with a range of partners, including the private sector, is necessary, but numerous safeguards are in place to avoid conflicts of interest."

Luc Hessel, representing European vaccine manufacturers, rejected claims that drug companies had helped fuel fears over the virus and maintained that the "industry responded quickly and effectively and was able to deliver the vaccines ordered by governments."

During his investigation Mr Flynn will question WHO about its procedures and examine how different governments reacted to the warnings. "Poland probably did the least and the United Kingdom the most, but the outcome in the two countries was not that different," he said.

He will also look to establish the extent to which the public's trust in WHO has been damaged by its handling of the H1N1 outbreak. Similarly dire warnings, which critics believe were exaggerated, were made over severe acute respiratory syndrome and avian flu.

Dr. Wolfgang Wodarg on Alex Jones:
The false swine flu pandemic and the WHO cartel

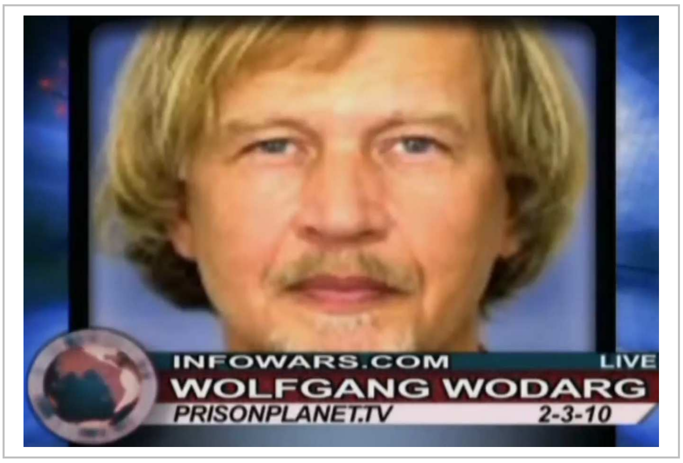
Prison Planet, 3 February 2010

https://www.youtube.com/watch?v=TDQO3n-NjnI

https://web.archive.org/web/20100413054259/http://www.infowars.com/dr-wolfgang-wodarg-on-alex-jones-tv-whos-2009-swine-flu-threat-now-exposed-as-a-hoax/

Public hearing on handling of H1N1 pandemic –

A public parliamentary hearing “The handling of the H1N1 pandemic: more transparency needed?” was held during the session on 26 January. The hearing brought together representatives of the World Health Organisation (WHO) and of European vaccine manufacturers, as well as independent medical experts, to discuss this topic with parliamentarians. The hearing was initiated by the outgoing Chair of PACEs Sub-committee on Health Wolfgang Wodarg, who together with some other members of the Assembly of the Council of Europe requested in a motion in December that the Assembly look into this question. The hearing was open to the press. Both hearing and press conference were webcast live. Here the statement presented by Dr. Wodarg:



Paul Joseph Watson

Investigation Chief: Swine Flu Pandemic Was A Hoax

Prison Planet, 4 February 2010

https://web.archive.org/web/20100207135141/http://www.prisonplanet.com/investigation-chief-swine-flu-pandemic-was-a-hoax.html

Appearing on The Alex Jones Show, outgoing Chair of the Council of Europe's Sub-committee on Health Wolfgang Wodarg said that his panel's investigation into the 2009 swine flu outbreak has found that the pandemic was a fake hoax manufactured by pharmaceutical companies in league with the WHO to make vast profits while endangering public health.

The Parliamentary Assembly of the Council of Europe, a 47 nation body encompassing democratically elected members of parliament, began hearings last month to investigate whether the H1N1 swine flu pandemic was falsified or exaggerated in an attempt to profit from vaccine sales.

Wodarg said that governments were "threatened" by special interest groups within the pharmaceutical industry as well as the WHO to buy the vaccines and inject their populations without any reasonable scientific reason for doing so, and yet in countries like Germany and France only around 6 per cent took the vaccine despite enough being available to cover 90 per cent of the population.

Wodarg said he was alarmed when the WHO cited early cases in Mexico as a threat and quickly moved to pandemic status, despite the fact that the cases were relatively mild and the virus was not new.

"This was the mildest flu ever and the people were much more clever than the government so we have to find out what was going on with WHO – why did they do this pandemic alarm," asked Wodarg, noting that pharmaceutical interests within the World Health Organization were instrumental in creating the panic and reaping the financial dividends.

"We don't know what really happened, we only know that they changed the definition of a pandemic, which was a very dangerous thing before and now is just a normal flu, and this is why business for pharmaceutical companies was open," said Wodarg, adding that select pharmaceutical companies were handed a monopoly on creating the vaccine.

"It is their trick that they always try to monopolize this and we pay much more like this," said Wodarg, noting that if patents were left open, vaccines would be produced much quicker and far cheaper.

Wodarg said there was "no other explanation" for what happened than the fact that the WHO worked in cahoots with the pharmaceutical industry to manufacture the panic in order to generate vast profits, agreeing with host Alex Jones that the entire farce was a hoax.

He also explained how health authorities were "already waiting for something to happen" before the pandemic started and then exploited the virus for their own purposes.

Wodarg said that the investigation was likely to recommend an end to the undue influence of pharmaceutical companies on public health institutions in Europe.

However, Wodarg pointed out, “There is no law for WHO, there is no one who punishes those people in WHO, we only have national law, so this is very important that we collect the information and on the national level we try to find those people responsible and we try to punish them.”

“Have investigations, have a deep look, we cannot tolerate such a development, we cannot have this next winter again, we don’t want such fake pandemics,” concluded Wodarg.

Wodarg said that vast quantities of unused vaccines were now being dumped on the third world and that other countries were simply trying to push ahead with vaccination programs even though the virus has proven not to be a major threat.

“The Japanese bought vaccines for 110 million people and they cannot return from this vaccine contract so they are in a very big political dilemma now and they already have problems because the Japanese people already know it wouldn’t be necessary to get vaccinated,” Wodarg told The Alex Jones Show.

THE FLU CASE

French and Spanish versions of False Pandemic available; please help keep the website going for the home stretch

The Flu Case, 2 March 2010, 17:35

https://web.archive.org/web/20100525030102/http://www.theflucase.com/index.php?option=com_content&view=article&id=2875%3Afrench-and-spanish-versions-of-false-pandemic-available-please-help-keep-the-website-going-for-the-home-stretch&catid=1%3Alatest-news&Itemid=64&lang=en

Sincere thanks to Carolyn Dunning and Claudia Calvo for translating the first chapter of False Pandemic into French and into Spanish.

These translations will certainly help information about the mass swine flu vaccination campaign to circulate around the world – and so increase pressure for in-depth inquiries as well as for criminal charges against those specific individuals responsible for putting so many people at risk due to a vaccination with an untested and toxic vaccine.

The French parliament has already announced a commission of inquiry into the influence of pharmaceutical companies on the swine flu vaccination scam.

Also, UK MP Paul Flynn is preparing a key report for the Council of Europe Parliamentary Assembly for a vote in July or October.

This report will eventually be sent to all the parliaments in Europe, including Switzerland and Russia, for their consideration, and could lead to parliamentary inquiries in many countries and/or changes in legislation to offer better protection to people.

Paul Flynn has already indicated in an email that he is prepared to look into the incident that nearly triggered a global bird flu pandemic last February when 72 kilos of seasonal flu vaccine was contaminated with the live bird flu virus in a Baxter facility in Austria, and sent to 16 labs in Europe.

Your donations will help keep the website going and getting the book written.

Any contribution you can make is much appreciated.

If you contribute, you can, if you so wish, have your name listed at the end of the book.

Finally, many thanks to each person who has already donated so generously.

Le Monde

Grippe A : des eurodéputés demandent une commission d'enquête

Le Monde avec AFP, 9 mars 2010 à 17h40
https://www.lemonde.fr/planete/article/2010/03/09/grippe-a-des-eurodeputes-demandent-une-commission-d-enquete_1316825_3244.html

Des députés européens dénoncent la manière dont les autorités sanitaires ont fait face à la grippe A(H1N1) et l'argent "gaspillé", selon eux, dans la campagne de vaccination.

Des députés européens ont demandé mardi 9 mars que le Parlement se dote d'une commission d'enquête sur la manière dont les autorités sanitaires ont fait face à la grippe A(H1N1) ainsi que sur l'argent *"gaspillé"*, selon eux, dans la campagne de vaccination.

Pour voir le jour, la commission d'enquête devra être approuvée d'ici deux semaines par un quart des parlementaires, soit cent quatre-vingt-trois élus. Les eurodéputés qui ont pris l'initiative de cet appel sont originaires de plusieurs pays et issus de tous les groupes politiques. Ils dénoncent les *"moyens disproportionnés"* mis en œuvre pour faire face à la pandémie, qui au final s'est avérée beaucoup moins grave que redouté initialement.

Si cette commission était créée, elle devrait notamment s'intéresser au rôle des autorités sanitaires de l'Union européenne (Centre européen de prévention et de contrôle des maladies et Agence européenne des médicaments). Elle devrait également se pencher sur les éventuels *"conflits d'intérêts"* nés du fait que certains experts consultés par les autorités travaillent aussi pour des laboratoires pharmaceutiques, a fait valoir la centriste française Corinne Lepage.

"Quelle confiance les citoyens européens pourront-ils avoir lors de prochaines pandémies si l'on ne remet pas à plat notre fonctionnement ?" a demandé l'élue écologiste française Michèle Rivasi. *"Il ne s'agit pas de condamner qui que ce soit, mais plutôt de retenir des leçons pour la prochaine fois. Car il y aura une prochaine fois, et ce pourra être beaucoup plus grave"*, a estimé la conservatrice britannique Marina Yannakoudakis.

THE FLU CASE

Call for swine flu vaccine campaign inquiry in European Parliament

The Flu Case, 10 March 2010, 14:07

https://web.archive.org/web/20100525025706/http://www.theflucase.com/index.php?option=com_content&view=article&id=2962%3Acall-for-swine-flu-vaccine-campaign-inquiry-in-european-parliament&catid=41%3Ahighlighted-news&Itemid=105&lang=en

MEPs have called for an commission of inquiry in the European Parliament on the handling of the swine flu pandemic, according to Le Monde and AFP.

Green MEP Michele Rivasi said that several EU countries had spent "enormous" amounts of money for mass vaccinations using an inadequately tested vaccine.

The European Parliament should investigate if conflicts of interests were involved in the pandemic emergency declaration over the swine flu, Rivasi told AFP.

Links between experts working for the EU and pharmaceutical industry should be examined.

The call for a commission of inquiry has so far been backed by 14 MEPs from across the political spectrum.

183 MEPs have to sign up in the next two weeks for the request to be sent to party chiefs for consideration.

A commission of inquiry has already been announced in the French parliament.

Also, UK MP Paul Flynn is preparing a report for the Council of Europe Parliamentary Assembly on whether pharmaceutical industry influenced WHO in declaring a pandemic emergency level 6.

Report in Le Monde (translated by Carolyn Dunning):

MEPs called on Tuesday, March 9 for the Parliament for the creation a commission of inquiry into how health authorities dealt with the influenza A (H1N1) flu and on the money "wasted", according to them, involved in the vaccination campaign.

For this to happen, the commission of inquiry will have to be approved within two weeks by a quarter of parliamentarians, that is to say one hundred eighty-three elected members. MEPs who initiated this call came from several countries and from all political groups. They denounced the "disproportionate means" implemented to address the pandemic, which ultimately proved less serious than initially feared.

If this commission was created, it should particularly address the role of health authorities in the EU (European Centre for Prevention and Disease Control and European Medicines Agency). It should also focus on possible "conflicts of interest" which arose from the fact that some experts consulted by the authorities also work for pharmaceutical companies, argued the French centrist, Corinne Lepage.

"How will Europeans be able to trust us during future pandemics if we do not completely revise our operations?" asked the French elected environmentalist Michele Rivasi. "This is not to condemn anyone, but rather to draw lessons for next time. For there will be a next time, and that may be much worse," said the British conservative Marina Yannakoudakis.

DIE TAGESZEITUNG junge Welt

Umgang mit «Schweinegrippe» prüfen

Junge Welt, 10 March 2010

https://www.jungewelt.de/loginFailed.php?ref=/artikel/140817.umgang-mit-schweinegrippe-pr%C3%BCfen.html

Europaparlamentarier kritisieren fraktionsübergreifend Massenimpfungen. Untersuchungsausschuß gefordert.

Straßburg – Im Europaparlament haben Abgeordnete aus allen maßgeblichen Fraktionen die Einrichtung eines Untersuchungsausschusses zum Umgang mit der sogenannten Schweinegrippe gefordert. Mehrere EU-Staaten hätten wegen der Warnung vor einer angeblichen Pandemie »enorm viel Geld« für Massenimpfungen ausgegeben, sagte die französische Grüne Michèle Rivasi. Zudem seien zahlreiche Menschen als »Versuchskaninchen« für unzureichend getestete Impfstoffe benutzt worden.

Der Untersuchungsausschuss solle ermitteln, ob "Interessenskonflikte" zu der falschen Pandemie-Warnung geführt haben, sagte Rivasi weiter Dazu sollten mögliche Verbindungen der von der EU angehörten Experten zur Pharma-Industrie durchleuchtet werden.

Die Forderung nach einem Untersuchungsausschuss wurde bislang von 14 Abgeordneten unterstützt, unter ihnen Christdemokraten, Sozialdemokraten, Liberale, Linke und Grüne. Sie wollen nun innerhalb von zwei Wochen die notwendigen 183 Unterschriften sammeln. Anschließend müssen sich die Fraktionsvorsitzenden mit dem Vorschlag befassen.

Im Europarat hatten Experten und Mitglieder der Parlamentarier-Versammlung Ende Januar harsche Kritik an der Weltgesundheitsorganisation (WHO) geäußert. Sie warfen der UN-Organisation vor, die Schweinegrippe voreilig zur Pandemie erklärt zu haben.

In Deutschland hatten die Bundesländer zunächst 50 Millionen Impfdosen bestellt. Im Januar einigten sie sich mit Pharmakonzern Glaxo-Smith-Kline (GSK) auf eine Reduzierung der Lieferung auf 34 Millionen Dosen. Da dies aber immer noch mehr als nötig ist, versucht Deutschland nun, den Rest an andere Länder zu verkaufen. In Frankreich wurden 80 Millionen Dosen bestellt, von denen nur ein kleiner Teil verwendet wurden. Auch Paris sucht nach Käufern für seinen überflüssigen Impfstoff.

Parliamentary Assembly
Assemblée parlementaire

PACE to hold a second public hearing into the handling of the Swine Flu pandemic

Strasbourg, PACE, 22 March 2010
http://rm.coe.int/090000168071ef01 // http://rm.coe.int/0900001680720950
http://rm.coe.int/09000016807216e8 // http://rm.coe.int/090000168071d44d
https://web.archive.org/web/20100327005922/http://assembly.coe.int/ASP/NewsManager/EMB_NewsManagerView.asp?ID=5393&L=2

Strasbourg, 22.03.2010 – The Parliamentary Assembly of the Council of Europe (PACE) is to hold a second public hearing on the subject "The handling of the H1N1 pandemic: more transparency needed" in Paris on Monday 29th March, followed by a press conference.

Participants at the hearing, organised by PACE's Committee on Social, Health and Family Affairs, include:

Polish Health Minister Ewa Kopacz, who will explain her government's response to the 'flu pandemic declared by the World Health Organisation – Poland decided not to order any H1N1 vaccines

Professor Marc Gentilini, an expert in infectious diseases, a member of the French National Academy of Medicine and a former President of the French Red Cross, who will assess France's response to the pandemic

Health researcher Dr Tom Jefferson of the independently-funded Cochrane Collaboration who will analyse the issue of the use of scientific evidence in influenza decision-making

Michèle Rivasi, a member of the Green Group in the European Parliament, who is calling for an inquiry by MEPs into the handling of the 'flu pandemic

The committee held a first public hearing in January, attended by representatives of the WHO, the pharmaceutical industry and independent health experts, following a motion by the outgoing Chair of PACE's Sub-committee on Health Wolfgang Wodarg on "faked pandemics".

It subsequently appointed Paul Flynn (United Kingdom, SOC) to prepare a report. He has already met British Minister of State for Public Health Gillian Merron as part of his inquiry, and will shortly visit the Geneva headquarters of the World Health Organisation (WHO) to put follow-up questions. The committee is due to approve his report at the end of April, for a possible plenary debate in Strasbourg in June.

***

Practical information for the media:

The hearing, which is open to the press, takes place at the Council of Europe office in Paris (55 avenue Kléber, Paris 16ème, Metro: Boissière) from 2 p.m. to 4.30 p.m. on Monday 29th March, followed by a press conference.

Video of the hearing and press conference (with interpretation into English and French) will be posted on the Assembly's website around an hour after they conclude at the following link: mms://coenews.coe.int/vod/100329_w01_w.wmv

Parliamentary Assembly
Assemblée parlementaire

Mr Paul Flynn
Rapporteur, United Kingdom, Socialist

Memorandum:
The handling of the H1N1 pandemic: more transparency needed

AS/Soc (2010) 12
Social, Health and Family Affairs Committee, PACE, 23 March 2010
http://assembly.coe.int/CommitteeDocs/2010/20100329_MemorandumPandemie_E.pdf

I. Introduction

1. The Parliamentary Assembly has always attentively observed governance issues of the public health sector in Council of Europe member states. The most recent reporting activities in this respect have been Recommendation 1725 (2005) on “Europe and bird flu – preventive measures in the health field”, Recommendation 1787 (2007) on “The precautionary principle and responsible risk management” and Resolution 1649 (2009) on “Palliative care: a model for innovative health and social policies”.

2. The rapporteur notes that the handling of the current H1N1 crisis is closely related to sensitive questions such as health experts’ contractual relations with private stakeholders and possible conflicts of interest, levels of public spending and, last but not least, important issues of health and well-being of individual patients and the population at large. Furthermore, the transparency of public health decisions is closely linked to the way in which sensitive issues are communicated to the European public. The rapporteur intends to take the ongoing debate on these topical issues to a more objective level.

3. At the level of the Council of Europe, member states undertake intergovernmental co-operation activities regarding health topics with a view to contributing to the development of an ethical European health policy. Some of the main topics include blood transfusion, mental health, palliative care, patient participation transplants, and also good governance in the health sector, as well as bioethics and the quality of medicines and healthcare. For the Council of Europe and its Parliamentary Assembly, the observation of public governance in the health care field is a particular priority.

4. The rapporteur does not wish to undertake a scientific analysis of the H1N1 flu virus, which would be the specific mission of other international or European bodies such as the World Health Organisation (WHO), the European Centre for Disease Prevention and Control (ECDC) or the European Medicines Agency (EMEA). His memorandum is based, rather, on the understanding that the questions of public health governance arising from the H1N1 crisis are essential issues of the rule of law and democracy which are ‘core values’ of the Council of Europe. The rapporteur’s main objective therefore is to identify and propose lines of action to enhance the transparency, accountability and coherence of the handling of future public health situations, whether these reach ‘pandemic’ levels or not.

5. With regard to public health issues at the Parliamentary Assembly, the rapporteur notably wishes to refer to the current report of his colleague, Ms Liliane Maury Pasquier (Switzerland, SOC), Chair of the Social, Health and Family Affairs Committee, on “Preventive Health Care Policies in the Council of Europe member states”. In her draft recommendation, Ms Maury Pasquier proposes that the Assembly urges Council of Europe member states to evaluate their preventive health care strategies, to renew their commitment towards the health goals of the World Health Organisation (WHO) and to actively co-operate with WHO, within the global surveillance system, in order to halt the expansion of infectious diseases. Taking this approach into account and despite some of the criticisms raised in this memorandum, the Parliamentary Assembly should recognise the outstanding achievements made in public health in past decades, and the valuable contribution to this by WHO. The Assembly should continue to support WHO to improve public health in all possible ways, including from a good governance and human rights perspective.

6. When examining the handling of the H1N1 influenza, the rapporteur also considers it important to closely co-operate with WHO and main European bodies, including the European Commission and Parliament, as well as national governments, the pharmaceutical industry, academia and civil society. This dialogue has already been launched at the public hearing held on 26 January during the 2010 first part-session of the Assembly, the results of which have been included in the present memorandum. This dialogue will continue at a hearing in Paris on 29 March 2010, with the participation of public health experts and representatives of European governments.

II. Announcement and perception of the H1N1 ‘Pandemic’

...

III. Critical views of the governance of the current H1N1 crisis and first evidence found

...

IV. Recent reactions of various stakeholders involved in the handling of the H1N1 influenza

a) Reactions of WHO at different times of the pandemic

...

b) Reactions of the pharmaceutical industry

...

c) Follow-up and reactions at the level of the European Union and European Parliament

...

d) Various reactions in Council of Europe member states

...

V. Conclusions

44. The recent debate on H1N1, notably at a European level, has shown that the situation relating to this influenza is characterised by a high degree of uncertainty. The rapporteur is convinced that the way in which the H1N1 crisis has been handled is lacking in transparency. Certain facts have never been communicated to the European public; others have not been presented clearly enough. Even in this advanced stage of debate, and notwithstanding the lack of transparency has been pointed out on various occasions, some stakeholders are still not ready to react fully to allegations made and make all possible information available.

45. Concluding this first round of reflection on the way in which the H1N1 pandemic was handled, the rapporteur notes that WHO and other public health institutions involved in public decisions on the pandemic, have ‘gambled away’ some of the confidence that the European public has in these highly reputed organisations. This decline in confidence could be risky in the future. When the next pandemic arises many persons may not give full credibility to recommendations put forward by WHO and other bodies. They may refuse to be vaccinated and may put their own health and lives at risk.

46. The rapporteur considers that any further investigation should focus on the question of how to strengthen and render irreproachable the surveillance mechanisms in place within and around WHO. It is essential in this respect to ensure the Organisation’s democratic accountability and transparency of decision-making in relation to its work, and finally to re-increase public confidence in WHO’s recommendations. There are important lessons to be learned for the future from the current H1N1 pandemic and the way in which it has been dealt with.

47. The search for improvements should firstly be undertaken through inter-organisational dialogues at national, European and international level. In this respect, the rapporteur welcomes the willingness of WHO and other organisations to participate in the public hearings and debates organised by the Parliamentary Assembly, and hopes that they will continue this dialogue with a view to pursuing the common objective of preparing for future public health situations where the same issues, including those of transparency, might be raised.

48. In parallel, national public health authorities of Council of Europe member states should also contribute to rendering public health decisions more transparent and accountable. This they should do by addressing some of these highly sensitive issues at national level, and by participating in relevant exchanges at the European level. One of the issues to be examined is the democratic control of international organisations such as WHO through relevant bodies (World Health Assembly, Regional Committees of WHO, etc.).

49. There are numerous organisations and institutions at international, European and national level which have been concerned by pandemic preparedness planning and the implementation of subsequent vaccination strategies. Amongst these, the Parliamentary Assembly provides a European platform where issues relating to human rights, the rule of law and democracy can be raised. In this function, the Parliamentary Assembly could remain a moderator and partner in debates. Beyond consideration of sensitive issues related to the current H1N1 crisis, and in consideration of the vast amount of work on common topics which are already the subject of exchanges between WHO and the Council of Europe, the Parliamentary Assembly could even provide a parliamentary forum for regular debates on the activities of WHO. By comparison, there is a yearly institutional dialogue between the Assembly and the Organisation for the Economic Co-operation and Development (OECD). Similarly there are regular reports of the Assembly on the activities of the United Nations High Commissioner for Refugees (UNHCR) and on the International Organization for Migration.

The Guardian

Sarah Boseley

WHO accused of losing public confidence over flu pandemic

The Guardian, 28 March 2010, 18:37 BST
https://www.theguardian.com/world/2010/mar/28/who-public-confidence-flu-pandemic

Loss of credibility could endanger lives, says vice chair of Council of Europe's health committee.

The World Health Organisation and other public health bodies have "gambled away" public confidence by overstating the dangers of the flu pandemic, according to a draft report to the Council of Europe.

The report, by the Labour MP Paul Flynn, vice chair of the council's health committee, says that a loss of credibility could endanger lives.

"This decline in confidence could be risky in the future," says the report, seen by the Guardian. "When the next pandemic arises many persons may not give full credibility to recommendations put forward by WHO and other bodies. They may refuse to be vaccinated and may put their own health and lives at risk."

In Britain, says Flynn, the discrepancy between the estimate of the numbers of people who would die from flu and the reality was dramatic. "In the United Kingdom, the Department of Health initially announced that around 65,000 deaths were to be expected. In the meantime, by the start of 2010, this estimate was downgraded to only 1,000 fatalities. By January 2010, fewer than 5,000 persons had been registered as having caught the disease and about 360 deaths had been noted," says his report.

The public health minister, Gillian Merron, told Flynn in a meeting for the report that a Cabinet Office investigation was looking into Britain's handling of the outbreak and would report some time after June. Countries across Europe reacted very differently to the pandemic, says the report. Not all mounted high-profile vaccination campaigns, as did the UK.

Flynn's draft accuses the WHO of a lack of transparency. Some members of its advisory groups are flu experts who have also received funding, especially for research projects, from pharmaceutical companies making drugs and vaccines against flu.

"The neutrality of their advice could be contested," says the report. "To date, WHO has failed to provide convincing evidence to counter these allegations and the organisation has not published the relevant declarations of interest. Taking such a reserved position, the organisation has joined other bodies, such as the European Medicines Agency, which likewise, have still not published such documents."

Flynn's report was commissioned by the Council of Europe's parliamentary assembly, which is holding an inquiry into the handling by European bodies and governments of the flu pandemic. The second evidence session will be held in Paris tomorrow. The witnesses will include the Polish health minister, Ewa Kopacz, who will explain why her government decided not to order any H1N1 vaccines.

At the first evidence session, in January, some experts criticised the dramatic comparisons made last year between the novel strain of H1N1 circulating in Europe and the devastating Spanish flu pandemic of 1918. Professor Ulrich Keil, epidemiologist and director of the WHO collaborating centre on epidemiology of the University of Münster in Germany pointed out in evidence that the Spanish flu broke out in the very different circumstances of the first world war, where infections were easily transmitted by undernourished soldiers and there was an absence of medicines such as penicillin.

One of the central questions of the Council of Europe inquiry, says Flynn, "concerns the possibility for representatives of the pharmaceutical industry to directly influence public decisions taken with regard to the H1N1 influenza, and the question of whether some of their statements had been adopted as public health recommendations without being based on sufficient scientific evidence". He cites as an example the decision to recommend two doses of flu vaccine for children, which was later questioned.

"Various factors have led to the suspicion that there may have been undue influence by the pharmaceutical industry, notably the possibility of conflicts of interest of experts represented in WHO advisory groups, the early stage of preparing contractual arrangements between member states and pharmaceutical companies as well as the actual profits that companies were able to realise as a result of the influenza pandemic," says the draft report, which will be finalised when all the evidence has been taken, at the end of April.

Assemblée parlementaire

Swine Flu:
'the next time someone cries wolf on a pandemic, it will not be taken seriously'

PACE: Social Affairs, Health and Sustainable Development, 29 March 2010
https://web.archive.org/web/20100403013623/http://assembly.coe.int/ASP/NewsManager/EMB_NewsManagerView.asp?ID=5415

Paris, 29.03.2010 – "*The next time someone cries wolf over a pandemic, the overwhelming majority will not take it seriously*," participants were told today at a parliamentary hearing on the handling of the H1N1 pandemic, organised in Paris by PACE's Social, Health and Family Affairs Committee.

"A pandemic cannot be whatever the WHO declares it is. If it turns out that former PACE member Wolfgang Wodarg was right when he said the pandemic was decided to help the pharmaceutical industry make bigger profits, this might well turn out to be one of the biggest health scandals ever," said **Paul Flynn** (United Kingdom, SOC), PACE rapporteur on this issue.

Participants also expressed regret at the WHO's failure to revise its position on the pandemic, and warned against a possible repetition of events if no lessons were learnt. "The world no longer trusts the WHO, but we need a body of this kind and it must therefore restore its own credibility," Mr Flynn added.

He paid tribute to the rare courage of the Polish Health Minister **Ewa Kopacz**, who had refused to be held hostage by the pharmaceutical industry and did not order vaccines. She said that drug company profit should not be more important than people.

She urged the WHO to urgently re-examine their position and decrease the pandemic alert level. She also denounced the lack of solidarity among European states when the pandemic was declared and the lack of co-ordination at EU level. **Marc Gentilini**, an expert in infectious diseases who is a former President of the French Red Cross, regretted that there was no such thing as a European health policy and called for the building of what he called a Europe of Health: "The precautionary principle is not a political umbrella to be abused," he said.

Health researcher **Tom Jefferson**, of the independently-funded Cochrane Collaboration, stressed that parliamentary democracy was the best means of ensuring that private interests do not prevail over the sovereignty of states: "We trust democracy to have a surveillance system that works. The public health sector may not rely on privatised expertise," he warned, underlining that so-called experts did not emerge like daisies but were "created and made into key opinion-leaders".

Michèle Rivasi, a member of the Green Group in the European Parliament, who is calling for an inquiry by MEPs into the handling of the 'flu pandemic, illustrated what she called "the chronicle of a pandemic foretold" and denounced the rush with which the WHO had announced the pandemic. She asked whether we were getting the whole truth from the WHO. She said it was important for PACE and the European Parliament to work together on this issue.

The participants also regretted that the WHO had not accepted the invitation to participate in this second hearing.

Parliamentary Assembly
Assemblée parlementaire

Address of Ms Ewa Kopacz, Minister of Health of Poland
Hearing on 'The handling of the H1N1: more transparency needed"
Parliamentary Assembly of the Council of Europe
Social, Health and Family Affairs Committee

Paris, PACE, 29 March 2010
https://archive.org/details/address-ek
http://assembly.coe.int/CommitteeDocs/2010/20100329_MinisterKopaczAddress.pdf

Madame Chair, Ladies and Gentleman,

Thank you much to the Parliamentary Assembly and the Council of Europe for taking up a subject that gave rise just recently to so much emotion and controversy. Thank you also for making it possible for the Polish Minister of Health to share her experience and the actions that we undertook during last year's flu pandemic. A pandemic whose announcement cost the world's tax payers hundreds and millions of Euros and at the same time ensured enormous additional profit for producers of vaccines for the pandemic.

Ladies and Gentleman the Polish reaction to this flu pandemic threat, a reaction which was quite different from those that prevailed in many other countries, was not the result of light-heartedness or slow decision making. From the time when in March April 2009 the first information was available about people falling ill with flu caused by a hitherto unknown virus called H1N1 Polish epidemiological and crisis reaction services immediately prepared themselves, analysed the situation and proposed appropriate measures to react to the possible threat. We also remained in close touch with the ECDC and other European and national centers designated to combat the new virus. Our actions were undertaken in accordance with a national pandemic plan developed on the basis of WHO's guidelines. Experts on epidemiology and infectious diseases issued recommendations for doctors and other healthcare professionals, we conducted a broad ranging informational educational campaign in particular aimed at children and school age youth and we also ensured that we combated symptoms of panic and general social unease.

It should be added that the relatively rapid announcement of successive levels of pandemic threat by WHO caused a lot of interest in the media which didn't really verify the significance of the figures that were provided and started to talk about upcoming 'apocalypse'. The media of course reminded societies of the famous 'Spanish' flu of 1918-1919 and the more recent avian flu which raised the level of social disquiet without the facts to support those statements. And that is why we prepared and transmitted information in accordance with our pandemic plan and we used the medical information available about the degree of threat but that was often marginalised by the media and they concentrated on the threat.

We also analysed the situation in the countries of the Southern Hemisphere where the flu season was underway and we were becoming very aware of the moderate nature this pandemic. All of this made it possible for us to serenely analyse the situation in so far as the alleged pandemic was concerned and to draw the appropriate conclusions. Ladies and Gentleman we wanted to take into consideration all possible scenarios so we invited pharmaceutical companies to negotiate with us, companies that were working on a vaccine against the H1N1 flu virus. The Polish Flu Pandemic

Committee had defined a high risk group including 2 millions persons in accordance with the recommendations of WHO and the ECDC and the Polish government set aside resources to buy appropriate numbers of vaccines but the conditions of purchase for vaccines proposed by producers were dubious for us, vaccines were to be purchased only by governments and not available directly to individuals, and to units of health care system, the producers of the vaccine expected that Polish government would take full responsibility for any undesirable side effects offering sale at the risk and on the responsibility of the purchaser.

For a long time it was also not clear whether each of us should be vaccinated once or twice and we were also concerned about information in the Euravigilin system about various undesirable effects and even the suspicion of some deaths. And the fact that the vaccine as offered was 2 to 3 times more expensive than vaccines against seasonal flu produced on the basis of the same technology is a fact on which I will not comment upon.

For these reasons the Polish government and I personally fully responsibly undertook a position not to purchase the vaccines on the conditions that were offered by pharmaceutical companies. I said at the time in the Polish parliament 'is it my responsibility to sign contracts in the interests of Poland or contracts in the interests of pharmaceutical companies?' I must admit that I said this as a doctor who has sworn to act for the good of patients and as a politician who has sworn to act in the interests of citizens. It is really not acceptable that producers of a medical vaccine thanks to the media campaign and taken advantage of fear that they should force government to take certain decisions; it is not acceptable for producers not to take responsibility for product for safety of patients and for undesirable side effects. It is not acceptable that governments should become hostages to interest groups and should take decision in an atmosphere of panic resulting from alarmist announcements in the media or the opinion of experts who have an interest in the situation themselves and who have not based their analysis on scientific terms, that is not acceptable at all.

Bitter thought to end, at the beginning of information becoming available 30 April 2009 during meeting Luxemburg during a meeting of Health Ministers of the European Union I talked about the need for coordination of purchases and distribution of vaccines by countries of the Union considering that combating the pandemic should be based on genuine European solidarity. I said that the criterion of access to the vaccines should not be how rich a country is but rather to what extent it is epidemiologically threatened. And I find it very painful to share with you the thought that there was no coordinated action by the community that the European answer to the pandemic threat which turned out to be not so serious as we initially thought has shown that in the European Union there is a deficit of solidarity and this lesson also shows that the announcement of each successive level and the scale of pandemic by WHO must be preceded by a very good scientific analysis and correct evaluation of the threat. Premature announcement of a pandemic, elimination of the criterion of the level of threat of the virus by WHO and using mainly the geographic criteria without taking into consideration the number of cases actually occurring within a given region has resulted in this excessive reaction by most countries in the world and I think that the international community is expecting now that WHO reduce the announced level of threat to the actual pandemic situation in individual regions of WHO which has not yet been the case.

And finally, this test was failed also and perhaps first and foremost by companies who produce vaccines because for them, corporate profit was more important than social responsibility. The experiences of last year's pandemic announcement are a very important lesson for us, we paid a very high cost – what is important now would be to draw the appropriate lessons from that experience.

Thank you.

Parliamentary Assembly
Assemblée parlementaire

Przemówienie Pani Ewy Kopacz,
Minister Zdrowia Rzeczypospolitej Polskiej
Wysłuchanie "Działania odnośnie grypy H1N1: potrzeba większej przejrzystości"
Zgromadzenie Parlamentarne Rady Europy
Komitet do Spraw Społecznych, Zdrowia i Rodziny

ParyŜ, 29 marca 2010 r.
http://assembly.coe.int/CommitteeDocs/2010/20100329_MinisterKopacz_PL.pdf

Szanowna Pani Przewodnicząca, Szanowni Państwo,

Dziękuję Zgromadzeniu Parlamentarnemu Rady Europy za podjęcie tematu, który nie tak dawno budził tak wiele emocji i kontrowersji. Dziękuję za moŜliwość podzielenia się przez polskiego ministra zdrowia naszymi doświadczeniami i działaniami podczas ubiegłorocznej pandemii grypy.

Pandemii, której ogłoszenie kosztowało podatników na całym świecie setki milionów euro, przysparzając producentom szczepionki pandemicznej, jak się szacuje, ogromnego dodatkowego zysku.

Szanowni Państwo,

Polska reakcja na zagroŜenie pandemią grypy, reakcja odmienna niŜ w wielu innych krajach, nie była spowodowana ani lekkomyślnością, ani opieszałością. Od chwili, gdy na przełomie marca i kwietnia 2009 roku pojawiły się pierwsze doniesienia o zachorowaniach na grypę spowodowanych nieznanym dotychcas wirusem, nazwanym A/H1N1, polskie słuŜby epidemiologiczne i reagowania kryzysowego niezwłocznie przeszły w stan wzmoŜonej gotowości, analizując sytuację i proponując odpowiednie środki odpowiedzi na ewentualne zagroŜenie. Pozostawaliśmy teŜ w łączności z ECDC i innymi europejskimi i narodowymi ośrodkami wyznaczonymi do walki z nowym wirusem. Nasze działania podejmowaliśmy zgodnie z opracowanym na podstawie wytycznych WHO Narodowym Planem Pandemicznym. Eksperci ds. epidemiologii, oraz chorób zakaźnych wydawali zalecenia dla lekarzy i innych pracowników ochrony zdrowia, prowadziliśmy szeroką kampanię informacyjną i edukacyjną kierowaną w szczególności do dzieci i młodzieŜy szkolnej. DuŜą wagę przywiązaliśmy teŜ do zwalczania objawów paniki i społecznego niepokoju, Trzeba tu dodać, Ŝe stosunkowo szybkie ogłaszanie kolejnych stopni zagroŜenia pandemicznego przez Światową Organizację Zdrowia spowodowało szerokie zainteresowanie mediów, które nie weryfikując znaczenia podawanych liczb wytworzyły obraz nadciągającej apokalipsy. Media przywoływały do pamięci społecznej słynną „hiszpankę” z lat 1918-19 i nieodległą grypę ptaków, co podwyŜszało stopień społecznego niepokoju w istotnym oderwaniu od faktów związanych z naturą tej pandemii - pandemii grypy A/H1N1 w przebiegu dość łagodnej. Dlatego teŜ przygotowana i przekazywana zgodnie z wytycznymi planu pandemicznego oraz wiedzą medyczną informacja nt. stopnia zagroŜenia, potencjalnych moŜliwości zakaŜenia oraz stosowania środków ochrony indywidualnej była w mediach bardzo często marginalizowana.

Analizowaliśmy takŜe sytuację w krajach półkuli południowej, gdzie właśnie trwał sezon grypowy i zdawaliśmy sobie sprawę z łagodnego charakteru pandemii.

To wszystko pozwoliło nam chłodno analizować sytuację pandemiczną i wyciągać z niej wnioski.

Panie i Panowie,

Biorąc pod uwagę kaŜdy scenariusz zaprosiliśmy do rozmów firmy farmaceutyczne, które podjęły prace nad szczepionką przeciwko grypie A/H1N1. Polski Komitet ds. Pandemii Grypy określił grupy szczególnego ryzyka, które objęły 2 miliony osób, zgodnie z rekomendacją WHO i ECDC. Polski rząd zabezpieczył środki na zakup odpowiedniej liczby szczepionek.

Jednak warunki zakupu szczepionek pandemicznych zaproponowane przez ich producentów wzbudziły w nas zasadnicze wątpliwości.

• Oferta sprzedaŜy nie przewidywała wprowadzania szczepionki do normalnego obrotu na rynku, lecz dotyczyła wyłącznie zakupu przez rząd. W konsekwencji szczepionka stawała się niedostępna dla jednostek ochrony zdrowia i osób prywatnych.

• Producenci szczepionki oczekiwali przejęcia przez polski rząd pełnej odpowiedzialności za działania niepoŜądane. czyli proponowały sprzedaŜ na ryzyko i odpowiedzialność nabywcy, w sytuacji, gdy oferowane szczepionki nie miały ukończonych badań klinicznych. Przez dłuŜszy czas nie było jasności co do liczby dawek (jedna czy dwie). Niepokoiły nas teŜ doniesienia o występowaniu działań niepoŜądanych (włącznie z podejrzeniami zgonów) wykazywane w systemie EUDRA-Vigilance.

• Fakt, Ŝe oferowane szczepionki były 2-3 krotnie droŜsze niŜ produkowane w tej samej technologii szczepionki przeciwko grypie sezonowej, pozostawiam bez komentarza.

Szanowni Państwo,

Z tych powodów z pełną odpowiedzialnością polski rząd i ja osobiście podjęliśmy decyzję o odstąpieniu od zakupu szczepionek na zaproponowanych warunkach. W polskim parlamencie powiedziałam wówczas tak: ”Czy moim obowiązkiem jest podpisywać umowy leŜące w interesie Polski, czy umowy leŜące w interesie koncernów farmaceutycznych?” Mówiłam to jako lekarz przyrzekający działać dla dobra pacjentów i jako polityk, przyrzekający działać dla dobra obywateli

• Nie moŜe bowiem być tak, Ŝe producenci szczepionek pod osłoną kampanii medialnych i wykorzystując usprawiedliwiony strach ludzi przed chorobami - stawiają rządy pod ścianą

• Nie moŜe być tak, Ŝe producenci leków nie biorą odpowiedzialności za swój produkt, za bezpieczeństwo pacjenta, za działania niepoŜądane

• Nie moŜe być tak, Ŝe rządy stają się zakładnikami grup interesów i podejmują decyzje w atmosferze paniki wywołanej alarmistycznymi doniesieniami medialnymi, oraz opiniami ekspertów, które są elementem gry interesów i nie mają wiele wspólnego z rzeczową analizą sytuacji

Na to zgody być nie moŜe!

Szanowni Państwo

I na koniec pewna gorzka refleksja:

Na początku europejskiej odsłony pandemii, 30 kwietnia 2009 w Luksemburgu, podczas spotkania ministrów zdrowia Unii Europejskiej mówiłam o konieczności koordynacji zakupów i dystrybucji szczepionek przez kraje Unii, widząc we wspólnym zwalczaniu pandemii waŜny dowód prawdziwej europejskiej solidarności. Mówiłam, Ŝe kryterium dostępności do szczepionki nie powinna być zasobność kraju, lecz jego sytuacja epidemiologiczna. Boleję nad tym, Ŝe nie doszło do skoordynowanych działań Wspólnoty, Ŝe europejska odpowiedź na zagroŜenie pandemiczne, które na szczęście nie okazało się tak groźne, jak pierwotnie sądzono, pokazało, Ŝe we wspólnej Europie istnieje jednak deficyt solidarności.

Ta lekcja pokazała takŜe, Ŝe ogłaszanie kaŜdego kolejnego stopnia w skali pandemicznej przez WHO musi być poprzedzone rzetelną analizą i prawidłową oceną zagroŜenia. Zbyt pochopne ogłaszanie pandemii, eliminacja kryterium zjadliwości wirusa i oparcie się przez WHO głównie na kryterium geograficznym, bez uwzględnienia liczby występujących w danym regionie zachorowań, spowodowało, Ŝe mieliśmy do czynienia z nadmierną reakcją większości państw świata. Do dziś formalnie obowiązuje szósty stopień zagroŜenia pandemicznego i społeczność międzynarodowa oczekuje od WHO obniŜenia stopnia zagroŜenia stosowanie do realnej sytuacji pandemicznej w poszczególnych regionach WHO.

Wreszcie tego testu nie przeszły takŜe, a moŜe przede wszystkim firmy produkujące szczepionki, skoro przedłoŜyły uzyskanie zysku korporacyjnego za wszelką cenę ponad deklarowaną społeczną odpowiedzialność.

Doświadczenia związane z ogłoszoną w zeszłym roku pandemią są dla nas wszystkich cenną lekcją. Zapłaciliśmy za nią bardzo wymierną cenę. Chodzi o to, by z tej lekcji wyciągnąć odpowiednie wnioski.

Swine Flu:
'the next time someone cries wolf on a pandemic, it will not be taken seriously

The Pharma Letter, 31 March 2010
https://www.thepharmaletter.com/pharmaceutical/swine-flu-the-next-time-someone-cries-wolf-on-a-pandemic-it-will-not-be-taken-seriously

"The next time someone cries wolf over a pandemic, the overwhelming majority will not take it seriously,' participants were told this week at a parliamentary hearing on the handling of the H1N1 pandemic, organized in Paris, France, by the Parliamentary Assembly of the Council of Europe (PACE) Social, Health and Family Affairs Committee.

The meeting was in response to criticism of the World Health Organization's handling of the H1N1 influenza pandemic, and alleged influence of the pharmaceutical industry in causing the situation, and follows a public hearing by the PACE committee in January (The Pharma Letters passim).

'A pandemic cannot be whatever the WHO declares it is. If it turns out that former PACE member Wolfgang Wodarg was right when he said the pandemic was decided to help the pharmaceutical industry make bigger profits, this might well turn out to be one of the biggest health scandals ever,' said Paul Flynn (UK, SOC), PACE rapporteur on this issue.

Canadian urges government to follow Council of Europe investigation on false swine flu pandemic

The Flu Case, 3 April 2010, 14:29
https://web.archive.org/web/20100613225013/http://www.theflucase.com/index.php?option=com_content&view=article&id=3203%3Acanadian-urges-government-to-follow-council-of-europe-investigation-on-false-swine-flu-pandemic&catid=1%3Alatest-news&Itemid=64&lang=en

"Parlementary Assembly of the Council of Europe - WHO and The False H1N1 Pandemic Flu The Medical Swindle of the 21st Century

Ladies and Gentlemen,

The invitation is launched to Minister of Health of the Government of CANADA, Madam Leona Aglukkaq, to the chief Administrator of the public health of CANADA, Dr David Butler-Jones (see French version for all the links), to Minister of Health and social services of QUEBEC, Dr Yves Bolduc, to the Deputy minister of health and the National Director of the Public health of QUEBEC, Dr Alain Poirier, to the Director of the public health of QUEBEC, Dr Horacio Arruda, to the President of Specialists Medical Doctors of QUEBEC, Dr Gaétan Barrette, to the deputy of the Québec Solidaire party elected in the National Assembly of Quebec, Dr Amir Khadir, to the journalists of Radio-Canada and LCN, and to quite other participant «aware or not of its acts» in health at the service of Money by means of the disease set up as system as well as of the media propaganda, to view the auditions of the Council of Europe in the business affair of the medical swindle of the 21st century of false pandemic of swine flu H1N1, which all participated, without any exception, nor limitation, in cooperation with the WHO and with the pharmaceutical criminalized multinational GlaxoSmithKline, in the systematic implementation as well as in the systematic execution of this national swindle operated deliberately in any lucidity, on the head of the people of CANADA and QUEBEC.

Our most sincere thanks are thus sent to you because you contribute powerfully well in spite of you to the awakening of the Consciousness and to the stake of the shadow in light.

See references on the Web site of the Council of Europe: flu A: «the next time which we shall shout in the wolf about a pandemic, it will not be seriously taken» http://assembly.coe.int/DefaultF.asp

See the 2nd audition of more than two hours having taken place this week. Several important personalities were there, in particular Minister of Health of Poland, Dr Ewa Kopasz, (the only one who said NO VACCINE FOR OUR PEOPLE) and Mr. Paul Flynn, of the advice of the European parliament.

See Paul Flynn's memorandum

The invitation is launched to the population of QUEBEC and CANADA, to refuse at all costs, «to gulp down» any information resulting from media and from politics of any quality. Invitation to close radios and televisions and to open the eye because everything is not ended concerning the progress of the Illuminati schedule.

THE FLU CASE

Jean-Paul: Massie

Assemblée Parlementaire du Conseil de l'Europe –
L'OMS et LA Fausse Pandémie de Grippe H1N1
L'Escroquerie Médicale du 21e Siècle

Cordial greetings,
Mesdames et Messieurs,

L'invitation est lancée Ã la ministre de la santé du gouvernement du CANADA, Madame Leona Aglukkaq, Ã l'Administrateur en chef de la santé publique du CANADA, le Dr David Butler-Jones, au ministre de la santé et des services sociaux du QUÉBEC, le Dr Yves Bolduc, au Sous-ministre de la santé et directeur National de la Santé publique du QUÉBEC, le Dr Alain Poirier, au directeur de la santé publique de QUÉBEC, le Dr Horacio Arruda, au président des Médecins spécialistes du QUÉBEC, le Dr Gaétan Barrette, au député du parti Québec Solidaire élu Ã l'Assemblée Nationale, le Dr Amir Khadir, aux journalistes de Radio-Canada et de LCN, et Ã tout autre intervenant «conscient ou non de ses actes» en matière de santé au service de l'Argent par le biais de la maladie érigée en système ainsi que de propagande médiatique, de visionner les auditions du Conseil de l'Europe dans l'affaire de l'escroquerie médicale du 21e siècle de fausse pandémie de grippe porcine H1N1, lesquels ont tous participés, sans aucune exception ni restriction, de concert avec l'OMS et la multinationale pharmaceutique criminalisée GlaxoSmithKline, Ã la mise en place systémique ainsi qu'Ã l'exécution systématique de cette escroquerie nationale opérée sciemment en toute lucidité, sur le dos des populations du CANADA et du QUÉBEC.

Nos remerciements les plus sincères vous sont donc adressés car vous contribuez puissamment bien malgré vous Ã l'éveil de la Conscience et Ã la mise de l'ombre en lumière.

Rory Watson

WHO is accused of "crying wolf" over swine flu pandemic

British Medical Journal, 6 April 2010
340 doi: https://doi.org/10.1136/bmj.c1904 // https://www.bmj.com/content/340/bmj.c1904.full

Three separate international inquiries will soon be investigating the World Health Organization's decision to declare the H1N1 virus a pandemic. The most advanced, being conducted by the Council of Europe, began in January.

Also, support is growing inside the European parliament for members to conduct their own investigation, and WHO itself will set up an independent review committee later this month.

Paul Flynn, the British Labour MP who is drafting the report of the Council of Europe's investigation into the pandemic, believes that the discrepancy between the scale of the warnings and the actual effect of the virus has badly dented public confidence in WHO and many public health institutions.

"The next time someone cries wolf over a pandemic, the overwhelming majority will not take it seriously. A pandemic cannot be whatever the WHO declares it is," he told a public hearing on the handling of the H1N1 pandemic (the second organised by the Council of Europe) in Paris on 29 March.

He warned that if it transpired that the pandemic label had been attached to the virus to help the drug industry to make bigger profits, "this might turn out to be one of the biggest health scandals ever."

Poland's health minister, Ewa Kopacz, explained to the hearing why her government had refused to launch a vaccination campaign after the WHO alert. The country's experts had concluded that the situation was not as serious as portrayed, and the government had refused to accept the drug companies' conditions that it, rather than the manufacturers, should bear full responsibility for any undesirable side effects of the vaccines.

While the Council of Europe is trying to shed light on whether undue industry influence or conflicts of interest were involved in WHO's decision, the European parliament is approaching the issue from a different angle. A French Green MEP, Michèle Rivasi, is leading a move to establish a special committee of inquiry. This would investigate why European Union institutions such as the European Medicines Agency and the European Centre for Disease Prevention and Control uncritically followed WHO's decision without carrying out their own independent evaluation of the threats involved.

This led, she points out, to the European Medicines Agency giving fast track approval to vaccines whose impact on pregnant women and children had not been fully assessed. Ms Rivasi is confident that she will win the backing of the 183 MEPs she requires for the committee of inquiry to be created.

Finally, WHO will establish its own independent review committee of 29 experts at a meeting on 12-14 April. Announcing the initiative on the same day as the Council of Europe hearing in Paris, Keiji Fukuda, the special adviser to WHO's director general on pandemic influenza, insisted that the committee would have full control over the way it conducts its work. It will present its report to next year's World Health Assembly. ...

THE FLU CASE

Polish health minister testifies against swine flu jabs, half Polish government wiped out in plane crash days later

The Flu Case, 3 May 2010, 12:16
https://web.archive.org/web/20100517152645/http://www.theflucase.com/index.php?option=com_content&view=article&id=3378%3Apolish-health-minister-testifies-against-swine-flu-jabs-half-polish-government-wiped-out-in-plane-crash-days-later&catid=41%3Ahighlighted-news&Itemid=105&lang=en

On March 29th, Polish Health Minister Ewa Kopacz gave a devastating critique in Paris of the pharmaceutical companies, WHO and the pressure they had put on her to sign contracts for untested pandemic vaccines.

Kopacz was the only health minister to refuse the vaccine.

The Council of Europe Parliamentary Assembly inquiry into the pandemic found her to have acted correctly, saving the countries millions of euros.

When the Polish Health Minister stood up for Poland, she stood up for all people in Europe and the USA.

Ewa Kopacz helped us all to refuse the swine flu vaccination last autumn.

Days after her testimony in Paris, on April 10th, the *backbone of the Polish government was wiped out in a plane crash*.

There are many signs that this plane crash in Smolensk was engineered.

Is this a coincidence?

On April 13th, WHO flu chief Keiji Fukuda blamed the failed mass swine flu vaccination campaign on the internet for producing "news, rumours, a great deal of speculation and criticism in multiple outlets," including blogs, social networking and websites.

=> http://www.google.com/hostednews/afp/article/ALeqM5hTYjXT1VALSJAJKgjnRtFE3bom1Q

On April 16th, theflucase website was taken down, and has only just returned after a big struggle.

Is this a coincidence?

Is it a coincidence that the flucase went down just as the investigations into the Polish plane crash gathered pace, also on this website. and as the evidence grew that this was calculated, deliberate mass murder of the Polish elite?

Fortunately, I was able to activate my old blog - but attempts to transmit live video from Krakow where the funeral of President Lech Kaczynski took place were stopped. The IP address was blocked within two minutes each time.

Another video had to be put up twice because of interference. The counter of the video was blocked constantly. Marek Podlecki, the cameraman, got what appeared to be death threats by sms.

In short, everything was done to stop information on the plane crash spreading.

As a result of the deaths of the Polish elite, including the country's central bank governor, the Polish Prime Minister Donald Tusk can now impose vaccinations and the euro more easily on Poland as well as open the country's economy to the bankers.

Goldman Sachs which has a big stake in pharmaceutical companies that have seen vaccine orders cancelled and also in the banks that will profit from the euro and the raft of privatisations is now planning to set up a new office in Warsaw headed by a man fired by killed Lech Kaczynski.

Is this a coincidence?

Thanks to the internet, the information, facts and evidence showing that the plane crash in Smolensk was deliberate have spread very quickly.

The Polish people will hardly accept the state prosecutor sitting on the evidence of this appalling crime.

It is unacceptable that WHO, pharmaceutical companies and banks resort to what appear to be mafia methods.

It is unacceptable that the only country to reject the swine flu vaccine loses half its government within days of a key hearing in an obviously engineered plane crash.

It is unacceptable that websites like mine are de facto hacked and censored for giving facts, documents and evidence pointing to the dangers of this vaccine - quite apart from a campaign of viliification etc.

When the Polish Health Minister stood up for Poland, she stood up for all people in Europe and the USA.

It is time for us, the people in Europe and the USA, to stand up for the people of Poland, who are being subjected to such a brutal attack.

This is an extract from Kopacz's speech to the Council of Europe inquiry on March 29th:

For these reasons the Polish government and I personally fully responsibly undertook a position not to purchase the vaccines on the conditions that were offered by pharmaceutical companies.

I said at the time in the Polish parliament 'is it my responsibility to sign contracts in the interests of Poland or contracts in the interests of pharmaceutical companies?'

I must admit that I said this as a doctor who has sworn to act for the good of patients and as a politician who has sworn to act in the interests of citizens.

It is really not acceptable that producers of a medical vaccine thanks to the media campaign and taken advantage of fear that they should force government to take certain decisions; it is not acceptable for producers not to take responsibility for product for safety of patients and for undesirable side effects.

It is not acceptable that governments should become hostages to interest groups and should take decision in an atmosphere of panic resulting from alarmist announcements in the media or the opinion of experts who have an interest in the situation themselves and who have not based their analysis on scientific terms, that is not acceptable at all."

EU parliament urged to investigate H1N1 outbreak

The Parliament, 5 May 2010
https://web.archive.org/web/20100511140547/http://www.theparliament.com/no_cache/latestnews/news-article/newsarticle/eu-parliament-urged-to-investigate-h1n1-outbreak/

More than 200 deputies have signed a proposal calling for a special committee on the H1N1 pandemic.

The members, who come from across the political divide, said one of its aims would be to evaluate the EU's dependence on the World Health Organisation.

Speaking at a news conference in parliament on Wednesday, Belgian Greens MEP Isabelle Durant said the management of the outbreak had "seriously undermined the credibility of, and confidence in our institutions".

She is one of the MEPs who have sent a letter to parliament's president Jerzy Buzek asking him to set up a committee to investigate last year's outbreak.

The letter says, "Member states have reportedly spent billions on anti-H1N1 vaccines despite the fact that shortly after it emerged, it was found to cause only mild illness.

"The number of deaths due to H1N1 is very small compared to those estimated for seasonal influenza."

It adds, "It is of paramount importance to ensure future EU pandemic responses carefully assess the nature of the pandemic and the risks of vaccination strategies."

Another signatory, Polish EPP member Boguslaw Sonik said, "We want to know why the commission and public health authorities did not issue a statement modifying their initial strategy.

"Also, why did the EU institutions not provide the public and media with good, objective up-to-date communication?"

According to data from the European Centre for Disease Prevention and Control, H1N1 caused 1528 deaths.

In comparison, commission statistics show that seasonal influenza causes some 40,000 deaths in an average year and up to 220,000 in a severe year.

The pandemic that never was:
Drug firms 'encouraged world health body to exaggerate swine flu threat'

Daily Mail, 4 June 2010, 23:49 BST
https://www.dailymail.co.uk/news/article-1284133/The-pandemic-Drug-firms-encouraged-world-health-body-exaggerate-swine-flu-threat.html

Declaring a swine flu pandemic was a 'monumental error', driven by profit-hungry drug companies spreading fear, an influential report has concluded.

It led to huge amounts of taxpayers' money being wasted in stockpiling vaccines, it added.

Paul Flynn, the Labour MP charged with investigating the handling of the swine flu outbreak for the Council of Europe, described it as 'a pandemic that never really was'.

The report accuses the World Health Organisation of grave shortcomings in the transparency of the process that led to its warning last year.

The MP said that the world relied on the WHO, but after 'crying wolf', its reputation was in jeopardy.

The report questions whether the pandemic was driven by drug companies seeking a profit. Mr Flynn said predictions of a 'plague' that would wipe out up to 7.5million people proved to be 'an exaggeration', with fewer than 20,000 deaths worldwide.

Britain braced itself for up to 65,000 deaths and signed vaccine contracts worth £540 million.

The actual number of deaths was fewer than 500 and the country is now desperately trying to unpick the contracts and unload millions of unused jabs.

The focus on swine flu also led to other health services suffering and widespread public fear.

Pharmaceutical companies, however, profited to the tune of £4.6billion from the sale of vaccines alone.

Mr Flynn said: 'There is not much doubt that this was an exaggeration on stilts. They vastly over-stated the danger on bad science and the national governments were in a position where they had to take action.

'In Britain, we have spent at least £1billion on preparations, to the detriment of other parts of the health system. This is a monumental failure on the WHO's part.'

The Council of Europe inquiry heard allegations that the WHO had downgraded its definition for declaring a pandemic last spring - just weeks before announcing there was a worldwide outbreak.

Critics said the decision to remove any need to consider the deadliness of the disease was driven by drug companies desperate to recoup the billions of pounds they had invested in developing pandemic vaccines after the bird flu scares.

But the WHO said its basic definition of a pandemic never changed.

Mr Flynn said: 'It doesn't make any sense as to why they should have changed the definition a month before declaring an outbreak.

'In this case, it might not just be a conspiracy theory, it might be a very profitable conspiracy.'

A Daily Mail investigation earlier this year revealed more than half of the swine flu taskforce advising the Government on its strategy had ties to drug companies.

Eleven of the 20 members of the Scientific Advisory Group for Emergencies had done work for the pharmaceutical industry or are linked to it through their universities.

Concerns about drug companies' influence are also highlighted by a separate investigation by the British Medical Journal and the London-based Bureau of Investigative Journalism.

It found that key scientists behind the WHO's advice on stockpiling pandemic flu pills such as Tamiflu had financial ties with the drug companies that stood to profit. The WHO last night firmly rejected all the criticism.

Spokesman Gregory Hartl said: 'There is no question of this being a fake pandemic. If fits the criteria for a pandemic, which is a new virus to which human beings have little or no immunity and which has spread around the world.

'It spread from zero to 74 countries in the space of 9 weeks – that's a pandemic.'

He said that not all ties to drug companies were necessarily conflicts of interest.

The handling of the H1N1 pandemic: more transparency needed. Report

Strasbourg, Council of Europe, Social Health and Family Affairs Committee, 4 June 2010
http://assembly.coe.int/CommitteeDocs/2010/20100604_H1N1pandemic_e.pdf

Parliamentary Assembly
Assemblée parlementaire
http://assembly.coe.int

COUNCIL OF EUROPE CONSEIL DE L'EUROPE

PROVISIONAL VERSION

The handling of the H1N1 pandemic: more transparency needed

Report
Social Health and Family Affairs Committee
Rapporteur: Mr Paul FLYNN, United Kingdom, SOC

A. Draft resolution

1. The Parliamentary Assembly is alarmed about the way in which the H1N1 influenza pandemic has been handled, not only by the World Health Organization (WHO), but also by the competent health authorities at the level of the European Union and at national level. It is particularly troubled by some of the consequences of decisions taken and advice given leading to distortion of priorities of public health services across Europe, waste of large sums of public money, and also unjustified scares and fears about health risks faced by the European public at large.

2. The Assembly notes that grave shortcomings have been identified regarding the transparency of decision-making processes relating to the pandemic which have generated concerns about the possible influence of the pharmaceutical industry on some of the major decisions relating to the pandemic. The Assembly fears that this lack of transparency and accountability will result in a plummet in confidence in the advice given by major public health institutions. This may prove disastrous in the case of the next disease of pandemic scope - which may turn out to be much more severe than the H1N1 pandemic.

3. The Assembly recalls its previous work on good governance in the public health sector in Council of Europe member states, in particular Recommendation 1725 (2005) on "Europe and bird flu – preventive measures in the health field" and Recommendation 1787 (2007) on "The precautionary principle and responsible risk management". In Recommendation 1908 (2010) on "Lobbying in a democratic society (European Code of conduct on lobbying)", the Assembly noted that unregulated or secret lobbying may be a danger and can undermine democratic principles and good governance.

4. On a positive note, the Assembly welcomes the review and evaluation processes regarding the handling of the H1N1 pandemic recently launched or about to be launched by WHO, European institutions dealing with health issues and a number of national governments and parliaments. The Assembly urges all parties concerned to continue and reinforce dialogue between public health institutions at all levels and hold more regular exchanges on good governance in the health sector in the future.

5. Notwithstanding the willingness of WHO and the European health institutions concerned to enter into a dialogue and conduct a review of the handling of the pandemic, the Assembly seriously regrets that they have not been willing to share some essential information, in particular to publish the names and declarations of interest of the members of the Emergency Committee of WHO and relevant European advisory bodies directly involved in recommendations concerning the handling of the pandemic. Furthermore the Assembly regrets that WHO has not moved swiftly to revise or re-evaluate its position on the pandemic and the real health risks involved, despite the overwhelming evidence that the seriousness of the pandemic was vastly overrated by WHO at the outset. In addition the Assembly regrets the highly defensive stance taken by WHO, whether in terms of being unwilling to accept that a change in definition of a pandemic was made, or an unwillingness to revise its prognosis on the pandemic.

6. In the light of the widespread concerns raised over the handling of the H1N1 pandemic, the Assembly calls on public health authorities at international, European and national level – and notably WHO– to address in a transparent manner the criticisms and disquiet raised in the course of the H1N1 pandemic, by:

PACE Health Committee denounces 'unjustified scare' of Swine Flu, waste of public money

Strasbourg, PACE, 4 June 2010
https://pace.coe.int/en/news/2937/pace-health-committee-denounces-unjustified-scare-of-swine-flu-waste-of-public-money

Strasbourg, 04.06.2010 – The handling of the H1N1 pandemic by the World Health Organization (WHO), EU agencies and national governments led to a "waste of large sums of public money, and unjustified scares and fears about the health risks faced by the European public", according to a report by the Social, Health and Family Affairs Committee of the Parliamentary Assembly of the Council of Europe (PACE) made public today in Paris.

The report, prepared by Paul Flynn (United Kingdom, SOC) and approved today by the committee ahead of a plenary debate at the end of this month, says there was "overwhelming evidence that the seriousness of the pandemic was vastly overrated by WHO", resulting in a distortion of public health priorities.

Presenting his report, Mr Flynn told the committee: "this was a pandemic that never really was", and described the vaccination programme as "placebo medicine on a large scale" (see video below).

In its adopted text, the committee identifies what it calls "grave shortcomings" in the transparency of decision-making about the outbreak, generating concerns about the influence of the pharmaceutical industry on decisions taken. Plummeting confidence in such advice could prove "disastrous" in the case of a severe future pandemic, it warns.

In particular, the WHO and European health institutions were not willing to publish the names and declarations of interest of the members of the WHO Emergency Committee and relevant European advisory bodies directly involved in recommendations concerning the pandemic, the parliamentarians point out.

However, attending the meeting was Fiona Godlee, the Editor-in-Chief of the British Medical Journal, who told the parliamentarians that, according to an investigation by her journal, scientists who drew up key WHO guidelines on stockpiling flu vaccines and drugs had previously been paid by drug companies which stood to profit.

The WHO has been "highly defensive", the committee said, and unwilling to accept that a change in the definition of a pandemic was made, or to revise its prognosis of the Swine Flu outbreak.

The committee sets out a series of urgent recommendations for greater transparency and better governance in public health, as well as safeguards against what it calls "undue influence by vested interests". It also calls for a public fund to support independent research, trials and expert advice, possibly financed by an obligatory contribution of the pharmaceutical industry, as well as closer collaboration with the media to avoid "sensationalism and scaremongering in the public health domain".

The report is due to be debated by parliamentarians from all 47 Council of Europe member states on Thursday 24 June during PACE's summer session in Strasbourg.

Report condemns swine flu experts' ties to big pharma
Trio of scientists who urged stockpiling had previously been paid, says report

The Guardian, 4 June 2010, 00.34 BST
https://www.theguardian.com/business/2010/jun/04/swine-flu-experts-big-pharmaceutical

Scientists who drew up the key World Health Organisation guidelines advising governments to stockpile drugs in the event of a flu pandemic had previously been paid by drug companies which stood to profit, according to a report out today.

An investigation by the British Medical Journal and the Bureau of Investigative Journalism, the not-for-profit reporting unit, shows that WHO guidance issued in 2004 was authored by three scientists who had previously received payment for other work from Roche, which makes Tamiflu, and GlaxoSmithKline (GSK), manufacturer of Relenza.

City analysts say that pharmaceutical companies banked more than $7bn (£4.8bn) as governments stockpiled drugs. The issue of transparency has risen to the forefront of public health debate after dramatic predictions last year about a swine flu pandemic did not come true.

Some countries, notably Poland, declined to join the panic-buying of vaccines and antivirals triggered when the WHO declared the swine flu outbreak a pandemic a year ago this week. The UK, which warned that 65,000 could die as a result of the virus, spent an estimated £1bn stockpiling drugs and vaccines; officials are now attempting to unpick expensive drug contracts.

The cabinet office has launched an inquiry into the cost to the taxpayer of the panic-buying of drugs.

Today, the Council of Europe, produces a damning report into how a lack of openness around "decision making" has bedevilled planning for pandemics.

"The tentacles of drug company influence are in all levels in the decision-making process," said Paul Flynn, the Labour MP who sits on the council's health committee. "It must be right that the WHO is transparent because there has been distortion of priorities of public health services all over Europe, waste of huge sums of public money and provocation of unjustified fear."

Although the experts consulted made no secret of industry ties in other settings, declaring them in research papers and at universities, the WHO itself did not publicly disclose any of these in its seminal 2004 guidance. In its note, the WHO advised: "Countries that are considering the use of antivirals as part of their pandemic response will need to stockpile in advance."

Many nations would adopt this guidance, including Britain. In 2005, the government said it had begun bulk-buying the drug Tamiflu, initially ordering 14.6m doses after bird flu killed 40 in Asia.

The specific guidance on antivirals was written by Professor Fred Hayden. He has confirmed in an email that he was being paid by Roche for lectures and consultancy work at the time the guidance was produced and published. He received payments from GSK for consultancy and lecturing until 2002. He said "[declaration of interest] forms were filled out for the 2002 consultation".

The previous year Hayden was also one of the main authors of a Roche-sponsored study that asserted what was to become a main Tamiflu selling point – its claim of a 60% reduction in flu hospitalisations.

Dr Arnold Monto was the author of the WHO annex dealing with vaccine usage in pandemics. Between 2000 and 2004, and at the time of writing the annex, Monto had openly declared consultancy fees and research support from Roche and GSK. No conflict of interest statement was included in the annex published by the WHO.

When asked if he had signed a declaration of interest form for WHO, Dr Monto said "conflict of interest forms are requested before participation in any WHO meeting".

The third scientist, Professor Karl Nicholson, is credited with the WHO's influential work Pandemic Influenza. According to declarations he made in the BMJ and Lancet in 2003, he had received sponsorship from GSK and Roche.

Even though the previous year these declarations had been openly made, no conflict of interest statement was included in the annex. Nicholson said he last had "financial relations" with Roche in 2001.

When asked if he had signed a declaration of interest form for WHO, he replied: "The WHO does require attendees of meetings, such as those held in 2002 and 2004, to complete declarations of interest."

A WHO official told the BMJ it had to balance an individual's privacy with the robustness of guidelines, which were subject to a wide external review process.

Council of Europe condemns "unjustified scare" over swine flu

BMJ, 7 June 2010; 340; doi: https://doi.org/10.1136/bmj.c3033
https://www.bmj.com/content/340/bmj.c3033

The Council of Europe has heavily criticised the World Health Organization, national governments, and EU agencies for their handling of the swine flu pandemic.

The parliamentary assembly of the council – the international organisation that protects human rights and the rule of law in Europe – published a draft of a report that reviewed how the H1N1 pandemic was handled.

National governments, WHO, and EU agencies had all been guilty of actions that led to a "waste of large sums of public money, and unjustified scares and fears about the health risks faced by the European public," says the report.

The conclusion came in the parliamentary assembly's social, health and family affairs committee report published on 4 June.

The report was prepared by Paul Flynn, socialist member of the assembly and Labour MP for Newport West and approved by the committee ahead of a plenary debate at the end of this month. It says there was overwhelming evidence that the seriousness of the pandemic was vastly over-rated by WHO, which led to a distortion of public health priorities.

Presenting his report at a committee meeting in Paris, Mr Flynn said, "This was a pandemic that never really was."

The committee said there were "grave shortcomings" in the transparency of decision making about the outbreak ...

Handling of the H1N1 pandemic
PACE calls for safeguards against 'undue influence by vested 'interests'

Strasbourg, Council of Europe, 24 June 2010
https://pace.coe.int/en/news/2996

Strasbourg, 24.06.2010 – At the end of a debate on the handling of the H1N1 pandemic, the Council of Europe Parliamentary Assembly (PACE) today endorsed the conclusions of its Health Committee, which were published on 4 June last.

According to the Assembly, the handling of the pandemic by the World Health Organization (WHO), EU health agencies and national governments led to a "waste of large sums of public money, and unjustified scares and fears about the health risks faced by the European public". The adopted text says there was "overwhelming evidence that the seriousness of the pandemic was vastly overrated by WHO", resulting in a distortion of public health priorities.

The parliamentarians indentified, as did the rapporteur Paul Flynn (United Kingdom, SOC), "grave shortcomings" in the transparency of decision-making about the outbreak, generating concerns about the influence of the pharmaceutical industry on decisions taken. Plummeting confidence in such advice could prove "disastrous" in the case of a severe future pandemic, they said.

The WHO has been "highly defensive", the adopted text underlines, and unwilling to accept that a change in the definition of a pandemic was made, or to revise its prognosis of the Swine Flu outbreak. The WHO and European health institutions were not willing to publish the names and declarations of interest of the members of the WHO Emergency Committee and relevant European advisory bodies directly involved in recommendations concerning the pandemic.

The Assembly did set out a series of urgent recommendations for greater transparency and better governance in public health, as well as safeguards against what it called "undue influence by vested interests". It called for a public fund to support independent research, trials and expert advice, possibly financed by an obligatory contribution of the pharmaceutical industry. " It also called the media to avoid "sensationalism and scaremongering in the public health domain".

Risk = Hazard + Outrage

Peter M. Sandman and Jody Lanard

The "Fake Pandemic" charge goes mainstream and WHO's credibility nosedives

Risk, Hazard, Outrage, 29 June 2010
http://www.psandman.com/col/WHO-credibility.htm

In other words, there is no clear evidence yet that pandemic H1N1 is or is not going to "act" like a seasonal flu strain from now on, which is what former pandemic flu strains have done after 1–3 years. That's certainly one of the possibilities, but there are two others. It could cause additional pandemic waves more or less like the ones it has already caused. Or it could get a lot more virulent – which most experts don't expect at this point but don't rule out either. (Experts do remember that the mild 1968 pandemic returned to cause a more severe European wave in the winter of 1969–1970, a full year after the very mild first European wave. Almost anything is possible with influenza.)

The pandemic is like a hurricane that initially and briefly looked like it might be a Category 4 whopper, turned out to be just barely a Category 1 hurricane – but still a hurricane – and then dissipated. But unlike a dissipated hurricane, the pandemic isn't completely gone.

In our daily lives, though, the pandemic feels like it's over, and for some people it feels like it never happened. Other than ongoing vigilance (surveillance and assessment), precautions are in abeyance in most of the world. The most expensive precaution, a new vaccine, wasn't ready until after the 2009 northern and southern hemisphere waves were over or receding. Still, the vaccine could have prevented a lot of morbidity and some mortality if it had been ready sooner. And if the pandemic comes roaring back, many people will wish they had availed themselves of the vaccine they so disdained as the last wave receded.

Today, the only individuals continuing to take pandemic precautions are obsessed, and the only individuals complaining that we should never have taken precautions in the first place are ignorant.

As we write this in late June 2010, there is now a huge gap between WHO's pandemic risk communication and the public's pandemic risk perception. That is, what most people think they just lived through – a mild pandemic that has virtually disappeared – is radically different from what WHO tells them they are living through: a "moderate" pandemic that is still ongoing.

The result: Widespread skepticism about WHO's credibility, and thus widespread receptiveness to previously fringe allegations.

"Widespread" is a relative term here. Most people pay virtually no attention to the World Health Organization. They didn't realize it had a lot of credibility, and they didn't notice when its credibility collapsed. And WHO's most devoted followers – many of them public health professionals – have tended to rally round the organization in its hour of need. (Some of them have supported WHO publicly while muttering to each other that it really should stand down from some of its earlier pronouncements.)

But there's a super-important group in the middle: people who don't follow WHO closely but who do pay enough attention to have learned first that it seemed to be overstating the seriousness of the swine flu pandemic and then that it was accused of doing so on purpose to help Big Pharma make big bucks. That group includes many of the world's opinion leaders: corporate executives, government officials, medical reporters, foundation heads, etc. Losing ground in their eyes matters for WHO, and may continue to matter for decades to come.

The collapse of WHO's credibility is important not just in general because the world needs a credible international health agency, but also, in particular, because WHO's pandemic warnings about the future (though not its status reports about the present) are right on target. H1N1 could mutate into a much deadlier virus. That would be unusual after a year, but not unprecedented. The world could also face another pandemic in the near future, caused by another novel flu virus. There was apparently a flu pandemic in 1830–31 and another in 1833. The 1968 pandemic started less than ten years after the 1957 pandemic ended. And of course all flu-watchers know that the extremely deadly H5N1 bird flu virus is still Out There. If bird flu ever starts transmitting easily from humans to humans, it's a whole new ball game.

It is very hard for WHO to convince people – governments, journalists, ordinary citizens – to take the near-term pandemic risk seriously as long as WHO keeps describing the past year's pandemic experience in ways they simply cannot take seriously.

Report - A7-0035/2011
European Parliament

REPORT on evaluation of the management of H1N1 influenza in 2009-2010 in the EU

Report - A7-0035/2011

European Parliament, 9 February 2011

https://www.europarl.europa.eu/doceo/document/A-7-2011-0035_EN.html

Motion for a European Parliament Resolution

On evaluation of the management of H1N1 influenza in 2009-2010 in the EU (2010/2153(INI))

...

Explanatory Statement

"Unlike the avian virus, H1N1 presently causes mainly mild illness, with few deaths, outside the outbreak in Mexico. We hope this pattern continues." [Margaret Chan, Director-General of the World Health Organization, 18 May 2009]

According to the figures provided by the European Centre for Disease Prevention and Control (ECDC) at the end of April 2010, influenza A(H1N1) 2009 caused 2 900 deaths in Europe. These figures are low in comparison to the official mortality estimates for seasonal influenza, which the Commission put at 40 000 deaths in a moderate year and 220 000 in a particularly severe season. They are also significantly less than the most optimistic forecasts suggested by the health services of the EU Member States.

The moderate severity of H1N1 influenza was officially recognised by the WHO as early as May 2009, at a press conference given by Margaret Chan, the Head of the World Health Organisation (WHO) – which is to say one month prior to the WHO issuing a level-6 'pandemic' alert over H1N1.

Member States and European institutions accepted this maximum-level alert, triggering in some Member States a raft of measures that were very costly (e.g. the costs are put at EUR 1 300 million in Great Britain and EUR 990 million in France - compared to EUR 87 million against seasonal influenza), and in those cases disproportionate to the actual – and known – severity of H1N1 influenza. A majority in the committee stated that it was unforeseeable to predict how the virus would develop.

The rapporteur pointed to the case of Poland, where the government did not proceed to vaccination against H1N1, and where nevertheless the death rate was comparable to those countries which decided to go for national vaccination campaigns.

The WHO should urgently revise its definition to include the severity of a disease into its definitions on the stages of a pandemic to allow for more appropriate responses.

The European Union needs closer cooperation

The committee considered that better cooperation is needed in the response to pandemics. It called for a review of the prevention plans. It also called for a clarification and if necessary review of the roles and responsibilities of key actors, and for reinforced cooperation between Member States and coordination of Member States with ECDC.

It also supported the introduction of a procedure that would enable the Member States to make group purchases on a voluntary basis. The committee made it clear that manufacturers have to bear

full liability for the authorised indications of their products and that this should be fully applied by Member States in all contracts for the procurement of vaccines.

The European Union needs greater independence

According to the rapporteur, the analysis of the management of H1N1 influenza in Europe highlights an underlying problem: a lack of independent evaluation by our national and/or European health authorities, and a resulting failure to adapt the public health measures, as best as possible and in real time, to the actual clinical and epidemiological statistics available. The strategies adopted in the European Union and the Member States derived from preparedness plans drafted in 2005 or 2007, in conjunction with the WHO. In the majority of the Member States, the policies on the purchasing of vaccines had already been laid down in advance purchase agreements signed back in 2007 with pharmaceutical companies. The stock 'pandemic' vaccines given to millions of people in Europe were the subject of an accelerated authorisation procedures, based in fact on studies and vaccine formulae produced at the time of the H5N1 virus, which also dated from the years 2005/2007.

When asked about the safety of the adjuvants in the 'pandemic' vaccines, Zsuzsanna Jakab, former head of the ECDC, responded on 29 September 2009 in a letter to the rapporteur that 'it is true that no vaccine has ever been authorized on so little data, but it is expected that extrapolation can be done from the previous experience with the same adjuvants but with different flu strains'.

With ECDC, the EU has a dedicated agency with regard to the assessment of communicable diseases. ECDC should full apply its competences as an independent agency to assess and communicate the severity of infection risk and be given adequate means for all its tasks.

Various improvements to the accelerated authorisation procedure are needed to allow for a better assessment of vaccines in case of a pandemic.

Financing and upstream choices can play a decisive role in deciding whether a trial is successful or not. That is why there is a need for studies on vaccines and antiviral medications that are independent of the pharmaceutical companies, including as regards monitoring of the vaccination coverage.

The European Union needs greater transparency

The analysis of the EU's management of the H1N1 crisis also highlights another vital issue: that of the evaluation of the medicinal products recommended against influenza, and the way they are being used. The committee agreed that vaccination strategies should rely on three conditions to be successful: that the vaccine is efficacious, that it has a positive risk-benefit balance and that it is targeted to the risk groups. A report providing clarity on the number of vaccines purchased and used in the various Member States and on the disease and its side effects of vaccines and anti-viral treatments should be made by the Commission based on information by Member States. At the same time, an assessment of the influenza vaccination strategies recommended in the EU and applied in Member States against these criteria should be done.

Conflicts of interest immediately lead to suspicions of undue influence. All conflicts of interests need to be avoided. According to the rapporteur, at the very least, declarations of interest of all experts that advise the European public health authorities have to be published.

- having regard to the Workshop held on 5 October 2010 by the European Parliament's Committee on the Environment, Public Health and Food Safety on the Influenza Pandemic A (H1N1) - The response of Member States and the European Union,

- having regard to Rule 48 of its Rules of Procedure,

- having regard to the report of the Committee on the Environment, Public Health and Food Safety (A7- 0035/2011),

A. whereas the national and international health authorities, including the WHO, stated in May 2009 that the H1N1 influenza was at the time causing only mild illness, but that it could not be taken for granted that this pattern would continue,

B. whereas, under the International Health Regulations (IHR) – a legal instrument binding on the states parties to it – the remit of the WHO includes public health surveillance, coordinating international public health measures and, in relation to potentially pandemic viruses, determining current phases of alert on a scale of one to six,

C. whereas the phases of a global pandemic are determined in accordance with the provisions of the IHR and in consultation with other organisations and institutions and with the Member States affected,

D. whereas the criteria for defining a 'pandemic', as revised by the WHO in 2009, are based solely on the spread of the virus while disregarding the severity of the illness caused by it,

E. whereas Member States, the European Commission and external bodies such as the WHO should take into account the virulence of a future influenza outbreak as well as the propagation of the virus when making public health decisions which may affect public health and social policies in Member States,

F. considering the high degree of unforeseeability regarding the pandemic's severity and how it was going to unfold, and the possibility that the pandemic might worsen in Europe, as it did in 1918 and 1968,

G. whereas, on the basis of the WHO pandemic alert and subsequent recommendations, the Member States responded rapidly, in line with the precautionary principle, using what resources they had available to implement public health action plans; whereas the move to the highest level of alert, indicating the presence of a pandemic, gave rise in some cases to public health decisions that were disproportionate,

H. whereas the WHO called an end to the state of alert concerning H1N1 influenza only in August 2010 (statement by the WHO Director-General of 10 August 2010, http://www.who.int/mediacentre/news/statements/2010/h1n1_vpc_20100810/en/print.html

I. whereas, in accordance with the principle of subsidiarity, the preparation for and reaction to health risks in the European Union fall within the competence of the Member States; whereas the Treaty of Lisbon exhorts the Member States to strengthen cooperation, sharing of information and good practices within the framework of the WHO and the existing structures of the EU; whereas stronger coordination measures by the Commission, with the support of the ECDC and the EMEA within the framework of the International Health Regulation, reinforce the effectiveness of national measures,

J. whereas the pharmaceutical industry had to respond to a sudden, pressing and exponential demand for the supply of vaccines by the Member States; whereas the industry had to develop with very great urgency a new vaccine likely to be effective against the virus,

K. whereas the costs arising from the management of this crisis in the Member States were significant and could perhaps have been reduced by better cooperation between the Member States and better coordination between the Member States and ECDC,

L. whereas the expenditure committed by certain Member States to the response plans drawn up relates mainly to the purchase of vast quantities of vaccines and antiviral treatments, and whereas purchasing procedures led to concerns regarding compliance with rules on public procurement and transparency in some Member States,

M. whereas there were significant price disparities among the Member States that had prior purchase agreements for vaccines, based, among other factors, on the differentiated liability conditions of each agreement,

N. whereas lawsuits were taken in various Member States, alleging corruption and conspiracy on the part of civil servants in relation to contracts signed in summer 2009 between ministries of public health and manufacturers of H1N1 influenza vaccines,

O. whereas, according to the Commission the reluctance of vaccine suppliers to bear full product liability may have contributed to reducing citizens' trust in vaccine safety; whereas confidence in vaccines against H1N1 influenza was also undermined by incomplete and contradictory communication on the benefits and risks of vaccination and the potential risks of H1N1 influenza to the public,

P. whereas the differing recommendations made within the EU and the Member States on the subject of the priority groups targeted for vaccination illustrate the significant uncertainties and diverging views surrounding the appropriate response to H1N1 influenza,

Q. whereas pandemic influenza preparedness planning relies to a great extent on vaccination strategies; whereas vaccination strategies should rely on three conditions to be successful: efficacy of the vaccine, a positive benefit-risk balance for the vaccine, and targeting of risk groups,

R. whereas there needs to be transparency about the fulfilment of these conditions,

S. whereas the vaccines' benefit-risk ratio has now been demonstrated in tolerance and immunogenicity studies based on actual use,

T. whereas there is a need for studies on vaccines and antiviral medications that are independent from pharmaceutical companies so as to have a balance between private and publicly funded studies,

U. whereas, in the event of a future influenza pandemic, more work needs to be done to improve the performance of influenza vaccines, especially for high risk groups and against drifted variants,

V. whereas, due to the early acquisition of vaccines and systematic vaccination strategies, especially among the most vulnerable groups, the EU was the best prepared region in the world; whereas, however, considerable differences emerged between the preparedness of EU Member States and the lack of genuine cooperation weakened the EU's overall preparedness,

W. whereas the limited cooperation among Member States, especially the lack of joint public procurement of vaccines, the lack of joint stockpiles, the lack of a solidarity and brokerage mechanism between Member States, and the absence of prior purchase agreements in several Member States were the main factors undermining the EU's better preparedness,

X. whereas despite the repeated requests made by the European Ombudsman to the European Medicines Agency (EMA), the documents held by the EMA relating to research protocols, clinical trials and the undesirable effects of medicinal products submitted to it for assessment are not always accessible to the public,

Y. whereas the information and communication concerning H1N1 influenza in 2009-2010 in the EU have demonstrated the crucial role played by the media in relaying public health precautions and recommendations, but also in emphasising selected aspects of the outbreak and its consequences, thus potentially altering public opinion perceptions and the public authorities' responses,

Cooperation

1. Calls for the prevention plans established in the EU and its Member States for future influenza pandemics to be revised in order to gain in effectiveness and coherence and to make them sufficiently autonomous and flexible to be adapted as swiftly as possible and on a case-by-case basis to the actual risk, based on up-to date relevant information;

2. Requests clarification, and if necessary review, of the roles, duties, remits, limits, relationships and responsibilities of the key actors and structures at EU level for the management of medical threats – the European Commission, the ECDC, the EMA and the Member States, as well as more informal entities such as the Health Security Committee, the HEOF and the 'public health' group, composed of senior officials able to intervene in the decision-making process regarding the management of a health crisis – and calls for that information to be made publicly available;

3. Welcomes the fact that the Commission has committed itself to studying the possibility of a revision and a long-term reinforcement of the legal basis of the Health Security Committee;

4. Requests that special attention be paid to preparation between sectors within the framework of co-operation between Member States on the Health Security Committee;

5. Emphasises the need to reinforce cooperation between Member States, and coordination of Member States with the ECDC, so as to ensure coherent risk management in response to a pandemic in compliance with the International Health Regulation;

6. Calls for the continuation and improvement of cooperation and coordination among Member States, institutions and international and regional organisations, particularly in the early stages of a virus outbreak, in order to determine its severity and make appropriate management decisions;

7. Considers it advisable to reinforce the mandate of the Committee of Public Health, the action and role of which should be improved to provide better support for the Member States in achieving a coherent approach to preparedness for and response to public health threats and emergencies of international concern as defined in the IHR;

8. Urges the WHO to revise the definition of a pandemic, taking into consideration not only its geographical spread but also its severity;

9. Calls on the Member States to involve health professionals more closely at every stage in the preparation and application of strategies for preventing and combating pandemics;

10. Urges the European Union to allocate more resources to research and development regarding preventive measures in the field of public health care while conforming to its stated objective of allocating 3 % of European GDP to R&D; more specifically, calls for an increase in the investments dedicated to a better evaluation and anticipation of the impact of an influenza virus both between pandemics and at the beginning of a pandemic;

11. Calls for continued investment in national epidemiological, serological and virological surveillance centres;

12. Expresses its approval for the introduction of a procedure enabling the Member States to make group purchases of anti-viral vaccines and medicinal products on a voluntary basis, in order to obtain, for a given product, inter alia, equitable access, advantageous rates and flexibility for the order;

13. Recalls that according to current Union legislation on medicinal products, liability for the quality, safety and efficacy concerning the authorised indications of a medicinal product rests with the manufacturer, and calls for full application of this rule by Member States in all contracts for the procurement of vaccines, as an important factor in maintaining/regaining citizens' trust in vaccine safety;

14. Requests, within the framework of the common and responsible management of the supply of vaccines, that consideration be given to the possibility of easing access for developing countries to vaccine products in the event of a pandemic;

Independence

15. Takes the view that the European Centre for Disease Prevention and Control (ECDC) has to exercise its powers as an independent agency to assess and communicate the severity of infection risk and be given adequate means for all its tasks;

16. Invites the ECDC, with input from the WHO, to contribute to reviewing best practice on national influenza preparedness plans, and to make recommendations on best practice in areas such as crisis management techniques, vaccination and communication strategies;

17. Demands that increased vigilance and complete transparency be assured with regard to the evaluation of, and reporting on, medicinal products recommended in the event of health emergencies, and more particularly in genuine pandemic situations;

18. Underscores the need for studies independent of the pharmaceutical companies on vaccines and antiviral medications, including with regard to the monitoring of vaccination coverage;

19. Wishes to ensure that scientific experts have no financial or other interests in the pharmaceutical industry that could affect their impartiality; requests the development of a European code of conduct relating to the exercise of the function of a scientific expert in any European authority in charge of safety and of the management and anticipation of risks; requires that each expert subscribe to the ethical principles of this code of conduct before taking up his or her duties;

20. Asks that experts who are involved in the pharmaceutical sector, while they may be consulted, should be excluded from decision-making;

21. Calls in particular on the European Commission, with the support of the EMA, to improve the accelerated authorisation procedures for the placing on the market of medicinal products designed to respond to a health crisis - *inter alia* by making them suitable for different influenza strains varying levels of severity and differences in target groups - in such a way that proper clinical trials are carried out before a pandemic occurs, in order to ensure a full assessment of the risk-benefit balance associated with the use of those medicinal products for the relevant target groups and to come up with corresponding legislative proposals where necessary;

Transparency

22. Calls for an assessment of the influenza vaccination strategies recommended in the EU and applied in Member States, covering the efficacy of the vaccines, their risk-benefit balance and the different target groups recommended, with a view to safe and effective use;

23. Calls on Member States to report the following information to the Commission before 8 September 2011:

a) on different vaccines and anti-viral treatments, respectively:

(i) the number of doses purchased,

(ii) the total expenditure for the purchase,

(iii) the number of doses actually used,

(iv) the number of doses placed in storage, sent back to the manufacturer and reimbursed, or sold to other Member States or third countries,

b) on the disease and side effects of vaccines and anti-viral treatment, respectively:

(i) the number of H1N1 infections,

(ii) the number of deaths due to H1N1 infections,

(iii) the number and nature of adverse effects reported due to vaccinations or and anti- viral treatment against H1N1,

24. Calls on the Commission, with the support of ECDC and EMA, to make a summary report about the information referred to in paragraph 23, broken down by Member State, before 8 March 2012 and to make it publicly available as an important contribution to the review of the current pandemic influenza preparedness plans;

25. Reminds the EMA of the regulatory requirement to make access available to all the documents relating to clinical trials, research protocols and undesirable effects of the medicinal products evaluated by its experts, including the vaccines and anti-viral drugs recommended as a means of combating H1N1 influenza; welcomes the new rules on access to documents adopted by the EMA in October 2010;

26. Recognises that conflicts of interest among experts who advise European public health authorities lead to suspicions of undue influence and harm the overall credibility of these public health authorities and their recommendations; considers that all conflicts of interest must be avoided;

27. Requests the adoption of a definition common to all European public health authorities of what constitutes a conflict of interest;

28. Calls for such conflicts of interest to be brought to Parliament's attention by means of an internal investigation carried out by the Committee on Budgetary Control with a view to determining whether payments to the aforementioned experts were made in a correct and transparent manner and whether the procedures normally employed by the European institutions to forestall such conflicts of interest were followed;

29. Calls for the declarations of interest of all experts who advise the European public health authorities to be published, including those of members of informal groups;

30. Is aware of the need to communicate risks and benefits more clearly and transparently to the public; underlines the necessity to arrive at a coherent message to the citizens as soon as a health hazard is evaluated; insists on the importance of consistent communication by the Member States regarding the informative contents of the message (e.g. the nature of the virus, the nature of the risk, how best to prevent it and the risks and benefits of prevention and/or treatment);

31. Calls for a global European strategic approach for the so-called 'at-risk' groups on how to reach them and communicate with them in case of pandemics;

32. Calls for the building of relationships of trust with the media concerned with disseminating public health messages; requests the setting-up of a select group of available experts to answer questions from journalists at all times, as well as the availability of a spokesperson;

33. Stresses the need for accountability of information professionals and the prudence required in the processing of health information messages, a fortiori in the context of a pandemic;

34. Expects, in this regard, a more comprehensive collection and rapid submission of coherent data from national health monitoring authorities to competent EU authorities,

35. Considers it essential for the Commission and Member States to swiftly undertake the necessary revisions, including better vaccination and communication strategies, in order to build confidence in public health measures that seek to prepare and prevent pandemics;

36. Instructs its President to forward this resolution to the Council, the Commission, the WHO and national parliaments.

Downgrading the 2009 H1N1 scare

The China Post, 18 December 2009 10:11 am TWN
https://web.archive.org/web/20091221185040/http://www.chinapost.com.tw/commentary/the-china-post/special-to-the-china-post/2009/12/18/237032/Downgrading-the.htm

Berkeley, Calif. – Although the 2009 H1N1 swine flu pandemic appears to have peaked, Dr. Keiji Fukuda, the top flu expert of the World Health Organization (WHO), recently said a third wave could still be ahead. Third wave or not, there is sufficient data since April 2009 to show that this virus is less severe than normal seasonal flu and that efforts to prevent the spread of this pandemic were futile – especially hand-washing, still promoted by the WHO, the U.S. Centers for Disease Control and other national agencies.

According to WHO estimates, recent normal seasonal influenza viruses have killed between 250,000 to 500,000 people a year – about 0.005 percent of the world population. This can be used as a yardstick to compare the severity of past and current influenza pandemics.

The initial fear was that the 2009 H1N1 flu virus might be as deadly as the 1918 "Spanish" H1N1 influenza pandemic that killed an estimated 30 to 50 million people, or about 2.5 percent of the world population. The 1918 influenza pandemic was therefore 500 times as severe as recent seasonal outbreaks. In contrast, the death toll of the 1957 "Asian" H2N2 influenza pandemic was about 14 times, and the 1968 "Hong Kong" H3N2 influenza pandemic about six times more than the death toll of current seasonal influenza viruses.

As of late 2009, the new H1N1 virus has actually killed fewer people overall than recent seasonal influenza viruses, including the 32 so far in Taiwan and 178 in the PRC, although it may be more severe for children. Global transmission of the new H1N1 virus has apparently peaked or is just beginning to peak, and while it is definitely not over, its overall death toll may well end up lower than the death toll of recent seasonal flu viruses.

Initial fears of a repeat of the devastating 1918 influenza pandemic led to an unprecedented public health response, which included expanding the target groups to receive the H1N1 vaccine, travel bans from infected areas, isolating and quarantining suspected infected persons, school closures, canceling or limiting large public gatherings or events and recommending universal hand-washing.

Measures such as isolation or quarantine, school closures and so on were not implemented uniformly, but left to the discretion of national and often local health departments. At best, they may have slowed the spread of this virus in some areas.When I asked Ed Kilbourne, an Emeritus Professor at New York Medical College, who I consider to be the dean of influenza experts, about the effectiveness of hand-washing for preventing influenza transmission, he replied that influenza is transmitted through inhalation, rather than by touching contaminated objects: "Hand-washing does nothing to curtail the spread of influenza, but it may be a good substitute for hand-wringing."

No one opposes the promotion of hand-washing as a good hygienic practice in general, but it has been misleading for public health agencies to claim it is vital for preventing transmission of influenza viruses. Blind adherence to this scientifically unsupported measure threatens to erode the credibility of all public agencies that have aggressively implemented this recommendation. It is bizarre that many government health agencies, including the U.S. Centers for Disease Control, continue to promote it, despite lack of evidence.

It is now clear that the 2009 H1N1 virus is not as deadly as current seasonal influenza viruses, and that public health efforts to contain the spread of this virus were largely wasted. The WHO's graded alert phases for influenza pandemics may imply, but do not take into account, the severity (as measured by deaths) of the pandemic.

The WHO's alert for the 2009 H1N1 pandemic still stands at its top phase 6 which merely denotes "widespread human infections."

Based on the global influenza surveillance data collected, the WHO influenza forecast and advisory for 2010 should say: "The severity of the 2009 H1N1 influenza pandemic virus has been reduced from a potential maximum severity virus to a baseline severity seasonal influenza virus that may cause scattered outbreaks during the 2010 respiratory disease season. All of the additional high-risk populations identified in the 2009 pandemic should receive the 2010 seasonal influenza vaccine, and everyone should continue to wash their hands regularly, even though this practice does not prevent transmission of influenza viruses."

James Chin MD MPH is Clinical Professor of Epidemiology at the School of Public Health, University of California, Berkeley, and former chairperson of the U.S. national Advisory Committee for Immunization Practices (ACIP).

Government wants right to detain sick people

News Com.au, 20 November 2009, 12:01am

https://web.archive.org/web/20091121135534/http://www.news.com.au/adelaidenow/story/0,22606,26375106-2682,00.html

HEALTH authorities want the power to detain people for up to three months if they refuse testing or treatment for infectious diseases.

Under draft legislation proposed by the State Government, someone with swine flu, measles or meningococcal disease could be forcibly held, examined and treated.

It is one of several wide-ranging powers sought to protect the public.

The Public Health Bill also would, for the first time, give authorities the power to override parents who refused treatment for their children with infectious conditions.

Other diseases that could be controlled include AIDS, polio, rabies, salmonella and cholera.

The tougher enforcement powers would come with a substantial increase in fines - up from $60,000 to $1 million and 10 years' jail - and relate to any serious risk caused to public health. SA Health public health director Kevin Buckett said the new legislation would give authorities wider powers to act more quickly.

"There's nowhere on Earth that is more than 36 hours from anywhere else and where people go, bugs can go," he said yesterday.

"We have to have legislation that can respond in that sort of time.

"The idea would be that we get them out of circulation, where they can't infect other people." Dr Buckett said there were many reasons people refused treatment, including mental health issues, language barriers and even malicious behaviour.

Non-communicable diseases, such as cancer and diabetes, could also be declared, allowing the Government to introduce codes of practice for certain industries or the community.

Opposition health spokesman Duncan McFetridge said he supported powers to protect the public from infectious diseases but feared parts of the Bill - to be debated next year - would allow the Government to control people with chronic conditions.

"It's bordering on nanny-state legislation," he said. "It's understandable but how far do we go?"

Australian Medical Association state president Andrew Lavender said he welcomed most of the changes. as important to protect the public.

THE FLU CASE

Lawyers will represent Bachelot at Court Hearing to Stop Swine Flu Vacinations in France

The Flu Case, 21 December 2009, 14:01
https://web.archive.org/web/20100102053438/http://theflucase.com/index.php?option=com_content&view=article&id=2364%3Alawyers-will-represent-bachelot-at-court-hearing-to-stop-swine-flu-vacinations-in-france&catid=41%3Ahighlighted-news&Itemid=105&lang=en

A lawyer will represent the French Health Minister Roselyne Bachelot at a court hearing scheduled for January 4th in Paris on whether the mass swine flu vaccination programme should be suspended.

Bachelot received a summons after legal action was taken by a group led by Dr Marc Vercoutère and Christian Cotten, who argue the vaccine is untested and toxic and poses a danger to the people of France.

The judgement could be given on the same day as the hearing, but most probably it will come a few days later, Christian Cotten said.

He said he expected the hearing to be mostly symbolic in as far as the political and financial interests pushing the swine flu vaccination campaign remain powerful and are advancing the campaign in spite of polls showing that 76 % of the French now have no intention of taking the jab.

The citizen's group hopes to use the occasion to publicise the inadequate basis for the current mass swine flu vaccination campaign by compelling Bachelot and her lawyers to present arguments, evidence and facts to justify their actions.

The mass swine flu vaccination campaign has galvanised France and led to the create of a new alternative or independent networks on the internet as people have become increasingly aware that the government and the mainstream and government-controlled media are not giving adequate information.

Criminal complaints have also been filed in France.

Also, an appeal is due to be launched in Belgium in January against a court ruling that the government did not violate laws by recommending the untested Pandemrix swine flu jab to pregnant women.

This is the press release on Bachelot's summons in French:

Roselyne Bachelot assignée en référé le 4 janvier 2010 au TGI de Paris par Marc Vercoutère/Cri-Vie et Christian Cotten/Politique de Vie

Communiqué de presse - 19 décembre 2009 - Christian Cotten - Marc Vercoutère

Madame Roselyne Bachelot, Ministre de la Santé, a reçu vendredi 11 une assignation à comparaître en référé devant le Tribunal de Grande Instance de Paris le lundi 4 janvier prochain à 9 h, aux fins de mettre un terme dans les plus brefs délais à la campagne de vaccination contre la grippe H1N1.

Lægemiddelstyrelsen giver læge mundkurv på

H1N1-Pandemien er en af århundredets største medicinalskandaler'

Information, 21 December 2009
https://www.information.dk/indland/2009/12/laegemiddelstyrelsen-giver-laege-mundkurv-paa?lst_cntrb

Efter kritiske udtalelser om statens indkøb af Tamiflu, har en læge fra statens Institut for Farmakoterapi (IRF) fået mundkurv på. Det er, fordi indkøb til et influenzaberedskab ligger uden for instituttets område, forklarer lægemiddelstyrelsens direktør.

(Photo) *Det omtalte lægemiddel Tamiflu - som Danmark har købt en million doser af - kan ikke forebygge influenza. Det kan kun forsøge at bremse spredningen af influenzavirus i kroppen. Præparatet har bivirkninger som ligner influenza og kan svække modstandskraften mod den frygtede bakterie som forårsager lungebetændelse. Det har i det hele taget en begrænset klinisk effekt og reducerer sygdomsperioden med ca. en halv dag.*

Efter kritiske udtalelser om statens indkøb af influenzamidlet Tamiflu, må læger fra Institut for Rationel Farmakoterapi (IRF) ikke længere udtale sig til pressen om sagen. Ordren kommer for Lægemiddelstyrelsens direktør, Jytte Lyngvig.

I Informations artikel den 8. december rejste flere eksperter, herunder læge Niels Heebøll-Nielsen fra Institut fra Rationel Farmakoterapi, kritik af den danske stats store indkøb af Tamiflu. Dagbladet Information og British Medical Journal offentliggjorde samtidig en ny og omfattende gennemgang af videnskabelige data for Tamiflu. En undersøgelse, der viste, at Tamiflu har en »meget begrænset effekt« på følgesygdomme ved svineinfluenzaen og højest kan »dæmpe symptomerne én dag«.
I Danmark har vi indkøbt én million doser Tamiflu til en samlet værdi af 65 millioner kroner.

Fornuftigt

Institut for Rationel Farmakoterapi rådgiver om fornuftig brug af medicin, hvilket man umiddelbart skulle tro kvalificerede læge Niels Heebøll-Nielsen til at udtale sig om, at staten har handlet irrationelt og købt for stort ind.

Til Information sagde han blandt andet, at indkøbet bar præg af den panikstemning, der herskede efter SARS-udbruddet:

»Når frygten breder sig, og der opstår en stemning af død og ødelæggelse, så breder der sig også en forventning om, at der bliver gjort noget. Det er forståeligt nok. Og man må jo have troet på, at Tamiflu har en effekt.«

Desuden kritiserede han grundlaget for indkøbet:

»Når man indkøber store mængder medicin, så ville det være godt, hvis man havde vidst mere om, hvad vi fik for pengene. Den viden, viser det sig, har været mangelfuld, hvad angår Tamiflu. Men man må have stolet på, at det var godt nok. Man havde ingen alternativer,« sagde han.

Rationelt

Institut for Rationel Farmakoterapi hører under Lægemiddelstyrelsen, og i Lægemiddelstyrelsen har man slet ingen holdning til håndteringen af nødberedskabet, forklarer direktøren for Lægemiddelstyrelsen, Jytte Lyngvig:

»Lægemiddelstyrelsen har slet ikke noget med det at gøre. Det er Sundhedsstyrelsen, der står for indkøbet,« siger Jytte Lyngvig. Derfor må Niels Heebøll-Nielsen heller ikke udtale sig om pandemiberedskabet i sin egenskab af ansat i på Institut for Rationel Farmakoterapi:

»Han må sige, hvad han vil privat. Men det her er Sundhedsstyrelsens beslutning. Derfor er det kun rimeligt, at det også er dem, der udtaler sig om det.«

- Det er vel meget rart at have eksperter, der kan forholde sig kritisk til det?

»Så må du snakke med læger på hospitalerne.«

- Institut for Rationel Farmakoterapi forholder sig jo generelt kritisk til den måde vi bruger medicin på?

»Ja, men kun i forhold til daglig brug af medicin. Ikke i forhold til en pandemi. Instituttet har ingen rolle i en pandemi. Når han udtaler sig på instituttets vegne, så skal det være inden for det felt, som instituttet beskæftiger sig med. Man lukrerer jo på navnet, og folk bliver måske forvirrede over, at Institut for Rationel Farmakoterapi udtaler sig om det.«

- Han er jo vant til at vurdere, hvad der er fornuftig brug af medicin?

»Nej, for han har aldrig været med til at købe ind til et beredskab. Hvis han vil kritisere Sundhedsstyrelsens indsats, så må han gøre det som privatperson.

- Tror du, han har lyst til det fremover?

»Det ved jeg ikke. Men det tror jeg da, at han har.«

Danish board of pharmaceuticals muzzles a medical doctor
Lægemiddelstyrelsen giver læge mundkurv på

Information, 21 December 2009
https://www.information.dk/indland/2009/12/laegemiddelstyrelsen-giver-laege-mundkurv-paa?lst_cntrb
(translation was taken from the website of Jane Burgermeister – The Flu Case)
https://web.archive.org/web/20100102045906/http://theflucase.com/index.php?option=com_content&view=article&id=2420%3Adanish-board-of-pharmaceuticals-muzzles-a-medical-doctor-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

After critical comments about the danish government's purchase of Tamiflu, a medicial doctor from the government institute for Rationel Pharmacotheraphia (IRT) has been muzzled.

The explanation is that purchases for flu emergencies lies beyond the competences of that institution, explains the director of the danish board of pharmaceuticals.

After critical remarks about the Danish government's purchase of the flu remedy, Tamiflu, medical doctors from the Institute for Rationel Pharmacotheraphia are no longer allowed to talk to the press on this subject.

The order was issued by the director of Danish Board of Pharmaceuticals (Laegemiddelstyrelsen), Jytte Lyngvig.

In a news item in the Danish daily newspaper, Information, on December 8, several experts, among them Niels Heebøll-Nielsen, from the Institute for Rationel Pharmacotherapia critisized the Danish government's purchase of significant quantities of Tamiflu.

Simultanously the daily Information and British Medical Journal published a new and extensive evaluation of scientific data concerning Tamiflu. The study made it clear, that Tamiflu has "a very limited effect" on the sickness accompanying swine flu and at best, might "suppress the symptoms one day".

In Denmark one million doses has been purchased at a cost of 65 million Danish crowns.

Reasonable

The Institute for Rationel Pharmacotheraphia gives advice concerning appropriate use of medicine, which would, so one might think, qualify medical doctor Niels Heebøll-Nielsen to give an opinion as to whether the state has acted irrationally and purchased too much.

To Information, he said among other things that the purchase was characterized by the atmosphere of panic prevailing after the outbreak of SARS:

"When fear arises and an atmosphere of doom and disaster is spreading then at the same time an expectation occurs that something will be done. It is understandable. And they must have believed in Tamiflu having an effect".

Furthermore he criticised the foundation for the purchase:
"When you buy great quantities of medicine, it would be convenient if you knew more about what you get for the money. That knowledge it seems has been insufficient concerning Tamiflu. But they must have trusted that it was efficient. There were no alternatives," he says.

Rationel

The Institute for Rationel Pharmacotherapia belongs to the Board of Pharmaceuticals, and in Board of Pharmaceuticals they don't hold opinions at all concerning the handling of the emergency, explains the director of that institution, Jette Lyngvig.

"The Board of Pharmaceuticals has absolutely nothing to do with this. It is Danish Board of Health who is the purchaser" says Jytte Lyngvig.

Accordingly, Niels Heebøl-Nielsen as an employee of Institute for Rationel Pharmacotheraphia is not allowed to express opinions concerning the pandemic emergency.

"He may say whatever he wants as a private person. But this one is the decision of Danish Board of Health. Therefore it is only reasonable, that it is up to them to comment on this matter."

It would be reassuring to know there are experts who are able to give a critical evalunation?

"Then you will have to speak to medical doctors at the hospitals".

"Is Institute for Rationel Pharmacotheraphia generally allowed to be critical about the way we use medicines?

"Yes but only the daily use of medicine. Not in relation to a pandemic. The institute has no role to play in a pandemic. When he speaks on behalf of the institute, it has to fall inside the limits of the activities of this institute. When one profits by the name, people could get confused because the Institute for Rationel Pharmacotherapia holds an opinion about this matter."

But he usually evaluates what is a proper use of medicine?

"No, for he has never been part of the purchasing for an emergency. If he criticises the efforts of Danish Board of Health, he must do so as a private person".

Do you think he would like to do that in the future?

"I don't know. But I could well image that he would".

THE FLU CASE

WHO gets 81% of Funding from private Corporations
CFR website reveals member states did not want to declare a Pandemic Emergency

The Flu Case, 22 December 2009 10:16
https://web.archive.org/web/20100117085650/http://theflucase.com/index.php?option=com_content&view=article&id=2381:who-gets-81-of-funding-from-private-corporations-cfr-website-reveals-member-states-did-not-want-to-declare-a-pandemic-emergency&catid=41:highlighted-news&Itemid=105&lang=en

The WHO's annual budget for 2010 will be almost $5 billion with 81 % of the funding – or $4 billion – coming from voluntary contributions from pharmaceutical companies, foundations and other donors, according to a WHO draft budget, available on the website of the Rockefeller affiliated think-tank, the Council of Foreign Relations. => Johnson T. The World Health Organization. 10 August 2009 https://web.archive.org/web/20090822113126/http://www.cfr.org/publication/20003/world_health_organization.html

A table on page 13 of the document, which is called "Draft proposed programme budget for 2010-2011", reveals that the proportion of funding that WHO gets from voluntary contributions has been rising steadily from 71% in 2006-2007 to 77.3% in 2008-2009 to 81% in 2010-2011.

Total funding in 2006-2007 was just over US$ 3 billion. Draft proposed programme budget 2010–2011 https://web.archive.org/web/20090801211032/http://www.paho.org/english/gov/cd/cd48-whobpb-e.pdf

WHO appears reluctant to release a copy of its actual annual budget. A WHO employee working in the publications department in Geneva said that it was a "very internal document" and not every one was entitled to see it.

I have emailed the WHO publications department and requested a copy.

The gigantic and growing amounts of funding that WHO receives from pharmaceutical corporations and private foundations is bound to raise questions about the influence that these entities exercised on WHO's declaration of a pandemic level 6 emergency this June.

The CFR website also reveals that "some" delegates of the the World Health Assembly (WHA), which acts as WHO's governing body, did not want to declare a pandemic emergency level 6 over the mild swine flu.

"It took nearly two months of lobbying and a three-day emergency session to get enough members on board for the pandemic declaration," says the CFR website.

It is not clear who was doing the lobbying to persuade WHA members to agree to a pandemic level 6 declaration.

It is not clear whether pharmaceutical company representatives participated in this three-day emergency session.

WHO has refused to give the names of 18 members of a key secret committee that played a key role in the pandemic emergency declaration. Therefore, it is not possible to assess how many have ties to the pharmaceutical industry.

It is, however, known that at least 7 members of a key vaccine advisory board, SAGE, have financial links to pharmaceutical companies, raising fears of conflicts of interest.

Also, dozens of pharmaceutical executives were present allegedly as „observers“ at a meeting of Sage in July.

WHO refused to release the minutes of this meeting, reinforcing the impression that WHO is engaged inc concealing the influential role of pharmaceutical companies in its decision-making process.

Given the substantial contributions for the private sector, it is legitimate to ask whether the pharmaceutical companies and allied foundations leveraged their financial clout to push through a pandemic level 6 declaration over the mild swine flu so ensuring themselves windfall profits from pre negotiated contracts with governments for vaccines.

The CFR website also states the International Health Regulations are "a legally binding policy for infectious diseases for all WHO member countries."

"In 1995, the WHO began revising the International Health Regulations (PDF), a legally binding policy for infectious diseases for all WHO member countries."

This will raise fears of whether private corporations controlling WHO have also gained control of key functions of national governments in the event of a pandemic declaration.

In addition, the CFR says that the „World Bank and International Monetary Fund have a growing influence on population health that outweighs WHO's.“

What kind of an influence do these banks have since they are known for their predatory approach, and for slashing health programmes as a condition of funding?

"The 2005 Global Health Watch report found that "transnational corporations and other global institutions--particularly the World Bank and International Monetary Fund--have a growing influence on population health that outweighs WHO's" and "some of these institutions, the Bank in particular, now operate in direct competition with WHO."

Furthermore, the significant influence of the eugenicist Bill and Melinda Gates Foundation on global health is referred to.

Extracts from the CFR website: => Johnson T. The World Health Organization. 10 August 2009 https://web.archive.org/web/20090822113126/http://www.cfr.org/publication/20003/world_health_organization.html

The WHO's estimated budget (PDF) is $4.9 billion for 2010, more than $1 billion of which is allocated for "partnerships and collaborative arrangements," such as the Global Alliance for Vaccines and Immunizations (GAVI). Another $2.2 billion is targeted at combating HIV/AIDS ($731 million) and infectious diseases ($1.5 billion). Health experts say funding for the organization is inadequate given the WHO's mandate and that a significant portion of the budget is targeted by donors toward particular programs, similar to the earmarking done by the U.S. Congress.

WHA members finance the WHO with dues based on their individual gross domestic products (GDPs). Garrett says this means, in essence, that countries with the greatest health needs have to listen to the countries with the most money. The 2005 Global Health Watch report says the United States, in particular, uses its funding leverage to continually pressure WHO (PDF) "to steer clear of 'macroeconomics' and 'trade issues' that it says are outside its scope, and to avoid such terminology as 'the right to health.'"

Since the organization was created, the number of global health bodies has ballooned, including those within the UN framework like UNAIDS and UNICEF, numerous HIV/AIDS programs, large private entities such as the Bill and Melinda Gates Foundation, and nongovernmental organizations

such as Doctors without Borders. Experts say the rise of these other organizations, especially those with vastly more resources, is testing the WHO's leadership role. "It's chaos," CFR's Garrett says, adding that WHO's job is sometimes akin to "corralling kittens." The 2005 Global Health Watch report found that "transnational corporations and other global institutions--particularly the World Bank and International Monetary Fund--have a growing influence on population health that outweighs WHO's" and "some of these institutions, the Bank in particular, now operate in direct competition with WHO."

The WHO's funding is overshadowed by that of newly emerging organizations, such as the Bill and Melinda Gates Foundation, the Global Fund for AIDS, Tuberculosis, and Malaria, and PEPFAR (the U.S. President's Emergency Fund for AIDS Relief). The Centers for Diseases Control (CDC), for example, has nearly twice the budget (PDF) of the entire WHO. The Gates Foundation's budget for global health (PDF) is around $2 billion per year, about twice the WHO's core budget.

Experts contend that the WHO, challenged though it might be, is still needed. "There is no alternative to the World Health Organization," says the CDC's Scott Dowell. "We all contribute but we will only succeed if the WHO succeeds." A 2008 report from the British parliament points out that the WHO is still extremely influential among middle- and low-income countries, and has an image of being more neutral than U.S.- or British-based organizations. The report suggests WHO's mission statement be revised to specifically give it a mandate of "preparing a strategy for global health governance." Many health experts suggest Geneva should have more control over the WHO's resources for health programs.

First autopsies show pattern of lung injury causing H1N1 deaths

Examiner, 23 December 2009, 7:50 AM

https://web.archive.org/web/20100405113934/http://www.examiner.com/x-14041-Charlotte-Health-and-Happiness-Examiner~y2009m12d23-First-autopsies-show-pattern-of-lung-injury-causing-H1N1-deaths

Researchers from Brazil have performed the first autopsies, finding a pattern associated with H1N1 flu deaths from pneumonia. The findings are hoped to lead clinicians to better management of H1N1 flu and pneumonia by providing clues about the need for antibacterial and antiviral medications to limit lung damage and deaths from the pandemic flu.

"The lack of information on the pathophysiology of this novel disease is a limitation that prevents better clinical management and hinders the development of a therapeutic strategy," said lead author, Thais Mauad, M.D., Ph.D., associate professor of the Department of Pathology at São Paulo University, in Brazil.

The study, due for publication January 1 in the American Journal of Respiratory and Critical Care Medicine, found that 75 percent of 21 patients autopsied who died from H1N1 influenza had underlying medical conditions such as cancer or heart disease. The patients died in São Paulo with confirmed H1N1 infection in July and August, 2009.

One fourth of those autopsied with H1N1 flu had no underlying medical condition. All of the H1N1 patients who died experienced rapid progression of flu symptoms that lead to death, and were between age 39 to 50.

According to Dr. Mauad, body aches and fever were less frequently present in patients who died from rapid progression of respiratory symptoms associated with H1N1 flu. "Most patients with a fatal form of the disease presented with difficulty breathing (dyspnea), with fever and myalgia being less frequently present."

All of the patients who died from H1N1 flu had acute lung injury that followed three distinct patterns. "All patients have a picture of acute lung injury," said Dr. Mauad. "In some patients this is the predominant pattern; in others, acute lung injury is associated with necrotizing bronchiolitis (NB); and in others there is a hemorrhagic pattern." Bronchiolitis is an inflammation of the small airways in the lung. Necrotizing refers to destruction of the lung tissue.

Patients with underlying medical conditions such as heart disease and cancer who died from H1N1 flu were more likely to have a hemorrhagic lung condition. Bacterial co-infections were associated with necrotizing bronchiolitis (NB).

"It is important to bear in mind that patients with underlying medical conditions must be adequately monitored, since they are at greater risk of developing a severe H1N1 infection," said Dr. Mauad. In these patients, H1N1 infection may present as a potential fatal disease, requiring early and prompt intensive care management, including protective ventilation strategies and adequate hemodynamic management. "We found that 38 percent of these patients had a bacterial infection (bronchopneumonia). This has important consequences because these patients need to receive antibiotic therapy, in addition to antiviral therapy."

Cytokine storm was also found to play a role in deaths from H1N1 influenza. Cytokine storm leading to H1N1 flu deaths is the result of an overly vigorous inflammatory response that causes acute lung injury.

The scientists say the first autopsies uncovering distinct patterns of infection from H1N1 flu in the lungs should lay some groundwork for a better understanding of the disease. "We would like to deepen our efforts into the understanding of the immune responses in cases of severe infection," said Dr. Mauad. "This could ultimately lead to new therapeutic approaches".

Lung pathology in fatal novel human influenza A (H1N1) infection

Am J Respir Crit Care Med. 2010 Jan 1;181(1):72-9.
doi: 10.1164/rccm.200909-1420OC. Epub 2009 Oct 29. PMID: 19875682.
https://pubmed.ncbi.nlm.nih.gov/19875682/

Abstract

Rationale: There are no reports of the systemic human pathology of the novel swine H1N1 influenza (S-OIV) infection.

Objectives: The autopsy findings of 21 Brazilian patients with confirmed S-OIV infection are presented. These patients died in the winter of the southern hemisphere 2009 pandemic, with acute respiratory failure.

Methods: Lung tissue was submitted to virologic and bacteriologic analysis with real-time reverse transcriptase polymerase chain reaction and electron microscopy. Expression of toll-like receptor (TLR)-3, IFN-gamma, tumor necrosis factor-alpha, CD8(+) T cells and granzyme B(+) cells in the lungs was investigated by immunohistochemistry.

Measurements and main results: Patients were aged from 1 to 68 years (72% between 30 and 59 yr) and 12 were male. Sixteen patients had preexisting medical conditions. Diffuse alveolar damage was present in 20 individuals. In six patients, diffuse alveolar damage was associated with necrotizing bronchiolitis and in five with extensive hemorrhage. There was also a cytopathic effect in the bronchial and alveolar epithelial cells, as well as necrosis, epithelial hyperplasia, and squamous metaplasia of the large airways. There was marked expression of TLR-3 and IFN-gamma and a large number of CD8(+) T cells and granzyme B(+) cells within the lung tissue. Changes in other organs were mainly secondary to multiple organ failure.

Conclusions: Autopsies have shown that the main pathological changes associated with S-OIV infection are localized to the lungs, where three distinct histological patterns can be identified. We also show evidence of ongoing pulmonary aberrant immune response. Our results reinforce the usefulness of autopsy in increasing the understanding of the novel human influenza A (H1N1) infection.

NOS

Epidemie Mexicaanse griep voorbij
Mexican flu epidemic over

Nederlandse Omroep Stichting (NOS), 24 December 2009, 13:51
https://web.archive.org/web/20091226165729/https://nos.nl/artikel/124994-epidemie-mexicaanse-griep-voorbij.html

De epidemie van de Mexicaanse griep is volgens het RIVM voorbij. Op dit moment hebben 41 op de 100.000 mensen griepverschijnselen. Daarmee is er geen sprake meer van een epidemie, want de grens daarvoor is 51 op de 100.000 mensen.

Het RIVM baseert zich op cijfers van huisartsen in het hele land. Nederland is tien weken in de greep van de Mexicaanse griep geweest. Een griepepidemie duurt meestal zo lang.

Overleden

Sinds de uitbraak van de Mexicaanse griep zijn 51 mensen eraan overleden. In de meeste gevallen waren ze al ziek.

Dat de epidemie voorbij is, betekent niet dat het virus dat de Mexicaanse griep veroorzaakt, helemaal het land uit is. Nog altijd raken mensen besmet met de griep, er is alleen geen sprake meer van een epidemie.

THE IRISH TIMES

Swine flu rate falls but high among under-5s

The Irish Times, 24 December 2009, 00:00
https://www.irishtimes.com/news/swine-flu-rate-falls-but-high-among-under-5s-1.795086

Rates of swine flu infection in the Republic continued to decline over the past week, according to latest figures from the Department of Health.

In a statement yesterday, it said the rate of influenza-like illness in the population dropped to 42.4 cases per 100,000 population over the past week, down from a rate of 51.3 per 100,000 a week earlier.

That is the equivalent of about 2,000 people succumbing to the virus over the past week, down from about 30,000 cases a week in early November.

Rates of infection among children under 5 remain high, at 113.7 cases per 100,000. In school-going children aged 5 to 14, rates of infection stand at 36 cases per 100,000.

No additional deaths from swine flu have been reported in the past week. The total number of deaths from the H1N1 virus in the State to date stands at 22.

The Department of Health stressed that because the rate of infection in children under 5 is significantly higher than that in the rest of the population, it was important to vaccinate them.

The HSE said the vaccination programme in schools will resume after the Christmas holidays.

Over-65s are also being invited to get vaccinated at mass vaccination clinics, as are families of babies under six months, to protect such babies who are too young to be vaccinated. A plan to roll out vaccinations to the rest of the population will be unveiled in January.

The Irish Medicines Board said yesterday 883 reports of adverse reactions to the vaccine had been reported to it. No serious unexpected safety issues had arisen.

A two-year-old child became the latest victim of swine flu in Northern Ireland, it was announced yesterday.

THE FLU CASE

Barry Donegan

How the Swine Flu boondoggle reinforces the need for separation of Science and State

The Flu Case, 24 December 2009
https://web.archive.org/web/20100102030445/http://theflucase.com/index.php?option=com_content&view=article&id=2404%3Awhy-science-and-the-state-need-to-be-kept-separate-for-the-swine-flu-by-barry-donegan-&catid=1%3Alatest-news&Itemid=64&lang=en

Before we begin, one can already hear the rumble of well-intentioned and college educated non-scientists crying out to title this a Flat Earth piece. However, this text is motivated by a desire to see the flourishing of scientific advancement. There is nothing more repugnant to the free exchange of ideas than the manipulation of the legislative process. What is even worse than that is the effect of appointed bureaucracies upon the same.

To begin, science is the pursuit of new ways to see the world. It is not intended to be a belief system about the way the world works. That would be a religion. The way most modern people consider science is much closer to that of a religion. They believe that there are a broad set of points of consensus found by academia, and that these beliefs are scientific truths. This could be the most unscientific line of thinking possible, and it is the closest thing we have to an attitude of true Flat Earth-ery.

World governments and world government itself believe that the legislative process can give science a little "leg up." They do this through Research and Development. The U.S. Government attempted to solve a scientific health problem during the Swine Flu outbreak. In an attempt to improve the health of the people, the legislative process managed to badly distort the traditional mechanisms that allow science to solve these problems for us.

Swine Flu was touted as a global pandemic. The World Health Organization attributed doom-like categories of description to this serious-but-manageable disease. Since political rhetoric of the day prefers fear to other techniques, it was important for rhetoreticians to describe the Swine Flu in terms of a global killer. This was done to motivate research grants for a few connected companies. This is typical of the corporatist government that we have.

Vaccines are touted as "proven safe" despite the fact that insurance companies will not provide liability coverage for individuals that are harmed by a vaccine. That is the free market's way of telling you that vaccines are actually not very safe. There is a variety of data on different views about the effectiveness of vaccines. Regardless of the data, giving Baxter pharmaceuticals the ability to create a rushed vaccine without any liability for wrongful death does not a process for the creation of a healthy vaccine make. So it came to pass that many became sick due to the Swine Flu vaccine. People that did not take the vaccine were not in the level of jeopardy that the corporate Old Media promised. The disease came and went. It was just another ordinary seasonal flu. It had some different demographic data points, but the mortality figures were comparable to other seasonal flus.

Essentially, the legislative process failed us in this case. We spent tons of money creating an unhealthy pharmaceutical product that was not properly tested. We attempted to give this to everyone, and ran out. The "scientific consensus" accepted by the state was motivated by providing money for pharmaceutical companies. It failed at the task of improving public health and at a fiscally irresponsible cost.

Humanity, science, and the medical industry had the tools to deal with the Swine Flu already. The government did not help prevent any damage. We must remember that the U.S. Congress is populated by individuals who tend to run for office on populist anger. They do not have any special ability to determine the scientific capability of various individuals that they appoint. They are also not usually medical experts and are not especially qualified to make decisions about global pandemics.

The scientific community has the ability to solve problems for us. However, we do not need to distort these truths through grant funding, regulation, and data manipulation. Over time, the truth will win out in application. The best scientific tactics will generate funding after the fact when they are turned into technologies that consumers and businesses use. This is a time-tested tactic. History does not provide plenty of examples of governments helping science flourish. In fact, quite the opposite, it records a long history of boondoggles like the Swine Flu. The most popular example of Flat Earth-ery was the Flat Earth belief itself... which was very much accepted by the governments of the time and instrumental in creating global policy.

THE FLU CASE

Jane Burgermeister

The Media: Pandemics and Power

BBC5 TV // The Flu Case, 28 December 2009, 10:10
https://web.archive.org/web/20100102041622/http://theflucase.com/index.php?option=com_content&view=article&id=2423%3Athe-media-pandemics-and-power-by-jane-burgermeister&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Jane Burgermeister talks of the mainstream media's role in shaping the public perception of a flu pandemic that is designed to promote an elitist agenda of mass vaccination and centralisation of power.

Jane Burgermeister was born in Switzerland of an Irish mother and an Austrian father. She is a dual Irish/Austrian national and lives in Vienna, Austria.

With an MA Honours degree from Edinburgh University, Scotland, she has written for Nature, the British Medical Journal, The Scientist, Reuters Health, and The Guardian among other publications.

She was European Correspondent for the website of Renewable Energy World, a position from which she was suddenly dismissed in July 2009 after filing a series of criminal charges against Baxter, WHO and others alleging bioterrorism with the intent to commit mass murder.

The focus of the action is an episode in February 2009 when Baxter's Austrian subsidiary distributed 72 kilos of vaccine material contaminated with live bird flu virus to sixteen laboratories, a case now being investigated by the Austrian police after criminal charges were filed in April 8th in Vienna.

More charges were filed with the FBI (US embassy, Vienna) in June.

Canadian doctor Ghislaine Lanctot – who has written a book, The Medical Mafia´– supported these charges against the WHO, the UN, and several high ranking government and corporate officials.

StN.DE STUTTGARTER NACHRICHTEN

Wolfgang Molitor

Schweinegrippe aufgebauscht

Stuttgarter Nachrichten, 28 Oktobre 2009, 19:32 Uhr
https://web.archive.org/web/20100102022735/http://www.stuttgarter-nachrichten.de/stn/page/detail.php/2331609

Berlin - Transparency International hat wegen der Schweinegrippe-Impfung schwere Vorwürfe gegen die Pharmaindustrie erhoben. Die Krankheit sei "katastrophenmäßig aufgebauscht" worden.

Kommentar Ihre Meinung ist gefragt

Die Grippe habe sich als "Papiertiger entpuppt", sagte Anke Martiny, Vorstandsmitglied der Anti-Korruptions-Organisation. Sie äußerte den Verdacht, "dass es im Wesentlichen den Anbietern der Impfstoffe genützt hat". Zudem kritisierte sie die Verbindungen von Mitgliedern der Ständigen Impfkommission (Stiko), die die Schweinegrippe-Impfung empfohlen hat, zu Pharmaherstellern. Im konkreten Fall "hätte von der Stiko der Nachweis erbracht werden müssen, dass Interessenkonflikte keine Rolle spielten", so die frühere SPD-Abgeordnete. Die Bundesregierung bestätigte, dass sie afrikanische Länder bei der Bekämpfung der Schweinegrippe mit 14 Millionen Euro unterstützt.

Millionen Krankenversicherten drohen unterdessen die ersten Zusatzbeiträge. Im Jahresverlauf müssen wohl immer mehr die acht oder mehr Euro im Monat zahlen. Es könnte sogar noch teurer werden, sollte der Staat angesichts der ab 2011 greifenden Schuldenbremse den Geldhahn drosseln. Trotz eines einmalig um 3,9 Milliarden erhöhten Zuschusses fehlen den Kassen 2010 fast vier Milliarden Euro. "Wir wissen nicht, ab wann die Zusatzbeiträge in welchem Umfang genau kommen - dass sie kommen, ist aber gewiss", so Kassenverbandschefin Doris Pfeiffer. Finanzminister Wolfgang Schäuble (CDU) kündigte am Sonntag mittelfristig die Reduzierung der Steuerfinanzierung für das Gesundheitswesen an.

Auch ein mögliches Aus der Praxisgebühr wird laut AOK Baden-Württemberg die Patienten finanziell nicht entlasten. Vorstandschef Rolf Hoberg: "Man muss genau hinschauen, ob im Geschenk nicht die bittere Pille der Leistungseinschränkung eingepackt ist." Bundesgesundheitsminister Philipp Rösler (FDP) stellte am Sonntag klar, dass die Praxisgebühr nicht ersatzlos abgeschafft werden soll. Im Koalitionsvertrag sei lediglich vereinbart, dass die Lenkungswirkung der Praxisgebühr überprüft wird.

German corruption Watch Dog criticises Big Pharma over Swine Flu

The Flu Case, 28 December 2009, 11:56
https://web.archive.org/web/20100102005512/http://theflucase.com/index.php?option=com_content&view=article&id=2417%3Agerman-corruption-watch-dog-criticises-big-pharma-over-swine-flu&catid=1%3Alatest-news&Itemid=64&lang=en

Transparency International, a corruption watch dog based in Germany, has criticised the mass swine flu vaccination campaign for being "blown up to a catastrophe" in order to serve the interests of pharmaceutical companies.

Anke Martiny, former SPD MP, said the swine flu had turned out to be a "paper tiger." She criticised the links between the members of Germany’s permanent vaccine commission (Stiko) and pharmaceutical companies. Stiko "should have given proof that there was no conflict of interests," she said.

In the meantime, millions of Germans are facing a rise in their contributions for indebted medical insurance of eight euros or more in 2010, in part to pay for the billion-euro swine flu campaign.

L'OBS

L'OMS ne veut pas crier victoire avant 2011

L'OBS, 29 December 2009, à 17h54
https://web.archive.org/web/20160205063338/http://tempsreel.nouvelobs.com/la-grippe-a/20091229.OBS2023/l-oms-ne-veut-pas-crier-victoire-avant-2011.html

"Il est trop tôt pour affirmer que l'on a passé le pic de la pandémie de grippe A au niveau mondial", estime Margaret Chan, directrice générale de l'OMS.

La pandémie de grippe A (H1N1) pourrait ne pas être vaincue avant 2011, estime Margaret Chan, directrice générale de l'Organisation mondiale de la santé (OMS), dans un entretien publié mardi 29 décembre par le journal Le Temps.

"Sur la base de mon expérience avec les nouvelles maladies et des leçons tirées des pandémies passées, je pense qu'il faut rester prudent et observer l'évolution de la pandémie au cours des six à douze prochains mois avant de crier victoire", dit-elle au quotidien suisse.

"Il est trop tôt pour affirmer que l'on a passé le pic de la pandémie de grippe A au niveau mondial. Mais, il est vrai que dans certains pays de l'hémisphère nord comme le Canada ou les Etats-Unis, on a passé le pic de la deuxième vague de la pandémie. Mais tous les pays n'en sont pas là. L'hiver est encore long."

"Pas prêts" pour la grippe aviaire

Interrogée sur une éventuelle pandémie de grippe aviaire, due au virus H5N1, dont le taux de mortalité est beaucoup plus élevé, la directrice de l'OMS juge que les autorités sanitaires n'y sont pas préparées.

"Je le dis sans hésitation: nous ne sommes pas prêts du tout. Je souhaite vraiment que le monde n'ait jamais à affronter une pandémie de grippe aviaire", dit-elle.

Près de 12.000 décès dus à la grippe A et confirmés par des analyses ont été recensés dans le monde, précise Margaret Chan, ajoutant que l'étendue réelle du bilan ne pourra être évaluée avant deux ans, "quand tous les pays appliqueront la même méthodologie pour mesurer la hausse de la mortalité".

The Himalayan
T I M E S

WHO chief yet to be vaccinated against swine flu

The Himalayan, AFP, 30 December 2009, 11:33 pm
https://thehimalayantimes.com/news-archives/who-chief-yet-to-be-vaccinated-against-swine-flu

Geneva: World Health Organization chief Margaret Chan revealed Tuesday that she has yet to be vaccinated against the swine flu virus, which has killed over 11,500 people world-wide.

"I have asked my medical service to enquire where I can go to get my vaccination," she told reporters in Geneva, pointing out that she has just returned from leave.

The WHO director-general stressed that she would "of course" get vaccinated and that "many of my staff" at the WHO have already taken their jabs against the A(H1N1) virus.

Many countries rolled out their vaccination programmes over the past two months, but the take-up rate has been lower than expected.

Germany said in early December it wants to sell spare vaccines to other countries, while Switzerland said in mid-December that it would give away part of its stock to developing countries and sell another part to countries that are still trying to procure vaccines.

A/H1N1 pandemic not over yet, warns WHO chief

CCTV, 30 December 2009, 07:58 BJT
http://english.cctv.com/20091230/100866.shtml

Geneva, Dec. 29 (Xinhua) - The head of the World Health Organization (WHO) warned on Tuesday that the A/H1N1 pandemic influenza is not over yet and the world needs to continue monitoring the evolution of the disease in 2010.

"It's too premature, too early for us to say we have come to an end of the pandemic influenza worldwide," Dr Margaret Chan told a news conference at the WHO headquarters in Geneva.

It's true that many countries in the northern hemisphere have passed the peak of the pandemic, notably in the United States, Canada and parts of Europe, but on the other hand there are still intensive influenza activities in countries like Egypt and India, Chan said.

The current pandemic caused by the H1N1 flu virus has been described as "moderate", but scientists cannot rule out the possibility that the virus could mutate and become more dangerous given the fact that flu virus are highly unpredictable.

So "it would be prudent and appropriate for the WHO together with our members' states to continue to monitor the evolution of this pandemic for the next six to 12 months," Chan said.

So far nearly 12,000 people worldwide have been killed by the A/H1N1 influenza since the disease first emerged in April, according to an update released by the WHO last week.

But Chan noted that was a laboratory confirmed number, and it actually underestimates the real number of deaths caused by the pandemic.

"Many countries don't have the capacity for surveillance, for diagnosis and for confirmation. So there would be some deaths in some countries that are not reported," Chan said.

According to the WHO chief, the handling of the A/H1N1 pandemic has shown that the world is much better prepared now than five years ago to deal with such diseases. But there are still many gaps in the health systems in many countries.

She warned that the world is not yet ready for dealing with a pandemic caused by the H5N1 bird flu virus, which is "much more toxic and deadly" than the H1N1 virus.

"I just wish that the world does not have to deal with a pandemic ignited by a much more toxic and deadly virus, the avian flu virus H5N1," Chan said.

the WHITE HOUSE
PRESIDENT BARACK OBAMA

Barack Obama

Establishing Federal capability for the timely provision of Medical Countermeasures following a Biological Attack

The White House, Executive Order 13527, 30 December 2009.
https://obamawhitehouse.archives.gov/the-press-office/executive-order-medical-countermeasures-following-a-biological-attack

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered as follows:

Section 1. Policy. It is the policy of the United States to plan and prepare for the timely provision of medical countermeasures to the American people in the event of a biological attack in the United States through a rapid Federal response in coordination with State, local, territorial, and tribal governments.

This policy would seek to:

(1) mitigate illness and prevent death;

(2) sustain critical infrastructure; and

(3) complement and supplement State, local, territorial, and tribal government medical countermeasure distribution capacity.

Section 2. United States Postal Service Delivery of Medical Countermeasures. (a) The U.S. Postal Service has the capacity for rapid residential delivery of medical countermeasures for self administration across all communities in the United States. The Federal Government shall pursue a national U.S. Postal Service medical countermeasures dispensing model to respond to a large-scale biological attack.

(b) The Secretaries of Health and Human Services and Homeland Security, in coordination with the U.S. Postal Service, within 180 days of the date of this order, shall establish a national U.S. Postal Service medical countermeasures dispensing model for U.S. cities to respond to a large-scale biological attack, with anthrax as the primary threat consideration.

(c) In support of the national U.S. Postal Service model, the Secretaries of Homeland Security, Health and Human Services, and Defense, and the Attorney General, in coordination with the U.S. Postal Service, and in consultation with State and local public health, emergency management, and law enforcement officials, within 180 days of the date of this order, shall develop an accompanying plan for supplementing local law enforcement personnel, as necessary and appropriate, with local Federal law enforcement, as well as other appropriate personnel, to escort U.S. Postal workers delivering medical countermeasures.

Section 3. Federal Rapid Response.

(a) The Federal Government must develop the capacity to anticipate and immediately supplement the capabilities of affected jurisdictions to rapidly distribute medical countermeasures following a biological attack. Implementation of a Federal strategy to rapidly dispense medical countermeasures requires establishment of a Federal rapid response capability.

(b) The Secretaries of Homeland Security and Health and Human Services, in coordination with the Secretary of Defense, within 90 days of the date of this order, shall develop a concept of operations and establish requirements for a Federal rapid response to dispense medical countermeasures to an affected population following a large-scale biological attack.

Section 4. Continuity of Operations.

(a) The Federal Government must establish mechanisms for the provision of medical countermeasures to personnel performing missionessential functions to ensure that mission-essential functions of Federal agencies continue to be performed following a biological attack.

(b) The Secretaries of Health and Human Services and Homeland Security, within 180 days of the date of this order, shall develop a plan for the provision of medical countermeasures to ensure that mission-essential functions of executive branch departments and agencies continue to be performed following a large-scale biological attack.

Sec. 5. General Provisions.

(a) Nothing in this order shall be construed to impair or otherwise affect:

(i) authority granted by law to a department or agency, or the head thereof; or

(ii) functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity, by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

Household transmission of 2009 pandemic influenza A (H1N1) virus in the United States

N Engl J Med. 31 December 2009; 361(27):2619-27
doi: 10.1056/NEJMoa0905498. PMID: 20042753; PMCID: PMC3840270.

Abstract

Background: As of June 11, 2009, a total of 17,855 probable or confirmed cases of 2009 pandemic influenza A (H1N1) had been reported in the United States. Risk factors for transmission remain largely uncharacterized. We characterize the risk factors and describe the transmission of the virus within households.

Methods: Probable and confirmed cases of infection with the 2009 H1N1 virus in the United States were reported to the Centers for Disease Control and Prevention with the use of a standardized case form. We investigated transmission of infection in 216 households-including 216 index patients and their 600 household contacts--in which the index patient was the first case patient and complete information on symptoms and age was available for all household members.

Results: An acute respiratory illness developed in 78 of 600 household contacts (13%). In 156 households (72% of the 216 households), an acute respiratory illness developed in none of the household contacts; in 46 households (21%), illness developed in one contact; and in 14 households (6%), illness developed in more than one contact. The proportion of household contacts in whom acute respiratory illness developed decreased with the size of the household, from 28% in two-member households to 9% in six-member households. Household contacts 18 years of age or younger were twice as susceptible as those 19 to 50 years of age (relative susceptibility, 1.96; Bayesian 95% credible interval, 1.05 to 3.78; P=0.005), and household contacts older than 50 years of age were less susceptible than those who were 19 to 50 years of age (relative susceptibility, 0.17; 95% credible interval, 0.02 to 0.92; P=0.03). Infectivity did not vary with age. The mean time between the onset of symptoms in a case patient and the onset of symptoms in the household contacts infected by that patient was 2.6 days (95% credible interval, 2.2 to 3.5).

Conclusions: The transmissibility of the 2009 H1N1 influenza virus in households is lower than that seen in past pandemics. Most transmissions occur soon before or after the onset of symptoms in a case patient.

Garlic prices soar in China amid flu fears

USA Today, 31 December 2009, 01:01 am
https://web.archive.org/web/20100117142042/http://www.usatoday.com/NEWS/usaedition/2009-12-31-garliccraze31_ST_U.htm?csp=34

Beijing – Wrapped up in earmuffs and a heavy jacket to fight the Beijing winter, Liu Zhan shows little sign of soaring wealth. Until he removes his gloves — and reveals a large gold ring. At the Chinese capital's biggest vegetable wholesale market, other traders call him "Millionaire Liu."

The pungent root of that nickname is stacked in bags on and around Liu's haulage truck. Garlic prices have jumped so high in China that the crop has outperformed gold and stocks to be the country's best performing asset this year.

As H1N1 swine flu continues to worry China's leaders – who are rolling out a nationwide vaccine program – its people seek a more traditional remedy. Just as some Chinese turned to turnips to prevent the SARS virus in 2003, garlic has emerged as a swine flu fighter in 2009.

"Garlic kills bacteria, and I eat at least half a bulb each day," says Liu, 43, whose prices have leapt from just five cents a pound in February to almost 55 cents today.

Although Chinese government experts have cautioned consumers about the lack of scientific proof for garlic's flu-killing powers, its supporters remain adamant. "Garlic can definitely help prevent swine flu," claims Li Jingfeng, chairman of the Jinxiang Garlic Association in eastern China's Shandong province.

Self-promoted as China's "hometown of garlic," Jinxiang county grows a quarter of all garlic in China, which in turn provides more than a quarter of global output, says Wang Hao, marketing manager for the China Garlic website. Jinxiang, whose name means Gold Village, has enjoyed its best-ever sales year, says Li.

"Next year, the price will be even higher, but our American and European buyers still think it's cheap, as garlic sells for $6.60 for a pound in their countries," he says.

A windfall for U.S. producers

The Chinese price hike has been a boon to U.S. garlic producers, says Bill Christopher, owner of Christopher Ranch in Gilroy, Calif., the largest U.S. garlic producer.

"There's a lot less Chinese garlic being shipped over here, and what is being shipped is being shipped at prices three times more than last year," Christopher says. "There's a bit of a world shortage and of course that raises the price."

Chinese garlic usually accounts for 90% of the U.S. import market, which supplies more than half of the bulbs consumed in the nation, Christopher says. This year, the Chinese have shipped about half the usual 200 million pounds of garlic, and the price has tripled since last year, from about $8 to $24 for a 30-pound box. For U.S. producers, whose higher quality bulbs sell for $40 to $50 a box and are marketed to restaurant chefs, prices have risen 15% to 20%, he says.

The cost of U.S. garlic rises every year, in part because of ongoing water shortages in California, "but (this year) that's more than going to be offset by increases in the sale price due to the Chinese not shipping as much garlic," Christopher says.

H1N1 only partly explains the garlic fever, Li says. Rising prices in 2006 sparked a rush to plant garlic that created a market glut over the next two years. Falling acreage and bad weather combined to leave suppliers in the driver's seat this year, he says.

The real winners appear to be speculators such as Shao Mingqing, a jobless 22-year-old who borrowed money to buy 100 tons of garlic in September, then made a $59,000 profit selling in October, the state-run *China Daily* reports. He now drives a $26,360 Toyota, it says.

The volatile nature of the garlic market is typical of a cyclical product, says Chen Shuwei, an analyst at Beijing Orient Agribusiness Consultants. "There is a lot of money in China, but private businessmen don't have many avenues for investment as state-owned companies control many large industries. But it's easy for them to enter a sector like garlic and make some short-term profits.

"Their money may head to another product soon," he warns.

While Beijing closely watches potential bubbles in key industries such as real estate, the pricey bulb remains a minor concern, Chen says.

"The price of garlic is rising, and Chinese people need it for their daily cooking, but the rise does not have a big impact on household consumption, and matters less than key crops like corn and wheat," he says.

Sticker shock

The soaring costs still raise eyebrows on China's streets. "How can it be this expensive?" asks Zhao Wenjing, a Beijing nurse buying garlic Monday. "I haven't cooked for a long time, but I heard some doctors said it could prevent H1N1, so I came to buy some, although I don't actually like the smell," says Zhao, 26.

Unlike some Chinese business booms, the garlic surge might help American businesses, at least in the short term. Garlic growers in the USA have long complained about their Chinese competition.

"Chinese garlic's major price bump is a boon for California growers looking to recoup business that has been lost to cheaper Chinese garlic," reads a blog post on the site of a major California grower.

CCTV.com

A/H1N1 pandemic death toll rises to 12,220, says WHO

CCTV, 31 December 2009, 08:18 BJT
http://english.cctv.com/20091231/101007.shtml

Geneva, Dec. 30 (Xinhua) – The global death toll of the A/H1N1 pandemic influenza has risen to at least 12,220, an increase of over 700 in a week, the World Health Organization (WHO) said in a weekly update on Wednesday.

The death toll in the Americas remains at some 6,670, with no new deaths reported in the past week. But more deaths were recorded in all the other five regions, notably in Europe and the Western Pacific, the UN agency said.

According to the WHO's tally, A/H1N1 pandemic deaths in Europe increased more than 300 from a week ago, reaching at least 2,422, while the number of deaths in the Western Pacific rose to 1,249, from 1,030 last week.

The pandemic death numbers in South-East Asia, East Mediterranean and Affica increased to 1,056, 693 and 130 respectively.

The reported number of fatal cases is an under representation of the actual numbers as many deaths are never tested or recognized as influenza related, the WHO has noted.

The H1N1 flu virus was first identified in North America in April, and the WHO declared the new influenza as a pandemic in June. So far the virus has caused infections in more than 208 countries and overseas territories or communities.

WHO Director-General Dr Margaret Chan warned on Tuesday that the A/H1N1 pandemic influenza is not over yet and the world needs to continue monitoring the evolution of the disease in 2010.

Although the pandemic has passed its peak in many countries in the northern hemisphere, notably in the United States, Canada and parts of Europe, but "it's too premature, too early for us to say we have come to an end of the pandemic influenza worldwide," Chan told a press conference in Geneva.

She said the WHO and its members states should continue to monitor the evolution of this pandemic for the next six to 12 months, given the fact that flu viruses change constantly and the current "moderate" pandemic could become more fatal.

U.S. Reaction to Swine Flu: Apt and Lucky

The New York Times, 1 January 2010
https://www.nytimes.com/2010/01/02/health/02flu.html

Although it is too early to write the obituary for swine flu, medical experts, already assessing how the first pandemic in 40 years has been handled, have found that while luck played a part, a series of rapid but conservative decisions by federal officials worked out better than many had dared hope.

The outbreak highlighted many national weaknesses: old, slow vaccine technology; too much reliance on foreign vaccine factories; some major hospitals pushed to their limits by a relatively mild epidemic.

But even given those drawbacks, “we did a lot of things right,” concluded Dr. Andrew T. Pavia, chairman of the pandemic flu task force of the Infectious Diseases Society of America.

Federal officials deserve “at least a B-plus,” said Dr. William Schaffner, chairman of preventive medicine at Vanderbilt University’s medical school.

Even Dr. Peter Palese, a leading virologist at Mount Sinai Medical School, who can be a harsh critic of public policies he disagrees with, called the government’s overall response “excellent.”

About 10,000 people had died by mid-November, the Centers for Disease Control and Prevention estimated; the pandemic seems unlikely to reach even the lower end of a forecast of 30,000 to 90,000 deaths made in August by the President’s Council of Advisers on Science and Technology.

The virus and the vaccine cooperated. While the former proved highly transmissible in children, it was only rarely lethal, remained susceptible to drugs and has not thus far mutated into an unpredictable monster. Vaccine supply was a problem, but one small dose was enough. (By contrast, an experimental avian flu vaccine protected people only when it was six times as strong.)

For that reason, the relatively cautious decisions by the nation’s medical leadership contained the pandemic with minimal disruption to the economy.

For example, in the early days, they ignored advice to close the Mexican border and pre-emptively shut school systems. They released part of the national Tamiflu stockpile, but did not give it to millions of healthy people prophylactically, as Britain did. They ordered vaccine made with a 50-year-old egg technology rather than experimental methods. They bought adjuvants – chemical “boosters” – that could have stretched the first 25 million vaccine doses into 100 million, but did not use them for fear of triggering a backlash among Americans made nervous by the messages of the antivaccine movement.

To alert the public without alarming it, a stream of officials – from doctors in the navy blue and scrambled-eggs gold of the Public Health Service to a somber President Obama in the White House – offered updates, at least twice a week for months.

It is now clear that this is the least lethal modern pandemic. The flu appears to kill about one of every 2,000 people who get it, American researchers say. (British researchers found half that death rate.) By contrast, the Spanish flu of 1918 killed about 50 of every 2,000, and the 1957 and 1968 pandemics killed about 4 of every 2,000.

The flu has reached more than 200 countries and is still peaking in places like Eastern Europe and Russia. Even though there was no vaccine yet, it killed fewer than expected during the Southern Hemisphere's winter, June through August.

Officials in the United States conceded that some mistakes were made.

For example, they could have spotted the new virus earlier if there had been better cooperation with Mexico. In late April, the United States isolated it in samples from Texas and California just as Canadian officials were testing Mexican ones. The outbreak probably began in rural Mexico in January, but was spotted only when thousands fell ill in late March or early April in Mexico City.

The C.D.C. tests viruses in Southeast Asia, where new flus are usually born. "This time," said Dr. Thomas R. Frieden, the C.D.C. director, "one happened to emerge in a place where we don't have a surveillance system."

Also, the government predicted in early summer that it would have 160 million vaccine doses by late October. It ended up with less than 30 million, leading to a public outcry and Congressional investigations.

"Imagine if they'd managed the expectations better," said Michael T. Osterholm, director of the Center for Infectious Disease Research and Policy at the University of Minnesota. "If they'd said, 'We won't have any till December,' and had some in October, they would have looked like heroes."

Robin Robinson, chief of vaccine purchasing for the Department of Health and Human Services, was the most overly optimistic. In an interview, Dr. Robinson said he had actually tried to be conservative, assuming that manufacturers would get 1.4 doses per egg, when they typically got two or more.

Until the eggs could be tested in August, "we didn't know that we had one of the poorest-producing viruses in the last 50 years," he said. Good batches had 0.6 doses per egg, he said, bad ones had 0.2.
If he had it to do over again, he said, "I'd factor in the worst-case scenario – which was 2009."

Another controversial decision – sending a few early vaccine doses to Wall Street firms like Goldman Sachs and Citibank – was more of a bad public relations move than a bad public health one, experts said. That choice was made by the New York City Health Department, "and we made the decision not to second-guess local health authorities," Kathleen Sebelius, secretary of health and human services, said in an interview.

The government allotted vaccine to states based on population size. Some local health officials had thousands line up in parking lots for shots, some sent teams into schools and some relied on private doctors.

Distribution of the vaccine could have been focused more precisely, experts said, directing it to hospitals first, or to doctors treating children and pregnant women, or to cities with big outbreaks.
"I still think sending it out on a per capita basis was the fairest and most equitable way," Ms. Sebelius said.

The early combination of fears about the vaccine and anger over shortages, said Dr. Paul Offit, chief of infectious diseases at Children Hospital of Philadelphia, reminded him of an old Borscht Belt joke: "The food at this resort is so terrible," one patron complains. "Yes," agrees her companion. "And such small portions!"

One real triumph, several experts said, was how little damage misinformation did. In 1976, many people refused shots after three elderly Pittsburgh residents died shortly after getting theirs; it took the C.D.C. five days to explain that it was just a coincidence.

This time, many rumors arose but were quickly debunked: That thousands had died in Mexico. That the virus had circulated in the Midwest for a decade, undetected. That it had escaped from a laboratory. That seasonal flu shots made catching swine flu more likely. That flu shots did not work or caused autism. That the administration would make them mandatory. That Tamiflu resistance was widespread in Northern California. That a flu shot had disabled a Washington Redskins cheerleader, or that she was cured by chelation therapy by a doctor associated with the antivaccine movement. That mutant killer flu strains were circulating in Argentina or Ukraine or North Carolina.

The debunking succeeded, Dr. Osterholm said, “despite the fact that there are many fewer reporters who understand medical issues than there used to be.”

This time, both the C.D.C. and the World Health Organization responded quickly to almost every rumor. At the epidemic’s height, they held several news conferences a week, taking questions by phone from all over the world.

They also invited dozens of reporters to daylong seminars on influenza at C.D.C. headquarters in Atlanta and to exercises around the country led by the former anchorman Forrest Sawyer, at which they debated, for example, whether a miscarriage by one woman after getting a flu shot was a big scoop or a nonstory.

Remaining to be seen is what effect the pandemic has had on Americans’ feelings about vaccines.

Dr. Frieden said he thought a victory over the antivaccine movement had been scored. Nearly 60 million people have been vaccinated, including many pregnant women and children, with no surge in side effects.

John P. Moore, an AIDS researcher at Weill Cornell Medical College, was less sure. Dr. Moore, who spent years fighting AIDS denialism, has called skepticism about flu vaccine “an unholy alliance of the left and right” because it joined the liberal natural-medicine proponents with anti-big-government conservatives.

“It’s hard to say if it hurt or helped,” Dr. Moore said, pointing out that polls still show a large minority of Americans rejecting the vaccine. “As with AIDS, people have to die before others understand the consequences of ignoring science-based medicine.”

THE FLU CASE

January 2010 opens with Barrage of Media Hype over Swine Flu Pandemic

The Flu Case, 1 January 2010, 19:05
https://web.archive.org/web/20100102051810/http://theflucase.com/index.php?option=com_content&view=article&id=2440%3January-2010-opens-with-barrage-of-media-hype-over-swine-flu-pandemic&catid=41%3Ahighlighted-news&Itemid=105&lang=en

There have been only 201 cases of swine flu confirmed in laboratories in the German city of Celle according to the Cellesche Zeitung, and yet the newspaper is claiming there is a pandemic raging.

http://www.cellesche-zeitung.de/index.php/cz/Inhalt/Aktuelles/Region/Stadt-Celle/Celler-Arzt-stellt-unrechtmaessige-Rechnung-aus - deleted

"Every one wants to be vaccinated as quickly as possible against the swine flu jab," proclaims the Lower Saxony newspaper in its January 1st, 2010 edition, heralding yet another year of media swine flu hype.

201 lab confirmed cases of swine flu mean that less than 0.3 % of the people are infected with the mild swine flu disease in Celle, which has a population of more than 71,000 people according to Wikipedia.

This fact underlines that the swine flu pandemic is a media event in the sense that there are almost no laboratory-confirmed cases and very few deaths.

Morever most of the cases of swine flu are mild, milder even than the seasonal flu.

By any standards, this is no pandemic

The low incidence rate means there is no pandemic even according to WHO's relaxed definition.

The corporate media has blown the story out of proportion by focusing on the few deaths attributed to the swine flu and by saturating society with “expert opinions”, “government statistics” and images of sick of children in hospital beds; patients on respirators, pigs in the mud.

The French government has found a means of pumping up the figures of people infected with swine flu without the need to provide data.

The French Health Surveillance Institute (INVS) released has just published its "estimate that 13 to 24 per cent of people in FRance or between 7.9 and 14.8 million people have been infected in France so far.

The number assumes about 30 percent of all infected people did not show symptoms, making it even simpler for the INVS to justify the acceleration of the country's mass swine flu vaccination campaign announced on December 31st by the French Interior Minister.

http://www.invs.sante.fr/surveillance/grippe_dossier/docs_professionnels/estimation_cas_graves_grippe_a_h1n1_171209.pdf

This make the swine flu appear omnipresent in France in spite of the fact there is negligible danger in reality.

The swine flu needs to be understood as consciously crafted media event concocted by the corporate media, the pharmaceutical companies, WHO and governments to get people to take the untested vaccine.

And there is no sign that 2010 will bring any relief from this horror. On the contrary, the New Year has opened with yet more media hype, and government massaging of data and downright fraud.

THE EUROPEAN UNION TIMES

Obama Orders US Government to begin Preparing for Biological Attack

The European Union Times, 2 January 2010
https://web.archive.org/web/20100104174832/http://www.eutimes.net/2010/01/obama-orders-us-government-to-begin-preparing-for-biological-attack/

The US Post Office could play a key role in distributing medical aid in the event of a biological attack, according to an executive order released by the White House.

The order signed by President Barack Obama directs government agencies, local law enforcement and the US Post Office to work on a model for distribution of medical countermeasures in the wake of a biological attack.

"This policy would seek to:
(1) mitigate illness and prevent death;
(2) sustain critical infrastructure; and
(3) complement and supplement State, local, territorial, and tribal government medical countermeasure distribution capacity," the order said.

"The US Postal Service has the capacity for rapid residential delivery of medical countermeasures for self administration across all communities in the United States," the order added.

The US Health and Human Services Secretary Kathleen Sebelius and Homeland Security Secretary Janet Napolitano were instructed to work with the post office to develop a "dispensing model for US cities to respond to a large-scale biological attack, with anthrax as the primary threat consideration."

The order calls for the model to be drawn up within 180 days, but gives no details as to whether the idea of using the US postal system to assist Americans in the wake of a biological attack is a new one.

The United States has sought to bolster its capacity to respond to biological attacks since 2001, when anthrax-laced letters mailed to people across the United States led to five deaths.

The order came amid heightened security concerns here following an attempt to bring down a US-bound jetliner on Christmas Day. A 23-year-old Nigerian has been charged in the case.

Irish Independent

Swine flu death rate here one of highest in Europe

Irish Independent, 2 January 2010
https://www.independent.ie/irish-news/swine-flu-death-rate-here-one-of-highest-in-europe/26619373.html

The death toll here from swine flu is disproportionately high compared with other European states.

A total of 22 people have died here as a result of the virus, putting Ireland 12th in Europe for fatalities. In contrast, the Netherlands, with a population of more than 16.5 million people, has had just 52 deaths.

A table, covering 29 countries, was released by the the European Centre for Disease Prevention and Control.

It sets out the number of reported deaths up to Christmas Eve from the pandemic virus that caused a worldwide alert last year.

It comes as the Department of Health has reported no new deaths from swine flu in the Republic over Christmas, during which time the spread of the disease fell significantly, affecting 1,034 people compared with more than 2,000 the previous week.

Lethal

However, although the trends are reassuring, the latest European report reveals how the virus, although mild for most sufferers, has been lethal for at least 832 people. It has claimed the most lives in Britain (156), followed by France (150), Germany (123), the Netherlands (52) and Greece (49).

During Christmas, 149 Irish people remained hospitalised with swine flu and 10 of these were seriously ill in intensive care.

According to the European report, Bulgaria continues to have a high intensity of swine flu along with Greece.

Ireland is categorised as having medium intensity, while countries seeing relatively low spread of the virus include Britain, Belgium, the Netherlands and Cyprus.

The age groups who most needed to be hospitalised with the virus in the Republic so far have been children under 15 years of age followed by people under 24 years of age. The lowest rate has been among people over 65. About 42pc of those who were hospitalised had pre-existing conditions such as chronic heart disease, liver disease, kidney disease, asthma and diabetes.

The rate of swine flu illness has been highest in the west and south of the country, while the midlands has seen the lowest level of swine flu infections.

Up to last Sunday, the rate of infection among the 0-4 years of age group also fell to 27.6 per 100,000 compared with 113.7 per 100,000 for the previous week. The rate among the 5-14 years of age group also halved to 19.2 per 100,000.

The closure of schools and creches due to the holiday season was expected to be one of the factors leading to the drop among young children and teenagers. The department stressed, however, that the rates among children under five years of age were still relatively high.

"Children in this age group are more at risk of being hospitalised from flu complications and the department and the Health Service Executive would urge all parents to arrange to have their children under five vaccinated as soon as possible," a spokesman said.

"The vaccine programme through schools will resume after the holidays. Babies aged under six months cannot get the swine flu vaccine, but we will offer a vaccine to everyone living with a child under six months to protect the baby. Appointments can be made for a vaccination clinic on www.swineflu.ie or by contacting the HSE Information Line on 1850 24 1850."

The Irish Medicines Board said that up to last Wednesday, 907 reports of suspected adverse reactions to the swine flu vaccine were received.

The reports received remained consistent with the expected pattern of adverse effects for the pandemic vaccines. The benefits versus the risks of both vaccines remained positive, said the spokesman.

China reports 648 deaths from A/H1N1 flu

CCTV, 3 January 2010, 08:13 BJT
http://english.cctv.com/20100103/100837.shtml

Beijing, Jan. 2 (Xinhua) – The Chinese mainland reported 648 deaths from the A/H1N1 influenza as of Dec. 31, the Ministry of Health said on Saturday.

More than 120,000 A/H1N1 flu cases were reported up to the last day of 2009, 110,000 cases of which had recovered, the ministry said.

A/H1N1 accounted for 85.9 percent of flu cases, a minor drop from November, it said.

The ministry said there were fewer cases of large outbreak in schools of major cities such as Beijing and Shanghai last month, but the epidemic still spread in the countryside and urban communities.

There was also a drop in the weekly reported number of new cases but the number of serious cases and deaths, especially those of chronic patients, obese people and pregnant women, increased sharply, it said.

As of Dec. 31, more than 49.9 million people nationwide had been inoculated against the A/H1N1 flu, it said, adding about 12 people for every 100,000 were suspected of having adverse reaction related to the vaccine, similar to data from the World Health Organization.

The ministry said last month that China would face increasing pressure of flu control in the next two months due to nationwide flow of large population during the New Year and Spring Festival holidays.

YAHOO! ACTUALITÉS FRANCE

Grippe A: Bachelot change de stratégie.

Yahoo, Fr., 5 janvier 2010, 20h19
https://web.archive.org/web/20100110130439/http://fr.news.yahoo.com/63/20100105/tpl-grippe-a-bachelot-change-de-stratgie-5cc6428.html#ynw-article-part2

En replis ces derniers jours, l'épidémie de grippe A semble bel et bien s'être transformée en crise politique. Depuis l'annonce de la revente de vaccins à l'étranger, les critiques ont monté d'un cran à l'encontre d'une campagne de vaccination qualifiée de "fiasco", "scandaleux échec", "faute stratégique lourde", rapporte Le Monde.

Conséquence: le gouvernement semble vouloir changer de stratégie. La preuve par quatre.

1. La commande 50 millions de doses de vaccins est résiliée

Ces doses, "ni livrées ni payées", représenteraient une économie de plus de 350 millions d'euros, a annoncé la ministre de la Santé lundi sur TF1.

Plusieur dose du vaccin contre la grippe A

2. Une nouvelle vague de vaccination débute

Dans les collèges et lycées. La première a rencontré un très faible succès avec moins de 9% des élèves vaccinés. Cette fois, le personnel des établissements pourra bénéficier des bons soins des médecins et infirmières scolaires, note 20minutes.fr.

Dans les entreprises. "Celles qui le souhaitent pourront en effet procéder de manière autonome à la vaccination de leurs salariés, voire à celle de leur famille", explique 20minutes.fr.

3. Finalement, les généralistes peuvent vacciner dans leurs cabinets

Dès la semaine prochaine. On peut dire que la ministre a pris les médecins libéraux de court. Ces derniers attendent de savoir dans quelles conditions cette vaccination aura lieu, écrit TF1. Et surtout qui en supportera le coût.

Après avoir refusé, depuis le début de la campagne de vaccination, que les généralistes aient le droit de vacciner à leur cabinet, Roselyne Bachelot a fait volte-face: "Nous pouvons maintenant les associer à la campagne de vaccination car la donne logistique a changé", s'est justifiée Roselyne Bachelot sur RTL.

4. Bientôt une commission d'enquête parlementaire?

Est-ce une désaveux du gouvernement pour sa propore politique? C'est ce que sous-entend le parti socialiste.

"[Avec l'annonce] du non achat de 50 millions de doses non produites et le recours possible aux généralistes, Roselyne Bachelot désavoue sa propre politique", a remarqué la secrétaire nationale à la Santé et à la sécurité sociale du Parti socialiste, Marisol Touraine, selon Europe 1.

En tous cas, la ministre de la Santé s'est dit prête à accepter une commission d'enquête parlementaire sur le sujet.

"Je viens régulièrement devant l'Assemblée nationale et le Sénat rendre compte du déroulement de la campagne de vaccination, cela ne me gêne absolument pas, au contraire", a-t-elle assuré sur RTL.

Bientôt une enquête parlementaire sur le sujet comme le réclament le PS et le Modem?

Roselyne Bachelot hier au Tribunal: C'est parti!

Francoise Blanche, 5 Janvier 2010
https://web.archive.org/web/20100110063922/http://francoiseblanche.hautetfort.com/archive/2010/01/05/roselyne-bachelot-hier-au-tribunal-c-est-parti.html

Hier matin, lundi 4 janvier 2010, Roselyne Bachelot était officiellement entendue par les juges... Pour tenter de se défendre face à une plainte pour «empoisonnement à grande échelle»

Pourtant les médias se sont tus, et c'est bien pour ça que je vous informe de ce que j'en sais.

En tout cas, je ne sais pas quand... Mais je peux vous affirmer que si vous habitez Pau , Toulouse et Bordeaux, l'information sortira sur vos antennes locales de France 3. Des journalistes de cette chaîne, connue pour être normalement au service de la population, ont travaillé pour rien puisque leurs reportages ne seront pas diffusés

Pour les autres villes, rien n'est prévu...

C'est la nouvelle éthique des médias ça ! Pour l'instant, ils ont une feuille de route transmise par leur patron et ils veulent nous imposer de penser à la revente des vaccins. Un petit scandale financier, ou bien le débat sur l'identité nationale bien relancé nous occuperont à raisonner sur autre chose qu'à l'affaire «Bachelot l'empoisonneuse»

En communication, ça s'appelle la stratégie du hareng rouge. On vous brandit un truc devant le nez en faisant plein de bruit pour fixer votre attention ailleurs que sur ce qui fâche. Une spécialité de Sarkozy.

C'est le coup de la cape du torero quoi, pour placer sa banderille...

Mais revenons au tribunal.

Donc, hier matin notre commerciale en spécialités pharmaceutiques nationale était assignée en référé devant les juges.

Le tribunal a fait son travail... d'audition. Et puis a reporté sa réponse au 25 janvier... C'est tout ! Enfin presque...

J'espère que les juges vont aller jusqu'au bout sans prétexter qu'ils sont incompétents sur le plan médical.

Ce serait grave que je système judiciaire français s'estime incompétent pour répondre avec partialité dans une telle affaire. Si c'était le cas, ça voudrait dire que les juges ne peuvent traiter que des divorces, des accidents de scooters, ou des broutilles du genre... Ou suivre, eux aussi, les feuilles de route transmises par le gouvernement.

Bref ! ça a duré 1 h 22. Chacun a pu s'exprimer, Roselyne portait une veste tailleur beige et s'était moins maquillée que d'habitude. Du coup, on voyait qu'elle était mal à l'aise et qu'elle n'avait pas fermé l'œil de la nuit. Une sale tête quoi. Elle a bafouillé deux ou trois fois et a été obligée de s'éclaircir souvent la voix tant elle avait du mal à sortir ses arguments.

J'attends des informations plus précises d'une personne qui a assisté à l'audition et qui voudra bien m'informer davantage.

21 jours pour que le gouvernement trouve le moyen de s'en sortir en nous envoyant des «infos polémiques» pour nous occuper à autre chose. ... 21 jours, le temps d'une révolution...

Around 150 people are believed to have caught swine flu in Dumfries and Galloway last week

Daily Record, 6 January 2010
https://www.dailyrecord.co.uk/news/local-news/around-150-people-believed-caught-2597671

Health officials revealed that rising numbers of people are contacting their GP with flu-like illnesses.

Health Protection Scotland said consultation rates showed 117 people per 100,000 population contacted their GP with the swine flu bug.

But when they included those people who did not see their doctor, they estimated the total H1N1 infection rate to be much higher. Across Scotland the number of people believed to have caught the bug rose by almost 15 per cent.

It is estimated 7,240 people across the country caught the infection in the seven day period: a 14.7 per cent increase on the previous week's total of 6,310.

A spokesman from NHS Dumfries and Galloway said: "Anyone who thinks they have influenza A (H1N1) should stay at home and call their GP practice or call NHS 24 on 08454 242424 if it is outwith normal hours.

"They will give you advice and arrange for you to see a health professional if required."

However Health Secretary Nicola Sturgeon said the number of people infected tended to fluctuate from week to week but that the number of cases has generally been in decline.

She said: "Although this week's figures show a slight increase in the estimated number of people having contracted H1N1, this is not statistically significant as numbers have a tendency to fluctuate from week to week. Nor is it evidence that the pandemic is entering a new phase. The overall trend over the past nine weeks has been a continued decline."

She added: "*The figures are a reminder of the importance of vaccination*. *I would encourage all those who have been invited for vaccination to come forward*. As the programme enters its second phase, with children under five being offered the jag, we should see a further decline in the number of cases."

People are being reminded to follow good hygiene practices to protect themselves and others against flu. These will help to slow the spread of the virus.

The Official Word to all, get a Swine Flu Vaccination now

The New York Times, 7 January 2010
https://www.nytimes.com/2010/01/08/health/policy/08flu.html

Citing mistakes made in the 1957 flu pandemic, federal officials on Thursday urged hesitant Americans to get vaccinated now against swine flu to prevent any possibility of another wave of illness and deaths.

Vaccine is now plentiful across the country, and most states are encouraging people of all ages to get shots, said Dr. Anne Schuchat, director of immunization and respiratory disease for the Centers for Disease Control and Prevention. When supplies were short, most states tried to limit the vaccine to children, pregnant women and others at higher risk.

In 1957, Dr. Schuchat said, officials “gave the all-clear whistle” in midwinter and did not encourage flu shots, which were then rarer and also less purified. As a result, she said, there was another substantial wave of deaths in March 1958.

But she conceded that no pandemic was identical to any other. The death rate from swine or H1N1 flu appears to be about a quarter of that of the 1957 flu, but that may be because of antiviral drugs and better ventilators, not the virus itself.

Flu activity across the country is far below its late-October peak, but still higher than normal for this time in most years. It is almost all still swine flu; almost no seasonal flu has been found, and Dr. Schuchat urged doctors to send more samples to state laboratories.

Pneumonia and flu deaths ticked up slightly, which officials were “really keeping our eye on,” she said. The percentage of doctor visits that involved flu symptoms also rose, but that is normal during Christmas vacation because few people schedule routine checkups. There is no way to know if the unusually cold weather has played a part, she said.

The disease centers’ “best guess” is that 60 million people have been vaccinated. There are now 136 million doses available from many sources, including city clinics, schools, private doctors and pharmacy chains.

The Official Word to All, Get a Swine Flu Vaccination Now

By Donald G. McNeil Jr.
Jan. 7, 2010

the **WHITE HOUSE**
PRESIDENT BARACK OBAMA

Presidential Proclamation:
National Influenza Vaccination Week

White House, 9 January 2010
https://obamawhitehouse.archives.gov/the-press-office/presidential-proclamation-national-influenza-vaccination-week

Since the first United States cases were identified in April of last year, our Nation has witnessed the worldwide spread of the H1N1 influenza virus. To date, tens of millions of Americans have contracted this virus. While the vast majority of those affected have recovered without incident, an unusually high proportion of children and younger adults have developed serious complications, resulting in hospitalization or even death. We know that influenza vaccination is the best way to protect ourselves against the flu, and my Administration moved swiftly to respond to this threat by assisting in the development of a vaccine, which is now widely available and has shown to be both safe and effective.

Every American has a role to play in fighting the H1N1 flu. Expectant mothers, children, young adults, and all those under the age of 65 with chronic health conditions are at high risk for H1N1 flu-related complications and should get the vaccine as soon as possible. Those not at high risk can protect themselves and prevent the virus from spreading to more vulnerable members of their families and communities by getting vaccinated as well.

This week presents a window of opportunity for us to prevent a possible third wave of H1N1 flu in the United States. I strongly encourage those who have not yet received the H1N1 flu vaccine to do so. Visit flu.gov to find vaccination sites in communities across our country and to stay informed. Together, we can all fight the H1N1 flu and help protect our families, friends, and neighbors.

Now, Therefore, I, Barack Obama, President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, do hereby proclaim the week of January 10-16, 2010, as National Influenza Vaccination Week.

I encourage all Americans to observe this week by getting the H1N1 flu vaccine if they have not yet done so, and by asking their families, friends, and co-workers to do the same.

In Witness Whereof, I have hereunto set my hand this eighth day of January, in the year of our Lord two thousand ten, and of the Independence of the United States of America the two hundred and thirty-fourth.

Opinion: H1N1 swine flu is not gone;
Obama declares a special week for vaccinations, now in ample supply

Los Angeles Times, 11 January 2010, 5:44.
https://www.latimes.com/archives/blogs/top-of-the-ticket/story/2010-01-11/opinion-h1n1-swine-flu-is-not-gone-obama-declares-a-special-week-for-vaccinations-now-in-ample-supply

And you thought this was just another ordinary winter Monday.

Nearing the end of his first year's reign, President Obama has issued a presidential proclamation declaring this entire week as National Influenza Vaccination Week, inviting all Americans who have not already done so to take a needle in the arm or a dose up the nose. (See full text below.)

Polls earlier in the fall, when the vaccine was in short supply, indicated many Americans had no intention of getting the vaccine, amid rumors over lack of testing and fears of unanticipated side effects. Those adverse side effects have not materialized. But neither has a rush for the vaccine, now in ample supply. (Obama waited on getting his until just before the family's holiday trip to Hawaii.)

An uptick in reported cases of H1N1 swine flu the week after Christmas, when millions returned to work, raised concerns about widespread complacency leading to a renewed wave of the sometimes deadly illness this winter.

With that concern and an abundance of the vaccine on hand (an estimated 136 million doses now), officials at the Centers for Disease Control and Prevention are urging even seniors to get the vaccine. Because of their lifelong exposure to more flu strains, seniors were believed less likely to catch H1N1 and many postponed immunizations when supplies were scarce.

"We think it's time now for seniors," said one senior CDC officer. So, apparently, does the president, with his influenza-week proclamation and invitation.

And you know what happens to people who don't follow the invitation rules at the White House?

They get into the big parties.

Canada Free Press
...Because without America there is no Free World

American Republic replaced by "Council of Governors"?

Canada Free Press, 12 January 2010
https://web.archive.org/web/20101021051613/http://www.canadafreepress.com/index.php/article/18890

Quietly – even stealthily – in the opening days of the New Year, President Barack Obama has set up a "Council of Governors".

Like the 30-plus czars running America with neither the people's nor the congress's blessings, the Council of Governors is already a done deal.

"Is this a first step towards Martial Law, or a tie to the InterPol, RAND National Police Force stuff we've been hearing about," asked a Texas patriot who tipped off Canada Free Press (CFP) after finding news of the new Council of Governors on Twitter. "Is this a sort of Homeland Security Politburo?

"I do know it's another sleuth order executed without any announcement, OR EXPLANATION to the People."

Patriots know by now that the promised Obama "transparency" is a fog.

Checking the Net on the Council of Governors, CFP found other than a few blogs only UPI.com had the story as of this morning:

"President Barack Obama Monday *established a panel of state governors to collaborate with Washington on a variety of potential emergencies*, the White House said." (UPI.com, Jan. 11, 2010 at 11:54 p.m.). "Obama signed an executive order establishing a panel to be known as the Council of Governors, which will be made up of 10 state governors, to be selected by the president to serve two-year terms. Members will review matters involving the National Guard; homeland defense; civil support; and synchronization and integration of state and federal military activities in the United States, the White House said in a statement.

"The statement said the White House would seek input from governors and governors' association (sic) in deciding which governors to appoint to the council, which will have no more than five governors from the same party.

"The secretaries of defense and homeland security will also sit on the council, as will presidential assistants for homeland security and counter-terrorism, intergovernmental affairs, the U.S. Northern Command commander, the commander of the East Coast Guard, and the chief of the National Guard Bureau.

"The panel was set up under a provision of the Fiscal Year 2008 National Defense Authorization Act, the White House said."

There was no timestamp on the latest Emergency Order from Whitehouse.gov, which readers can see below.

The Obama administration seems to be conducting the business of America under cover of the dark.

Executive Order Establishment of the Council of Governors

By the authority vested in me as President by the Constitution and the laws of the United States of America,including section 1822 of the National Defense Authorization Act of 2008 (Public Law 110-181), and in order to strengthen further the partnership between the Federal Government and State governments to protect our Nation and its people and property, it is hereby ordered as follows:

Section 1. Council of Governors.

(a) There is established a Council of Governors (Council).The Council shall consist of 10 State Governors appointed by the President (Members), of whom no more than five shall be of the same political party. The term of service for each Member appointed to serve on the Council shall be 2 years, but a Member may be reappointed for additional terms.

(b) The President shall designate two Members, who shall not be members of the same political party, to serve as Co-Chairs of the Council.

Sec. 2. Functions. The Council shall meet at the call of the Secretary of Defense or the Co-Chairs of the Council to exchange views, information, or advice with the Secretary of Defense; the Secretary of Homeland Security; the Assistant to the President for Homeland Security and Counter-terrorism; the Assistant to the President for Intergovernmental Affairs and Public Engagement; the Assistant Secretary of Defense for Homeland Defense and Americas' Security Affairs; the Commander, United States Northern Command; the Chief, National Guard Bureau; the Commandant of the Coast Guard; and other appropriate officials of the Department of Homeland Security and the Department of Defense, and appropriate officials of other executive departments or agencies as may be designated by the Secretary of Defense or the Secretary of Homeland Security.Such views, information, or advice shall concern:

(a) matters involving the National Guard of the various States;

(b) homeland defense;

(c) civil support;

(d) synchronization and integration of State and Federal military activities in the United States; and

(e) other matters of mutual interest pertaining to National Guard, homeland defense, and civil support activities.

Sec. 3. Administration.

(a) The Secretary of Defense shall designate an Executive Director to coordinate the work of the Council.

(b) Members shall serve without compensation for their work on the Council. However, Members shall be allowed travel expenses, including per diem in lieu of subsistence, as authorized by law.

(c) Upon the joint request of the Co-Chairs of the Council, the Secretary of Defense shall, to the extent permitted by law and subject to the availability of appropriations, provide the Council with administrative support,assignment or detail of personnel, and information as may be necessary for the performance of the Council's functions.

(d) The Council may establish subcommittees of the Council. These subcommittees shall consist exclusively of Members of the Council and any designated employees of a Member with authority to act on the Member's behalf, as appropriate to aid the Council in carrying out its functions under this order.

(e) The Council may establish a charter that is consistent with the terms of this order to refine further its purpose,scope, and objectives and to allocate duties, as appropriate,among members.

Sec. 4. Definitions. As used in this order:

(a) the term "State" has the meaning provided in paragraph (15) of section 2 of the Homeland Security Act of 2002(6 U.S.C. 101(15)); and

(b) the term "Governor" has the meaning provided in paragraph (5) of section 102 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act (42 U.S.C. 5122(5)).

Sec. 5. General Provisions.

(a) Nothing in this order shall be construed to impair or otherwise affect:

- (1) the authority granted by law to a department, agency, or the head thereof; or
- (2) functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

Barack Obama, The White House,January 11, 2010.

LA DÉPÊCHE

Grippe H1N1: entendue par les députés, Roselyne Bachelot répond aux critiques

12 January 2010, 16:53
https://www.ladepeche.fr/article/2010/01/12/753997-grippe-h1n1-entendue-deputes-roselyne-bachelot-repond-critiques.html

La ministre de la Santé Roselyne Bachelot a répondu avec véhémence mardi soir aux critiques sur sa gestion de la pandémie de grippe H1N1 en justifiant devant les députés les décisions prises, et a impliqué dans la vaccination non seulement les médecins libéraux mais les pharmaciens.

Une trentaine de députés étaient rassemblés à l'initiative de la commission des affaires sociales pour une audition ouverte à tous les députés, à la suite des demandes pressantes des socialistes d'une mission d'information parlementaire, et de députés du Nouveau Centre d'une commission d'enquête parlementaire.

La ministre a assuré qu'elle n'était pas hostile à une mission d'information, qui ressemblerait, selon elle, à ses séances d'information devant les membres de la commission des affaires sociales. Pierre Méhaignerie, président de la commission, a indiqué qu'il y aurait mission d'information ou commission d'enquête.

Résiliation de commandes de vaccins, revente des excédents, gestion de la campagne de vaccination, la ministre a défendu les grands axes de sa gestion de la lutte contre la pandémie. Elle a indiqué que des contrats de revente de vaccins avaient été signés avec le Qatar et Monaco, et que des discussions étaient en cours avec d'autres pays tels l'Ukraine et le Mexique.

Elle a précisé disposer actuellement du nombre nécessaire des vaccins monodoses "pour approvisionner l'ensemble des médecins libéraux qui seront volontaires pour vacciner". A l'étonnement de certains députés de l'opposition, elle a affirmé que "jamais les médecins généralistes n'ont été écartés". Elle a laissé entendre qu'on devrait réduire dès les prochaines semaines le nombre des centres de vaccination ouverts.

La ministre a indiqué avoir demandé à ses services "de travailler avec les représentants des pharmaciens d'officines pour étudier la possibilité, le plus rapidement possible, d'utiliser le circuit pharmaceutique habituel pour l'approvisionnement des médecins", quand les centres de vaccination seront fermés.

Mme Bachelot s'en est pris vigoureusement à ceux qui ont critiqué sa gestion, parlant d'"attitude désinvolte et arrogante", de "dangereuse sophistique", de "risque de brouiller l'esprit des gens".Elle s'est adressé le reproche "non pas d'en avoir trop fait pour protéger nos concitoyens du risque pandémique, mais de ne pas en avoir fait assez peut-être pour les protéger de l'irresponsabilité de certaines personnalités publiques et de la désinformation qu'elles ont organisée".

"A vous entendre on croirait que l'opposition est responsable de l'échec de la campagne de vaccination", a déclaré Marisol Touraine (PS).

Jean-Marie Le Guen (PS) a émis des craintes sur la "perte de confiance" de la population, tandis que Gérard Bapt (PS), allant dans le même sens, s'interrogeait sur l'indépendance des experts. "Le débat principal, ce n'est pas une histoire de gros sous, mais de savoir quelles seront les séquelles de cette crise en matière de santé publique", a estimé Marisol Touraine.

Le député UMP Dominique Dord s'est lancé dans l'imagerie militaire. "Quel curieux pays que le nôtre, a-t-il dit, dans lequel une victoire semble se dessiner contre un ennemi redouté, et où le pays demande des comptes, alors même que la guerre n'est pas finie, à son général en chef, sur la manière dont il a conduit la bataille !".

"Une leçon qu'il faut tirer des crises pandémiques c'est qu'aucune ne ressemblera à l'autre et qu'il faut de la souplesse, de la capacité de réaction, et ne jamais calquer les choses les unes sur les autres", a conclu la ministre.

THE FLU CASE

French Health Minister Grilled by Deputies over Handling of Swine Flu Pandemic

The Flu Case, 13 January 2010 12:59
https://web.archive.org/web/20100220012442/http://www.theflucase.com/index.php?option=com_content&view=article&id=2550%3Afrench-health-minister-grilled-by-deputies-over-handling-of-swine-flu-pandemic&catid=1%3Alatest-news&Itemid=64&lang=en

Roselyn Bachelot, the French Health Minister, gave a "vehement" defence of her handling of the swine flu pandemic when grilled by deputies on Tuesday, according to a report on France24.

The session was followed by demands for a parliamentary mission of information from the socialist party and for a parliamentary inquiry from the Nouveau Centre party.

Deputy Jean-Marie Le Guen talked of "a loss of confidence" among the population.

World Health Organization

Transcript of virtual press conference with Dr Keiji Fukuda, Special Adviser to the Director-Generalon Pandemic Influenza

World Health Organization, Geneva, 14 January 2010

https://reliefweb.int/report/world/transcript-virtual-press-conference-dr-keiji-fukuda-special-adviser-director-generalon
https://reliefweb.int/attachments/dd64a51c-9d77-3f81-9b44-f059482ec2ba/1132A7B7D2F05AAD852576AB007341A6-Full_Report.pdf

Nyka Alexander: Good afternoon. We welcome you this virtual press conference, today, January 14th 2010. My name is Nyka Alexander. With us is Dr Keiji Fukuda, Special Adviser to the Director-General on Pandemic Influenza. He will be giving a situation update, speak in more detail on some topics, and will then take your questions. Before he begins, let me clarify that there is indeed video available of today's briefing. Sorry about the error in the advisory. We have also prepared two sound bites and B-roll of Dr Fukuda which went out via EBU, for those of you who might be interested in that format please contact the communications team of you want more details on that. Dr Fukuda, over to you now. Thank you.

Dr Keiji Fukuda: Thank you Nyka. Welcome everybody to this virtual press conference. Now before I begin with the main topic of the day which is the pandemic, I would first like to take a moment to note the very severe earth quake which has struck both Haiti and Dominican Republic. WHO wishes to express its profound sympathy for all of those who have been affected by the severe loss of life and the destruction in those countries. I know that there'll probably be a lot of questions about this event and if you have additional questions, please contact the communications team here.

Now what I would like to do today is again start off the conference with a very brief overview of the epidemiologic situation and then go into some of the main topics for the day.

In terms of the current situation, at this time the most intense pandemic activity continues to be in a couple of places in the world such as North Africa, in Southern Asia and then in parts of East and Southeast Europe. In other parts of the world, we see that activity is declining or has declined but we also continue to see in these areas a transmission of the virus, so it has not disappeared, and it is has not gone back to baseline. Based on the situation, our current assessment is that it remains too early to say that the pandemic is over. This is because we continue to see continued activity at elevated levels in a number of countries. And because it is unclear whether we will see in the northern hemisphere over the next few months during the winter and spring period another significant wave of activity and also because we do not know yet what will happen in the southern hemisphere during its winter months. So for these reasons, we consider that the pandemic is still ongoing.

Now, as an international health institution which deals with major global health events, WHO understands that it is the subject of criticism and questioning about what it may have done, and in this respect, we really welcome this when it is constructive, because it significantly helps us to improve how we do things. Now recently we were asked by the Council of Europe to participate in hearings about pandemic influenza, and we welcome this opportunity to talk about the pandemic, to provide accurate information and to clarify misconceptions. However, since there are still some misconceptions circuiting among the media, right now, what I would like to do today is address some of this directly and some of *the questions* which have been coming to us in the recent number of days.

The first question that I will talk about is *whether this is a real pandemic*,
- the second one is, *did WHO change its definition of the pandemic*,
- the third topic is, *did WHO overplay the pandemic* and
- the fourth issue is, *was WHO unduly influenced by industry*.

(I) So let's go to the first question: ***Is this a real pandemic***.
Here *the answer is very clear: yes*.

The allegation by some, that the H1N1 pandemic is a fake is both scientifically wrong and historically inaccurate. Let me start by going through some of the basics, so I can provide you with the context for why we can say this so clearly. With infectious diseases, scientists often talk about groups of infections, and they use different terms. So for example, when we talk about a small number of people being infected, we may use the word cluster, or we may use the word cases. And then when we're dealing with something larger, we may be using words, such as outbreak or epidemics. Now these are not precise terms, but they give you a sense of a relative difference in size. When we talk about the largest size, which is involvement of most of the world, then we're talking about a pandemic.

If we look specifically at the H1N1 pandemic, we can see that WHO was first notified about human infections in late April. At that time we had laboratory information which told us that this influenza virus was genetically and antigenically very different from the normal human influenza viruses circulating around the world. We had epidemiologic information which was provided initially from the North American countries Mexico, Canada and USA, which demonstrated convincingly that there was person to person transmission occurring at the start. Then we had clinical information, especially coming from Mexico, which told us that this virus could cause severe or life-threatening infections. At that time these reports themselves did not tell us that we were in a pandemic situation, but they did send a very strong warning to public health authorities around the world, including WHO, that we should be ready for a pandemic.

So let's go to some of the sequence of the events at that time. On 29 April 2009, WHO reported confirmed infections in 9 countries. About 6 weeks later, on 11 June, WHO reported that laboratory confirmed cases were being reported in 74 countries and territories. Just a few weeks later, on 1 July, WHO reported that there had been confirmed infections in 120 countries and territories around the world. It is this global spread which led WHO to call for increasing phases as we proceeded, and also to eventually tell the world that a pandemic was definitively under way.

So at this point, let's not play word games, and let's not be indirect about this matter. This is a new influenza virus that emerged in 2009 in North America. At the most conservative count that we have, we estimate, we believe, or we know that about 13,000 people had been killed directly by this virus. When final estimates are made, for the world, at some point in the future, we anticipate that these figures will be much larger that what we see now. *The allegation that this is not a pandemic is scientifically wrong and is historically inaccurate*. I also want to note in passing that it is somewhat disrespectful, for the many people who were affected by the serious illnesses caused and for the deaths that were caused by this influenza virus, as well as to the very large number of people in all countries who have been working around the clock to protect others from this pandemic.

(II) Now let me move on to the second issue. ***Did WHO change its definition if a pandemic***?
- The answer is no, *WHO did not change its definition*.

So again, let me provide a little bit of context here for this answer. Let me start by pointing out that there are many sources that any of you can go to, to look up the word pandemic, and find the definition and you can find these in textbooks, you can find these simply by going to the web, and typing in 'definition of pandemic'. What you'll find is that definitions are sometimes worded somewhat differently but all of them basically agree that *the pandemic is a worldwide spread of an infection or a disease*.

Now different diseases can have different features when they cause a pandemic. A pandemic of HIV/AIDS for example has features which are very different from a pandemic of influenza. And even when we look at influenza pandemics, we can see that there are significant differences between the pandemics, for example, the pandemic caused by the 1918 virus, resulted in the greatest number of deaths that we know of, and more than what we saw in 1957 or 1968, as well as 2009. But the basic idea is the same: *there is the world wide spread of a disease*. WHO has consistently emphasized this concept in these definitions.

The formal definitions of pandemics by WHO can be seen in the guidelines which have been provided to countries. Now these guidelines were first developed in 1999 and then updated subsequently in 2005 and then in 2009. And when you look at them you will see how the many hundreds of scientists who work with WHO on these definitions and on these guidelines really tried to improve the definitions to make them clearer from the guidelines. One of the things that *WHO did not do in any of these definitions was make* ***severity*** *part of the definition*. And the reason for this was very simple: when we look at history to tell us, that the impact of pandemics can range from being mild up to very severe. We know that, and so we know that when we see the spread of these new infections, that the impact of the pandemic may eventually vary from one extreme to the other extreme. So the documents are technical, but I really encourage you to look at them to see what the definitions really have said.

(III) Now let me go to the third issue: ***did WHO overplay the pandemic***?
The answer here is no, *it did not*.

I would like to refer you back to the speech given by the director-general, Dr. Margaret Chan, when she first announced the pandemic. In that talk to the world, what she said was that we had reason to believe that the pandemic would be of "moderate severity".

Now from the very beginning WHO has gone out of its way to let everybody know that the future course of the pandemic was uncertain, that we did not have a crystal ball and could not tell you at the beginning, which way it was going to go. This remains as true today as it was back then. It is true, however though, when we're at the start of a new health threat, and particularly when there are so any unknowns, that often times the public and the media can react very strongly to the emergency of such a health treat, that at the time and all through the pandemic, WHO has been very consistent in the information that it has given.

Now given this reality there is no health authority, including WHO, which can afford to sit back before making decisions, and actions have to be taken, because we have to provide support to countries and other institutions, working to reduce the impact of the situation. In providing this information, WHO has always been very balanced and I think sober in providing its assessments.

We've worked very hard to neither overplay, nor underplay the situation and we have worked very hard to try to reduce confusion, rather than to create it. Now, since we have always known, and have repeatedly said, that pandemics can range from mild to severe, we have also pointed out that the severity can change midstream. And given this situation, WHO and other responsible health authorities have adopted a precautionary approach – that is, we have tried to prepare everyone for the worst and to hope for the best.

So at this point, I think that the health impact of this pandemic can fairly be said to be moderate compared to the health impact of some of the pandemics in the past. But I also want to point out that the means and the actions taken by countries to deal with this pandemic have been by far the best in history, We don't know how many infections and death have been avoided or prevented by the actions taken by countries and we don't know how much these efforts have helped mediate the overall effect of the pandemic, but we firmly believe that these effort should not be discounted.

(IV) Now, I would like to go to the fourth issue: ***was WHO inappropriately influenced by the pharmaceutical industry***?
And the answer here is no.

Now, again, let me try to provide some context. When WHO responded to the pandemic, one of the things we did as soon as possible was to reach out to a wide variety of experts and sectors around the world including industries. We had discussions with them on a variety of topics, and with the industry representatives, we talked both about vaccines and vaccines viruses and what could be done to expedite the production of vaccines as quickly as possible.

Now the question is not really whether we had contact with the industry, but *whether we had any undue influence exerted upon us by commercial interest*. *And the answer is no*. WHO has long recognized that in reaching out to such a broad group of experts and interest groups, that there is a risk for potential conflicts or interests in the advice which is provided to the organization. So to protect the integrity of the advice which was given to WHO, to remain free from any undue influence, WHO has had in place routine safeguards against potential conflicts of interest in the advice given to WHO. This is really a longstanding practice and is true at all times, and certainly well before this pandemic, but also during this particular pandemic.

Now WHO requires the experts, who provide advice to the organization, to declare all their professional and financial interests including funding, which is received from pharmaceutical companies, or consultancies, or other forms of professional involvement with these commercial interests. This information is then shared with other members, shared within the institution to look at them for appropriateness, and then if the person is part of an advisory group, it is shared with other members of the advisory group and it is taken into account by WHO in determining whether the experts concerned should continue to provide advice to the organization.

Finally here I'd like to note that any allegations of undeclared conflicts of interest are taken very seriously by WHO and we respond immediately and appropriately to them.

So in passing let me just make or end with one other point, and this is, we have received some questions, about whether WHO will be undergoing a review process and the answer is yes, we will be conducting a self review along with others of what happened during this pandemic. Now similar to almost any organization which is concerned with the quality of its work, WHO assesses its performance during major experiences and then works to learn from that, so-called lessons learned, and then to take those lessons learned and to improve from it. Now in this instance, WHO and the countries in the world operated under the International Health Regulations. Now the International Health Regulations call for an evaluation of how well the regulations have been implemented and so WHO will use this opportunity to begin an evaluation of its own performance.

So at this point, let me conclude again with just **three short remarks**.

In the first place I want to emphasize the *world is going through* ***a real pandemic***. The description of it as fake, is both wrong and is irresponsible.
The second point is that *WHO has been* ***balanced*** *and* ***truthful*** *in the information it provided* to the public. It has not underplayed and it has not overplayed the risks of the pandemic.
The third point is that *WHO has reached out to* ***all parties*** who could help to reduce harm from the pandemic but we did take very great care to make sure that the advice received was not unduly influenced by commercial or non-public health interests.

So with that, let me stop here and then I am happy to take **any questions you may have**.

Nyka Alexander: Thank you, Dr Fukuda, thank you very much. Before we go over to questions, may I remind you that an audio file of Dr Fukuda's briefing will be available immediately afterwards, in the Media Centre section of the WHO web site and a transcript will be available a few hours later. To ask a question, please type 01 on your keypad to get in the queue. The first question is from Martin Enserinck, Science magazine. Please go ahead.

Martin Enserinck, Science: Could you be more specific about the review that you mentioned, you were talking about a self review. What does that mean? And wouldn't it be more appropriate to have some kind of independent outside team to look at how this was handled.

Dr Keiji Fukuda: Thank you Martin, and let me clarify here. The International Health Regulations call an agreement among all member states for which WHO acts a kind of a secretariat for the International Health Regulations. And those regulations call for a review of how the regulations themselves have been implemented. And given that we have gone through such a major experience over the past several months, and continue to go through it, we have decided that this will be a very good opportunity to use this assessment to look, begin to look at the response to the pandemic.

So the assessment itself, of course, will involve many people who are unrelated to the IHR, or who are unrelated to WHO. These will be people who are not part of WHO but who will be asked to conduct the assessment and conduct the review of the pandemic and our performance. And so in that sense, it is really not a self-performed evaluation. It will be done by others. But what I meant in my comment was that, we recognized that we need to use these opportunities really to improve our own performance, and in this regard, WHO is really pushing for this kind of evaluation to be done. Thank you.

Eva Cruz, Spanish Public Radio: I am asking about the particular case in Spain, I know it’s the same in other countries. Spain bought 37 million doses of vaccines of which only 13 million have been used. Is there, will there be any measures put in place, in order to save money in this kind of prevention strategy in future. What can we learn from the excessive buying of theses vaccines?

Dr Keiji Fukuda: This is a very good question. The decisions by countries to, whether to buy vaccines and then how much vaccine to buy have really been decisions made on country by country decisions basis. WHO was not asked by these countries to provide advice on those kinds of decisions, and has not taken part in any of these discussions.

I do want to point out, however, that the public health authorities involved in these discussions, really have a very difficult task when they are facing questions about how much vaccine for example to purchase.

Now at the beginning of the pandemic and during much of the pandemic, it was really not clear what the ultimate impact of the pandemic would be. How many people might die, how many people might suffer serious illnesses from it and so on. And in that kind of uncertainty, the health authorities still had to go ahead and make decisions about what to buy. And so I think it is really impossible to second guess the wisdom of these decisions. And I think that at the time these decisions were made, I am sure that the top consideration was that, "what needs to be done to reduce harm from the pandemic."

Now I think that at this point, again, I want to point that the pandemic continues. If the pandemic virus changes and we begin to see much more serious illness from infections, it is quite possible that countries will also be asked why they did not buy more vaccines. So I want to point out that this is a very difficult decision that has to be made in the face of not having all the information that one would want to have. Thank you.

Helen Branwell, Canadian Press: Hi, if I could ask a couple of questions.

Dr Fukuda, you were talking about the review in answer to Martin's question, I was wondering if you could tell us what will happen with any report that comes out of that process will be made public, how does WHO go about sharing the findings of that.

The other question was when you were talking about the suggestion that the pandemic definition had been changed. You said that, you talked about the fact that there has been series of iterations. I think you said that severity was not removed from it but I thought it was in an earlier iteration? Is that not true.

Dr Keiji Fukuda: Thank you for the two questions. So that let me first go to the IHR.

One of the first things that will happen is that the executive board of the WHO will be meeting next week, and so this idea for an assessment will be run by the board. And there will be discussion, and I think that we will receive guidance from the member countries, as to how to conduct some aspects of the assessment. Now I am sure that the results of such assessments will be made available. I cannot tell you at this point how and when this information will be made available. But of course this will both be useful to WHO but also to a number of other organizations and countries. And so I anticipate that the findings of such an assessment will be available.

Now in terms of the *pandemic definition*, I think that there has been a lot of confusion, because there have been a number of different documents which have talked about pandemics. Now some of the documents which have been put up, have been descriptions of pandemics, and particularly, some of the descriptions of potential pandemics were put up during the time when the concern about the Avian H5N1 infection were very strong. And I think in some of these descriptions, for example, one which is posted back in 2005, there was an emphasis on the more *severe potential impact of a pandemic*. And I think that some of the people have gotten this confused, have confused this kind of description with the definition of a pandemic.

But when you go back to the guidelines, and there were guidelines produced in 1999, 2005, and 2009, you will see that although there is discussion about these pandemic definitions and there is some continual attempt to try to make them clearer, *severity itself was not part of the definition*...

Debora MacKenzie, New Scientist: We have been seeing a lot in the press in the last little while, commentaries of various kinds saying, 'Oh well, it was not very much, it was ordinary flu'. Obviously that is not true as you have said. But there is a feeling out there, right or wrong, that was an awful lot of alarm, and a lot of vaccines bought, and then it did not turn out to be much. Do you think that there is now a chance that there could be a backlash and this could harm future efforts to prepare for flu pandemics and other kinds of health events and is there anything you would like to say about that?

Dr Keiji Fukuda: I think that in this kind of situation, the greatest danger is from a lot of misinformation being passed, and I think from misperceptions about what was done. So again, what I want to state and be very clear about is that at the outset of the pandemic, when the public health authorities around the world were dealing with this situation and facing many unknowns, this is when they had to make a lot of the decisions about what to do. And this is when many of the hardest decisions were coming up during the pandemic. So I think that, in general, what health authorities, including WHO, most strongly hold forth as the most important goal is to make sure that everything can be done to protect people from harm. So in this situation, I think that this is an application of the so-called precautionary principle: prepare for the worst and hope for the best. And so here, what I hope for is that people understand that the decisions that were made were done in a very sober light. They were done recognizing that the pandemic could be more on the mild side and could be on the more severe side, and that the decisions that were taken were really very prudent, trying to take all practical steps and practical decisions that could be made to minimize the chance that people will be harmed. And so I think that if people understand this, they will understand that their governments by and large, were making the decisions that have to be made when you are facing a new global health threat. Thank you.

Martin, Dublin, Ireland: Dr Fukuda, you talked about the conflicts of interest, and as WHO requires people to clear any conflicts of interests. Has there been any case in the past with WHO, where they have disregarded the opinion because of a very *obvious conflict of interest*?

Dr Keiji Fukuda: Martin, you know, the conflicts of interest are identified by a variety of means, and then these are sometimes brought up within specific advisory groups. For example we have an advisory group called SAGE, which is the Strategic Advisory Group of Experts, which provides guidance and advice to the DG on immunization practices. And so there may be instances among some of these different kinds of advisory groups like that, but I would have to go back and ask

whether we have any specific instances. More frequently is the situation where a potential conflict of interest is identified and then after assessing the situation, a decision is made as to whether there is a real conflict of interest or not. So we can come back and find specifics, but in general this is what is done. Thank you.

El Mundo: I would like to ask you concerning the group of experts that is going to evaluate the WHO overplayed concerning the pandemic. Who is going to name this group of experts? Please.

Dr Keiji Fukuda: So the IHRs provide guidance. Again, the IHRs are basically the rules established by all of the member states of WHO, 193 countries. And these are the rules by which the members will be selected to conduct the reviews. So we will follow those regulations. Thank you.

Andrea Gerlin, Bloomberg: Can you tell us whether WHO is submitting testimony to the Council of Europe or making any response towards attending plenary session where they are going to discuss some of the issues they have brought up, I think on January 28?

Dr Keiji Fukuda: WHO has been invited by the Council of Europe to participate in a hearing on 26 January. And so right now, we are trying to find out the particulars of what the invitation actually means, and so we have not been told exactly what the participation means and what is being requested of WHO. Otherwise, we have not been invited to attend any other meetings, or any other events sponsored by the Council of Europe. But we are looking forward to participate but we do need more details from the Council of Europe. Thank you.

Joseph, The Sun: Dr Fukuda, there are countries that feel that they have an overload of vaccines, or vaccines that they no longer need with the impression that the pandemic is already a spent force. They are trying to sell off their stocks, and how do you advise them?

Another question – this misconception of the pandemic being '*much ado about nothing*', how is the WHO going to re-educate the world community that it is indeed a major pandemic out there.

Dr Keiji Fukuda: In terms of your first question about advice the countries about their pandemic stocks. Again this is not a question which countries are coming to WHO and asking for advice about. These are generally decisions which are being weighed and discussed by countries because it is their vaccines and they are the ones who have to make decisions about it. And I suspect that different countries may come up with different decisions. So at this time, WHO is not being asked to provide advice and we are not providing any guidance on what to do with the vaccines stocks. However, at this time, WHO is still emphasizing that vaccination is a very important part of addressing the pandemic. There are still large numbers of people out there who are at high risk of serious complications from this infection. And again this includes people who are women who are pregnant. This includes people who have a variety of chronic medical conditions. These are the people who have; in general, developed the most serious complication from the infection. And that continuing to vaccinate these people is one of the best things that can be done by a country, if it has vaccine available. So this is one point that I would like make very clearly and very strongly.

Now in terms of your second question about what does WHO, what does an organization like WHO do to try to address the point about whether this is a real pandemic and to educate people. And so there are a variety of things that we do. One of the most important is to reach out to the media and to talk with you, in discussions like this, with the hope that you will be part of getting the information out there, getting real information out which is accurate, and hoping that you will help to combat some of the false information and some of the misperceptions out there. In addition, we continue to work with a variety of different groups, and provide information directly through things such as the web, and through documents, and through interactions at meetings. So we will continue to do all of these things, and we will continue to provide as much good information as we can...

The Independent, South Africa: My question has largely been answered by the previous journalists. I also wanted to know that with countries reducing their vaccines, *whether pharmaceutical will be trying to offload those vaccines in African countries instead*. And I know you said that the WHO

doesn't get involved in advising governments in what quantities of vaccines to buy but I also wanted your opinion on whether African countries should be wary of this kind of offloading.

Dr Keiji Fukuda: Let me point out some important things which WHO has been involved in which directly involves Africa to address this point.

Now some months ago, in fact, one of the most important things that the DG did in concert with the Secretary General of the United Nations was to make a call for global solidarity, that is, for the countries that had vaccines, for the richer countries to help out other countries that did not have access to the vaccine. This took place many months ago and was repeated, and because of these calls for action, one of the things that happened was that a number of countries as well as some of the commercial companies donated vaccines to WHO; pledged vaccines to WHO, as well as some of the ancillary supplies such as syringes and safety boxes and so on, to try to get vaccines to countries that don't have access to these vaccines, largely lower income to middle income countries that without this kind of support would not have access to vaccines. We continue to work on this. Many of these countries, of course, are located in Africa and we will continue to try to get vaccines to them in as rapid a manner as is possible. So we believe that the vaccine in a pandemic situation can be used to protect people who are at high risk from complications and we hope we can push ahead with this effort.

Nathalie: I talked to people from the Council of Europe and they said that *WHO does not want a public debate on the 28th or 26th*, and that you have asked for a session behind closed doors. I wanted to know whether that was true. And also, second question, about the vaccine. I see that some contracts with the industry about the vaccine production were already made in 2007 after the bird flu, and that part of these contracts was that the companies would produce vaccines when a pandemic would arise and that the governments would pay them. There was no real option for cancelling it. So I think that might be one of the problems here, and I would like to have a reaction to that.

Dr Keiji Fukuda: OK; thank you for the two questions.

In the first question, let me be very direct and very clear. The Council of Europe has not asked WHO whether it prefers an open door meeting or a closed door meeting, and WHO has offered no request to the Council of Europe for a closed hearing. We were expecting that this might be an open hearing, but WHO definitely has not asked for a closed hearing. This is not true.

Now in terms of the second point and the vaccine contracts. Again, WHO has not been privy to any of the contract discussions between countries and the companies. These are considered proprietary discussions both by the individual countries themselves as well as the companies. So we do not have knowledge of the individual contracts which are made between countries and companies. However, I think it is fair to point out that the pandemic preparedness planning for pandemics have recognized that vaccines, if available, would be an important part of the response against a pandemic, and would be one of the better ways to try to prevent people getting infected by a pandemic influenza virus. And so I would not be surprised for the discussions and pre-planning done by countries or companies as part of the general thinking about preparedness for a pandemic. But again, I cannot comment on any of the specifics because we simply have not been privy to the information.

Nyka Alexander: That's all we have time for today. I apologise to the journalists who were not able to get their questions through…. This has been the virtual press briefing from WHO Headquarters with Dr Keiji Fukuda, Special Adviser to the Director-General on Pandemic Influenza. I would like to remind you that there will be an audio file posted on our website shortly and later today or tomorrow morning a transcript of the briefing. The web site is www.who.int/pandemicflu. Thank you again, and have a good day.

Swine flu pandemic 'virtually over'

Manx Radio, 14 January 2010, 18:35:04
https://web.archive.org/web/20100115194559/http://www.manxradio.com/newsread.aspx?id=41959
http://www.theflucase.com/index.php?option=com_content&view=article&id=2561%3Aswine-flu-practically-over-in-uk-says-health-official&catid=1%3Alatest-news&Itemid=64&lang=en

The Director of Public Health says the swine flu pandemic is just about over on the Island.

Dr Parameswaran Kishore says no new cases have been reported since Christmas and he's not expecting any new outbreaks.

He says the Island may have been over-prepared with huge stocks of vaccine and anti-virals left unused - but says it was better to have them and not need them than to need them and not have them.

Dr Kishore says both here and in the UK, the disease seems to be on the wane.

CDC: As many as 80 million infected by H1N1

CNN, 16 January 2010, 3:30 a.m. EST
https://web.archive.org/web/20100121011348/http://edition.cnn.com/2010/HEALTH/01/16/h1n1.numbers/

Atlanta, Georgia (CNN) – As many as 80 million Americans were sickened by and another 16,000 died because of the H1N1 influenza virus between April 2009 and December, the Centers for Disease Control and Prevention said Friday.

Those numbers are at the high end of the CDC's estimate. The number of infected could be closer to 39 million while deaths could be about 8,000.

Exact counts are difficult to obtain because many people with the flu don't seek medical care and only a small number who do are tested.

The H1N1 virus is still circulating and causing illness, hospitalization and death, according to the CDC, which recently made another call for vaccination. About 61 million Americans have been vaccinated.

Vaccines are widely available, with more than 130 million doses produced and 160 million people at high priority for getting the vaccine.

Margaret Chan

Progress in public health during the previous decade and major challenges ahead

WHO, Geneva, 18 January 2010

https://www.who.int/director-general/speeches/detail/progress-in-public-health-during-the-previous-decade-and-major-challenges-ahead

Mister Chairman, members of the Executive Board, excellencies, ladies and gentlemen,

...

Ladies and gentlemen,

For me, the best health news of the previous decade is the fact that the long overdue influenza pandemic has been so moderate in its impact. Had the pandemic taken another course, the agenda for this session would have looked very different. Had the virus mutated to a more virulent form, we would not be talking about forging ahead. We would be standing still or dealing with serious setbacks.

We have been fortunate since the very emergence of the new H1N1 virus, and have remained fortunate up to now. The virus initially spread in countries with good surveillance systems. The honesty and speed of early reporting set the standard for the international response.

The virus did not mutate to a more virulent form. Resistance to oseltamivir did not become widespread. The vaccine proved safe and a close match with circulating virus. Things could have gone wrong in any of these areas.

We were fortunate in other ways. This is the first pandemic to occur since the revolution in communications and information technologies. For the first time in history, the international community could watch a pandemic unfold, and chart its evolution, in real time.

The amount of data that have been collected since April of last year, and the number of research reports and studies that have been published, have been remarkable. This quick collection of information has allowed WHO to issue treatment guidelines, track the epidemiology, and keep a close watch for mutations, including those that confer resistance to antiviral drugs.

When the history of this pandemic is written, I believe that the speed of actions taken by governments to protect their populations will earn the highest marks. Though the burden on emergency rooms and intensive care units has been heavy, nearly all health systems have coped well. Let me pay tribute to all the health care workers who have worked tirelessly to care for patients.

The early standard of rapid and transparent reporting was upheld, and the sharing of information, diagnostic support, test kits, and viruses has been commendably generous. To date, well over 23,000 viruses and other specimens have been submitted to WHO network laboratories for analysis.

During any public health emergency, health officials must make urgent, often far-reaching decisions in an atmosphere of considerable scientific uncertainty. Given our duty to safeguard public health, the tendency of officials facing such a situation is nearly always to err on the side of caution. I believe we would all rather see a moderate pandemic with ample supplies of vaccine than a severe pandemic with inadequate supplies of vaccine.

In some countries in the northern hemisphere with good surveillance systems, the pandemic appears to be easing. The worst may be over. But it would be unwise for anyone to reach firm conclusions before April, when the normal influenza season usually ends. There is still quite a lot of winter left.

In addition, we cannot predict what will happen between now and later in the year, when the southern hemisphere enters its influenza season and the virus becomes more transmissible.

Data for most parts of Africa are sparse. We are concerned that some countries in the western part of the continent remain susceptible to intense waves of transmission. We do not know for sure, but we are keeping a careful watch.

Population susceptibility to infection by a new virus drives the dynamics of an influenza pandemic. This is the critical question. Are there enough susceptible people left to sustain further waves of community-wide transmission? At present, we simply do not have enough data to answer this question with certainty. Studies are, however, under way.

We can estimate how much immunity has been conferred through vaccination. But knowing how much natural immunity has been acquired through infection is more difficult, especially given the very mild nature of illness in the vast majority of patients. Some infections produced no symptoms, and quick surveys of influenza-like illness will not capture these infections.

In short: I believe that what most countries are doing, that is, urging their populations to get vaccinated, is the prudent public health approach. Each country has to assess its own epidemiological situation and the needs and concerns of its citizens. For developing countries concerned about their lack of access to pandemic vaccines, WHO is ramping up its donation programme.

This pandemic has also been the first major test of the revised International Health Regulations. They have given the world an orderly, rules-based way to respond, and this has been an asset. With few exceptions, social and economic disruptions have been far less significant than feared. Another strength of the International Health Regulations is its system of checks and balances. They ensure that no one, myself included, has unfettered power.

Although the virus has not yet delivered any devastating surprises, we have seen some surprises on other fronts. We anticipated problems in producing enough vaccine fast enough, and this did indeed happen. But we did not anticipate that people would decide not to be vaccinated.

I mentioned the revolution in communications and information technologies. In today’s world, people can draw on a vast range of information sources. People make their own decisions about what information to trust, and base their actions on those decisions.

The days when health officials could issue advice, based on the very best medical and scientific data, and expect populations to comply, may be fading. It may no longer be sufficient to say that a vaccine is safe, or testing complied with all regulatory standards, or a risk is real.

In my view, this is a new communications challenge that we may need to address. As the items on your agenda show, persuading people to adopt healthy behaviours is one of the biggest challenges in public health.

In terms of managing public perceptions, part of the problem arises from the big difference between what was expected, after watching the highly lethal H5N1 virus for so long, and what fortunately happened. An event similar to the 1918 pandemic was feared, when what actually happened is probably closer to the 1957 or 1968 pandemics.

Let me introduce a word of caution. Reliable estimates of the number of deaths and the mortality rate during the current pandemic will not be possible until one to two years after the pandemic has ended.

Let me reassure you on a final point. This has been the most closely watched and carefully scrutinized pandemic in history. We will have a wealth of new knowledge as a result. It is natural that every decision or action that shaped the response will likewise be closely and carefully scrutinized.

WHO can withstand this scrutiny. ...

HSJ

Swine flu preparations cost £1bn

HSJ, 19 January 2010

https://www.hsj.co.uk/finance-and-efficiency/swine-flu-preparations-cost-1bn/5010530.article
https://web.archive.org/web/20100220012809/http://www.theflucase.com/index.php?option=com_content&view=article&id=2608%3Aflu-pandemic-plans-cost-uk-a-billion&catid=1%3Alatest-news&Itemid=64&lang=en

The government spent more than £1bn in preparation for a flu pandemic, it has been disclosed.

The Government spent more than £1 billion in preparation for a flu pandemic, it has been disclosed.

Health minister Gillian Merron said spending to date on "pandemic influenza preparedness – not swine flu specific" was about £500 million.

"Additional spend committed around the time of the start of the swine flu pandemic takes the amount to over £1 billion," she said in a Commons written reply to Labour's Paul Flynn.

Only last week, Mr Flynn (Newport W) challenged Health Secretary Andy Burnham directly over the build-up, which some have criticised as an over-reaction.

"Was the threat of 65,000 British swine flu deaths an unscientific exaggeration that has cost the country dearly, not only financially but in terms of stress and distorted NHS priorities?" he asked at question time then.

Mr Burnham defended the Government's response, saying: "We had to take every possible step to keep the country safe through what was declared a world health pandemic, not by this Government but by the World Health Organisation.

"We saw the events in Mexico in the spring, followed by the exceptional spike in flu cases in this country in the summer.

"There were understandably high levels of public concern, and I make no apology for making all the necessary preparations to keep the public safe through that. We have come through the pandemic because of the strength of the plans and preparations that this Government put in place."

In another written reply, Ms Merron said nearly 29 million doses of swine flu vaccine had been delivered to the UK by January but refused to put a cost on them as it would "violate confidentiality clauses" with the makers.

ScienceDaily

1918 and 2009 H1N1 Flu Probably Not Spread by Birds

Science Daily, 20 January 2010
https://www.sciencedaily.com/releases/2010/01/100119213039.htm

Science Daily (Jan. 20, 2010) – The two strains of the H1N1 influenza virus responsible for the 1918 and 2009 global flu pandemics do not cause disease in birds. The results of the study, published in the February issue of the Journal of General Virology, also show it is unlikely that birds played a role in the spread of the H1N1 virus in these pandemics.

Scientists from the Canadian Food Inspection Agency's National Centre for Foreign Animal Disease (NCFAD) in Winnipeg, Canada, together with collaborators in the USA, injected the 2009 and 1918 H1N1 virus strains individually into chickens. None developed flu symptoms or showed any signs of tissue damage up to18 days later, although about half the chickens developed antibodies against the 1918 H1N1 virus showing limited infection. The 1918 H1N1 virus also did not cause disease in ducks. The origin of the 1918 H1N1 virus is unknown and despite its genetic similarity to avian influenzas, the results of this study show it is unlikely to have jumped the species barrier from chickens to humans.

Different strains of influenza cause disease in humans, birds and pigs; each type of virus is adapted to cause infection in its host. All cause similar respiratory symptoms. If flu viruses are passed back and forth between hosts (e.g. through close human contact with infected animals) the mixing can lead to development of a novel strain. As they have not encountered the virus before, the human population has little or no immunity to a novel strain which can easily cause infection and spread from person to person. This may ultimately lead to a global flu pandemic.

Dr Shawn Babiuk, a scientist with the National Centre for Foreign Animal Disease who led the research, said, "Working out how major human pandemic flu viruses affect birds and other domestic animal species is crucial in discovering what role, if any, they play in spreading viruses in the human population." Such studies can inform government decisions in responding to outbreaks of influenza in birds, which have major implications for poultry producers. According to Dr Babiuk, "These findings support the use of normal veterinary management practices in poultry infected with pandemic 2009 H1N1 influenza and demonstrate that quarantining and culling infected stocks is not necessary."

Dr Babiuk explained that viruses can behave unpredictably. "Our understanding of exactly how influenza viruses go on to cause pandemics is still limited," he said. "Although our research indicates that birds are unlikely to have played a part in the spread of the 1918 and latest 2009 H1N1 pandemic viruses, they may well still play a part in future pandemics."

THE FLU CASE

Flu pandemic plans cost UK a billion

The Flu Case, 20 January 2010, 16:34
https://web.archive.org/web/20100220012809/http://www.theflucase.com/index.php?option=com_content&view=article&id=2608%3Aflu-pandemic-plans-cost-uk-a-billion&catid=1%3Alatest-news&Itemid=64&lang=en

Flu pandemic plans cost a billion

The Government spent more than £1 billion in preparation for a flu pandemic, it has been disclosed.

Health minister Gillian Merron said spending to date on "pandemic influenza preparedness - not swine flu specific" was about £500 million.

"Additional spend committed around the time of the start of the swine flu pandemic takes the amount to over £1 billion," she said in a Commons written reply to Labour's Paul Flynn.

Only last week, Mr Flynn (Newport W) challenged Health Secretary Andy Burnham directly over the build-up, which some have criticised as an over-reaction.

"Was the threat of 65,000 British swine flu deaths an unscientific exaggeration that has cost the country dearly, not only financially but in terms of stress and distorted NHS priorities?" he asked at question time then.

Mr Burnham defended the Government's response, saying: "We had to take every possible step to keep the country safe through what was declared a world health pandemic, not by this Government but by the World Health Organisation.

"We saw the events in Mexico in the spring, followed by the exceptional spike in flu cases in this country in the summer.

"There were understandably high levels of public concern, and I make no apology for making all the necessary preparations to keep the public safe through that. We have come through the pandemic because of the strength of the plans and preparations that this Government put in place."

In another written reply, Ms Merron said nearly 29 million doses of swine flu vaccine had been delivered to the UK by January but refused to put a cost on them as it would "violate confidentiality clauses" with the makers.

Press Information Bureau, Government of India

India urges W.H.O. to explain reports on H1N1

Ministry of Health and Family Welfare, 20 January, 2010, 19:35 IST
https://web.archive.org/web/20110805153525/http://pib.nic.in/newsite/erelease.aspx?relid=57124

Secretary Health makes strong case for Generic Drugs

Secretary Health, K.Sujatha Rao urged World Health Organization (WHO) to effectively explain reports appearing in the media that the Swine Flu was a false pandemic. Making an intervention in the Executive Board meeting of WHO currently going on in Geneva, Secretary Health pointed out that such news reports were adversely impacting upon the public health measures being undertaken by countries.

She also called for greater transparency about terms and conditions on which international vaccine manufacturers were supplying vaccines to countries, In response to this intervention by India, it was agreed that WHO would formally write to National Focal Points in all countries clarifying the factual position about the H1N1 pandemic to quell all doubts that had been created.

Commenting upon the report of the WHO on the progress towards achieving the Millennium Development Goals Secretary Health urged WHO to clearly promote generic drugs as a strategy for rational drug use.

India emphasised that it is only the WHO that has the credibility to withstand the persuasive power of branded and patent drugs. India urged all countries to promote access to medicines and not to confuse the issue of counterfeits which is an IPR issue with safe and efficacious generic drugs.

WHO to Clarify H1N1 data after False Pandemic Claim

Bloomberg, 21 January 2010, 02:55 EST

http://www.bloomberg.com/apps/news?pid=20601202&sid=ahj0H_RH8U68 – deleted
https://web.archive.org/web/20100220012849/http://www.theflucase.com/index.php?option=com_content&view=article&id=2623%3Awho-to-clarify-h1n1-data-after-false-pandemic-claim&catid=1%3Alatest-news&Itemid=64&lang=en

January 21 (Bloomberg) – The World Health Organization will clarify data on swine flu after media reports of a false pandemic hindered public health measures, India's Health Secretary K. Sujatha Rao said.

Governments from the U.S. to Germany are curbing purchases of vaccine to fight the new H1N1 virus after cases declined and the first flu pandemic in 41 years appeared milder than initially feared. The Parliamentary Assembly of the Council of Europe plans to debate the theme "Faked pandemics: a threat to health" at a plenary session in Strasbourg, France, next week.

At the United Nations agency's executive board meeting in Geneva this week, Rao asked the WHO to explain media reports about a false pandemic, she said yesterday in a statement to India's Press Information Bureau.

=> https://web.archive.org/web/20110805153525/http://pib.nic.in/newsite/erelease.aspx?relid=57124

Rao also called for greater transparency about terms and conditions on which international vaccine manufacturers were supplying the shots to countries, according to the statement.

"In response to this intervention by India, it was agreed that WHO would formally write to national focal points in all countries clarifying the factual position about the H1N1 pandemic to quell all doubts that had been created," the statement said.

News reports were "adversely impacting upon the public health measures being undertaken by countries," Rao said in the statement, without elaborating. Rao and Vineet Chawdhry, a joint secretary at India's health ministry, weren't immediately available for comment.

WHO Director-General Margaret Chan acknowledged at the board meeting yesterday the need to support the agency's member states, WHO spokesman Gregory Hartl said in an interview today.

"For me, the best health news of the previous decade is the fact that the long overdue influenza pandemic has been so moderate in its impact," Chan told the meeting on Jan. 18. "I believe we would all rather see a moderate pandemic with ample supplies of vaccine than a severe pandemic with inadequate supplies of vaccine."

CIDRAP

Michael T. Osterholm

The H1N1 pandemic: The next chapter

CIDRAP, 21 January 2010
https://www.cidrap.umn.edu/business-preparedness/h1n1-pandemic-next-chapter

Only 3 months ago, here in the United States and many parts of the Northern Hemisphere we were experiencing the peak case occurrence of the second wave of the novel H1N1 influenza pandemic. Fearful parents were scrambling to find the precious few doses of vaccine available in their communities. Reports of people dying emerged almost daily in every state, and many of the deaths were among young adults and children. Then, practically in a flash, everything changed.

At this moment the world is experiencing one of the lowest levels of influenza activity caused by either pandemic or seasonal influenza viruses ever documented in the Northern Hemisphere in mid January. Wow, what a difference a few weeks can make.

The change is so startling, in fact, that some people have gone so far as to suggest that the first pandemic of the 21st century was fabricated by the World Health Organization (WHO) to sell certain pharmaceutical companies' vaccine. The Parliamentary Assembly of the Council of Europe plans to debate the theme "Faked pandemics: a threat to health" at a plenary session in Strasbourg, France, next week.

What happened? Were we fooled by predictions of a "severe storm" only to have it not materialize? Or did we, in fact, just come through a bad storm? Could we be sitting in the eye of a hurricane, unaware that the winds are about to whip up again? Or did something like a summer thunderstorm just pass? In the swirl of such questions, can you offer your organization any solid message? Let me try to put my "pandemic weather hat" on and share a perspective.

Then . . .

First, some context. Remember the chaos of the early days of the emerging pandemic in late April and early May? The first reports from Mexico suggested that the illness caused by the newly found novel H1N1 was severe for many people and marked the potential beginning of a very dangerous period for humankind. Spread of this new virus to countries around the world occurred with the same speed of jet planes. By late May, the influenza scientific community had little doubt that we were witnessing the next influenza pandemic. But as more people became sick around the world, the clinical picture diverged from the initial one seen in Mexico. It was evident that most people infected with H1N1 were experiencing a more seasonal-like form of influenza.

Despite the changing clinical picture, the rapidly rising case numbers in many countries from around the world – and solid evidence that the novel virus differed markedly from the circulating H1N1 *seasonal* influenza strain – fully justified the WHO's declaration on Jun 11 that the world was experiencing the first influenza pandemic of the 21st century. Efforts today by some politicians or other skeptics to declare this situation anything other than a pandemic are simply examples of "flat earth" thinking.

And as I shared in my previous *Osterholm Briefing*, even if there is no third wave associated with this pandemic, the propensity for this novel H1N1 virus to cause such severe disease and death in a significant number of younger adults and children means its overall impact on the world's population (ie, total years of potential life lost before age 75) places it among the serious public health disasters of recent years. True, it has been far from a 1918-like pandemic to date, and we can be incredibly grateful that it wasn't.

. . . and now

So now that we have what appears to be a very large number of unused H1N1 vaccine doses sitting in government stockpiles around the world, we're hearing other critics suggest that governments overreacted when they made such large vaccine purchases. I have one word for such accusations: *irresponsible*.

Just imagine if governments of the world had not acted decisively last May to procure a larger number of doses of a life-saving vaccine – and one that takes 6 to 8 months to manufacture and deliver – and we ended up having a 1918-like pandemic. The masses would have called for the heads of any government or public health leaders (those who hadn't died from H1N1) who had failed to act aggressively in procuring and distributing such vaccine.

I believe any responsible person would rather answer for why they took the risk to protect people rather than to gamble with the potential of large-scale human disaster, as we saw with hurricane Katrina.

And finally, as I also noted in my previous column, the final obituary for this pandemic has not been written. While the second wave of the novel H1N1 pandemic has clearly passed and seasonal influenza activity is following a pattern seen after the three pandemics of the 20th century when it virtually disappeared, I wouldn't bet against a third pandemic wave over the next several months. An estimated half of the world's population remains vulnerable to H1N1 infection; they have not been infected or vaccinated and have no residual immunity from infection with a similar H1N1 virus from more than 60 years ago. As an epidemiologist, I can tell you that we're looking at more than sufficient fuel for another "pandemic forest fire" to race across the world.

Time will tell.

Bottom line for organizations

In the meantime, here's the message for you and your organizations: *Continue to push all of your colleagues and their family members to get vaccinated.* Don't wait to find out if there will be a third wave. Data from millions of persons vaccinated show that this vaccine is extremely safe, and it's available for many in the developed world.

I'd like to think that we're watching the rainbows on the backside of a "pandemic thunderstorm," but we can't count on it, because we're just as likely sitting in the eye of the hurricane. Unfortunately we don't have pandemic radar that gives us that answer. So we have to rely on common sense and reason, rather than wasting our time on conjecture and irresponsible blame. And we *do* have an effective vaccine that protects us should that hurricane scenario be right. Use it.

PULSE

Steve Nowottny

Early lessons from the swine flu pandemic

Pulse Today, 22 January 2010
https://www.pulsetoday.co.uk/views/clinical-areas/infectious-diseases/early-lessons-from-the-swine-flu-pandemic/

With the swine flu outbreak now officially all but over, PulseToday editor By Steve Nowottny looks at what we've learnt from the pandemic that hardly was..

If the flu pandemic has taught us one thing, it's to expect the unexpected, so never say never. There's always the chance we could be caught off-guard by a surprise third wave. But yesterday the Chief Medical Officer Sir Liam Donaldson confirmed what GPs on the ground already knew - that with new cases of swine flu having fallen to their lowest level yet, the current outbreak is 'virtually concluded'.

Over the coming weeks and months swine flu and the NHS's response to it will be subject to intense scientific scrutiny. (As I write, an invitation to an international swine flu conference in March with more than 20 breakout sessions has just popped into my inbox.) But it's not too early to draw a few preliminary conclusions – conclusions which might help shape our response to a future pandemic:

1/ Global spread is inevitable and rapid. When I blogged immediately after the swine flu story broke, I warned that 'the best modelling suggests that it will reach the UK between 4-8 weeks after it begins in the country of origin.' While it's hard to pinpoint exactly when H1N1 first originated in Mexico, if anything, swine flu spread even quicker.

2/ The modelling got it wrong. Consistently wrong, in fact. First we were told that it could be very bad, avian flu bad, and it wasn't. Then the prediction was that it would die down as soon as early summer hit – in fact, GPs at practices across the country were at full stretch when the first wave peaked in mid-July. Then Sir Liam infamously admitted that DH modelling predicted as many as 65,000 people in the UK could die this winter – a prediction which was soon rapidly revised.

3/ Diagnosis by call centre leaves a lot to be desired. With the benefit of hindsight, of course, it's easy to forget the almost audible sigh of relief at practices up and down the country when the National Pandemic Flu Service first swung into action, just as the first wave was reaching its peak. But doubts soon set in, with Pulse revealing in September more than a third of practices had had patients suffer complications after being misdiagnosed, and reports of patients dying from meningitis. Lurid tales in the Daily Mail of call centre workers diagnosing patients while high on cannabis or drunk on vodka didn't do much to inspire confidence either.

4/ Pandemic response can take on a life and momentum of its own. Once the Government had set its pandemic response plans – geared perhaps too specifically towards avian flu – in motion, everything which followed became almost inevitable. Was such widespread Tamiflu necessary? Possibly not – but the stockpiles were there. Would the Government choose again to conduct such an ambitious mass vaccination programme? Possibly not – but at the time the decision was taken, it certainly seemed the sensible course of action.

5/ Finally, we got lucky. With the benefit of hindsight, much will be written about how the threat of pandemic flu was overplayed – and certainly hundreds of millions has been spent on dealing with a limited threat at the time that the NHS could ill-afford it. But ultimately the limited nature of the threat has been due to the nature of the virus itself rather than any public health intervention, and it's easy to forget how close some GP services came to toppling over.

Certainly for out-of-hours GPs in hotspot areas such as Birmingham and Tower Hamlets, swine flu won't be remembered as a damp squib. More of a lucky escape.

THE WALL STREET JOURNAL.

Carl Bialik

Swine Flu Count Plagued by Flawed Data

WSJ, 23 January 2010
https://web.archive.org/web/20100305022042/http://online.wsj.com/article/SB20001424052748704509704575019313343580460.html

Last April, as news reports from Mexico painted a frightening picture about the emergence of swine flu, ill students started coming in to the University of Delaware's health service. The appearance of flu-like symptoms after the seasonal strain had run its course prompted officials to send samples to state laboratories, which confirmed the new virus was on campus.

"This was a time when everyone was anxious about the disease," recalls E.F. Joseph Siebold, director of the university's health service. "Everyone was prepared for a worst-case scenario."

That scenario failed to materialize. The Centers for Disease Control and Prevention said last week that about 55 million Americans have been ill with H1N1 and about 11,000 have died—a far smaller toll than projected in a report last summer commissioned by the White House. That report warned of a scenario in which 60 million to 120 million people would become sick last fall and this winter and 30,000 to 90,000 people would die of swine flu.

So why were the initial swine-flu projections so far off the mark?

One possible explanation is that the early projections were fairly sound, but the CDC's latest tally of swine-flu cases is incomplete.

To arrive at its estimates, the CDC relies on the nation's patchy surveillance system. While broader than that of many other nations, U.S. health reporting isn't set up to catch every case.

The swine-flu estimates were based in part on the Delaware outbreak. Even as the university's health department beefed up staffing and issued early alerts, about half of ill students didn't bother to seek treatment. Those who did generally didn't have their cases confirmed by lab test.

In its analysis, the CDC attempted to address the gaps in the chain between illness and confirmation at the University of Delaware and in other outbreaks around the country. That led the agency to conclude that before July 23, just one of every 79 people believed to be infected with H1N1 who experienced symptoms had a positive test reported to the CDC. Once the CDC began discouraging tests for patients who weren't hospitalized, the agency instead extrapolated that each hospitalization represented 221 cases of swine flu.

Yet even with those assumptions, the CDC's calculations leave plenty of room for uncertainty, says Marc Lipsitch, an epidemiologist at the Harvard School of Public Health. Prof. Lipsitch was a co-author of last summer's report outlining the scenario of up to 90,000 deaths. Later, he conducted an independent analysis of swine flu's spread, using data from outbreaks in Milwaukee and New York. He determined that each hospitalization could represent as few as 70 overall cases, or as many as 600.

In all of the calculations, very large numbers are being estimated from very small ones. "For all of these steps, we used the data we had available to us," says David Swerdlow, a CDC epidemiologist. He adds that the estimates are "reasonable."

Delaware was chosen as a test case because it represented an isolated outbreak, and CDC investigators were on hand to help gather and analyze data. But a student population with on-campus health service might not behave like the general public.

Most countries aren't even trying to extrapolate swine-flu tolls from smaller samples. And figures from early outbreaks, particularly in Mexico, led to the high projections in the U.S. Prof. Lipsitch says that initially, "the data were limited and misleading and confusing."

This week, the World Health Organization said that at least 14,142 people had died of the flu world-wide – or just 3,000 more than the U.S. totals. But these figures aren't comparable. "WHO counts only laboratory-confirmed cases, but we understand this is a significant undercounting of the total," says spokeswoman Karen Mah.

These same challenges complicate efforts to count U.S. deaths from seasonal flu, which also is rarely confirmed by lab test. But there are key differences between the strains of flu and their death tolls. H1N1 has been killing much younger people. In a typical flu season, 90% of victims are 65 or older. Yet 88% of the new flu's victims were under 65.

On the other hand, death counts might overstate the burden of H1N1, which could be alleviating the toll from the typical seasonal flu. Some epidemiologists think the two flu strains may be competing, so that individuals who contract one type of flu aren't getting the other. That could explain why the seasonal flu has been very mild so far.

One piece of evidence: Fewer Americans in November and December told telephone pollsters from a near-daily Gallup/Healthways survey that they were sick with the flu the day before than did when asked the same question a year earlier.

The CDC numbers might be the best available, but they are far from certain. "You could put three statisticians in a room and get three different answers," says Jimmy Efird, a biostatistician at the Center for the Health of Vulnerable Populations at University of North Carolina, Greensboro. "Sometimes you're better off not trying to estimate something when it's difficult to model."

THE FLU CASE

WHO's Dr Chan to meet top pharma execs at "elite" forum in Davos, Switzerland

The Flu Case, 25 January 2010, 14:53

https://web.archive.org/web/20100220012844/http://www.theflucase.com/index.php?option=com_content&view=article&id=2622%3Awho s-dr-chan-to-meet-top-pharma-execs-at-qeliteq-forum-in-davos-switzerland&catid=41%3Ahighlighted-news&Itemid=105&lang=en
https://www.weforum.org/publications/world-economic-forum-annual-meeting-2010/

WHO's Dr Margaret Chan will be rubbing shoulders with the CEOs of Novartis, Sanofi-Aventis and Merck when she attends this year's World Economic Forum (WEF) in Davos, Switzerland, starting tomorrow. => http://www.weforum.org/en/index.htm

Daniel Vassella, CEO of Novartis, Chris Viehbacher, CEO of Sanofi-Aventis and Richard T. Clark Chairman, President and Chief Executive Officer of Merck will all be attending the forum which is believed to be used by the shadow government to plan how to acquire more power and set up a New World Order.

Along with David Rockefeller, Vassella also attended the last year's Bilderberg meeting close to Athens and listened to Swedish Foreign Minister Carl Bildt's talk on the need for WHO to be elevated to a global health ministry - and Bildt will be attending Davos too.

French President Nicolas Sarkozy, Mexican President Felipe Calderon (remember the swine flu outbreak in Mexico in April?), Baroness Ashton, High Representative for Foreign Affairs and Security Policy, Council of the European Union, David Cameron George Osbourne, David Milliband will also be going to Davos.

The foot soldiers of the New World Order will be gathering on Tuesday evening in the swish Hotel Belvedere to hear a welcome speech from Klaus Schwab, WEF founder.

Klaus Schwab – the Prince Philip of Switzerland, passionate about nature but not so passionate, it would appear, about human beings -- hinted this year's meeting for the world's power elite was a defining moment.

The theme of this year expressed in Orwellian doublespeak is "Improve the State of the World: Rethink, Redesign, Rebuild" .

In fact, the elite's plan to use the UN and WHO as vehicles for world government have fallen apart under revelations of the climate gate scam and the swine flu scam, and they will have much improvising to do.

Pandemics, viruses and the way the "traditional media" has been decimated by the rise of "citizen journalists" and "free online content" are topics the elite will be chewing over during the sessions in the remote Swiss ski resort.

Over 2,500 members from over 90 countries representing business, government and civil society, the Bilderbergs and composed of some of the top-level freemasons will discuss "pressing challenges" at the forum which is sponsored by the likes of Goldman Sachs and JP Morgan Chase, specifically the challenge of averting a downpour of lawsuits and other actions.

"We must look at the Meeting in the context of what's happening in the world and we see that the present system of global cooperation is not working sufficiently," said Klaus Schwab.

The WEF also launched the Global Health Initiative (GHI) in 2002 and works with partners such as Eli Lilly, Merck & Co., Pfizer as well as UNAIDS, WHO, UNICEF and the World Bank.the Bill and Melinda Gates Foundation, the ExxonMobil Foundation, the Foundation for AIDS Research (amfAR), the Open Society to deliver "vaccines" to developping countries under campaigns such as the Stop TB Partnership, Roll Back Malaria.

To do their part in the toxic swine flu vaccination campaign, the WEF insisted on all staff having the jab.

"*They also had an insightful conversation with Margaret Chan, the Director-General of the World Health Organization, on scenarios for a potential global pandemic*."

[WEF, 2010, p. 17] https://www3.weforum.org/docs/WEF_AnnualReport_2009-10.pdf

HUFFPOST WORLD

Niko Kyriakou

Swine Flu Didn't Fly

Huff Post, 27 January 2010
https://web.archive.org/web/20110512011808/http://www.huffingtonpost.com/niko-kyriakou/swine-flu-didnt-fly_b_438783.html
https://truthout.org/articles/swine-flu-didnt-fly // http://deepjournal.com/p/43/a/en/2527.html

For makers of the swine flu vaccine, 2009 was a year to remember. By June, CSL Limited's annual profits had risen 63 percent over 2008. GlaxoSmithKine's 2009 earnings spiked 30 percent in the third quarter alone, to $2.19 billion. Roche made a stunning 12 times more in the second quarter of 2009 than of 2008. But in 2010, drug companies may get their comeuppance.

On Tuesday, the Council of Europe launched an investigation into whether the World Health Organization "faked" the swine flu pandemic to boost profits for vaccine manufacturers. The inquiry, held in Strasbourg, France, vindicates a worldwide movement of insiders, experts, and elected officials who accuse the United Nations organization of misleading the world into buying millions of unnecessary vaccines.

"I have never heard such a worldwide echo to a health political action," Dr. Wolfgang Wodarg, an epidemiologist who formerly led the health committee for the Council of Europe, said at Tuesday's hearing.

Dr. Ulrich Keil, director of the WHO's Collaborating Centre for Epidemiology, hammered his own organization and WHO's flu chief, Dr Keiji Fukuda, for "producing angst campaigns".
"With SARS, with avian flu, always the predictions are wrong...Why don't we learn from history?" Keil said. "It [swine flu] produced a lot of turmoil in the pubic and was completely exaggerated in contrast with all the really important matters we have to deal with in public health."

Last year the World Health Organization predicted that H1N1 could infect two billion and claim hundreds of thousands of lives, while President Obama's science advisers said the outbreak could infect up to 120 million Americans and kill 90,000. But thankfully, H1N1 turned out to be a mild flu. The type-A influenza has taken around 14,000 lives worldwide, according to World Health Organization numbers from January 22. The CDC said in December confirmed US deaths had reached 4,000, although it recently estimated that due to underreporting, the true death toll could be as high as 16,500 - a tragic sum, but less than half of what the CDC attributes to seasonal flu-related illness. In most of the northern hemisphere, hog flu has been on the decline for some about three months. New transmissions are largely contained to North Africa and South Asia, according to the WHO.

Signs swine flu wasn't much of a killer grew throughout 2009, but WHO and most domestic health agencies around the globe chose instead to man the war bugles at full volume. The result was that governments poured tens of billions of dollars into vaccines. The US alone has spent $2 billion on the drugs and has allocated $7.5 billion in supplemental spending for H1N1 preparedness.

With the disease basically over, however, countries are stuck with millions of unused doses. French and German governments have had to cancel millions of orders of the vaccines due to falling demand and late-breaking news that European health authorities had recommended twice the necessary dosage. The CDC has dealt with the glut in another way. It now says all Americans should go and get the shot - a shift from its earlier recommendation that at-risk groups such as the young, sick, pregnant, and nurses seek injections first. But why should everyone get a shot when that the disease is petering out?

On January 22, WHO issued a statement calling allegations that it irresponsibly stoked H1N1 fears, "scientifically wrong and historically incorrect." The statement defends figures WHO publicized on transmission rates, mortality, and the virulence of swine flu. – "The world is going through a real pandemic. The description of it as a fake is wrong and irresponsible. We welcome any legitimate review process that can improve our work."

At the hearing, WHO's flu director, Dr Keiji Fukuda, denied the accusations against WHO. – "Let me state clearly for the record - the influenza pandemic policies and responses recommended and taken by WHO were not improperly influenced by the pharmaceutical industry."

Previously, WHO had offered scant response to allegations of corruption, but deigned to defend itself after the Council of Europe meeting was announced. The public meeting to examine accusations against WHO was set up by the Parliamentary Assembly of the Council of Europe (PACE), which represents 800 million people in 47 countries. The Council's January 26 meeting involved WHO officials, European drug-makers, and medical experts. PACE's findings are expected to be announced January 29 and will likely be followed by an in-depth study and recommendations to European governments.

The hearing is just latest in a series of investigations into WHO's propriety, which also include a 2009 Danish Parliamentary review of links between WHO expert - Albert Osterhaus - and makers of the swine flu drugs. Russian lawmaker Igor Barinov has also started an inquiry into WHO's ties to H1N1 drug makers. In France, Health Minister Roselyne Bachelot was forced to a Paris court on January 4th over swine flu campaign irregularities - including ordering millions unnecessary vaccine doses. Demonstrations over statistical improprieties have taken place in Scotland and Canada.

Inquiries into WHO misdoing are likely to plunge deep into the statistical methods for data collection, however, it takes no expertise to see that health agencies' data about H1N1 was wildly misleading.

In addition to bad guesses about how many would die, a study released December 7 by the Harvard School of Public Health found that the WHO also estimated the deadliness of H1N1 to be 40 to 250 times higher than it was.

Proving the drug industry squeezed WHO into selling swine flu is very difficult to establish, but the string of clues which points to this corruption is not hard to follow.

Pandemic or just plain Panic?

Swine flu took center stage in June of 2009, when WHO declared H1N1 the first "pandemic" in 42 years. This move caught the eye of every health authority from Tampa to Timbuktu and revved drug company engines. But to do it, WHO had to redefine the word.

One month after swine flu appeared in April, WHO rewrote the definition of "pandemic". Under the new meaning, a pandemic does not need to cause high numbers of death or illness. A month after changing the definition, with just 144 people dead from H1N1, the flu was given the WHO's highest threat classification: a "stage-six pandemic alert". By comparison, the mildest 20th Century pandemic killed a million people.

Before the change, WHO had classified a pandemic as a disease that has "simultaneous epidemics worldwide with enormous numbers of deaths and illness." After the alteration, the organization's website stated that, "Pandemics can be either mild or severe in the illness and death they cause." In May, WHO spokesperson Natalie Boudou told CNN that the original definition was an error.

The Los Angeles Times writer Michael Fumento called the redefinition "bizarre". "Such a declaration could render the term "flu pandemic" essentially meaningless -- risking lethal public complacency if a bona fide one hits," Fumento wrote.

Tom Jefferson, Formerly a general practitioner in the British Army who has worked for the well-respected Cochrane Collaboration for 15 years, Jefferson asked in July: "Don't you think there's something noteworthy about the fact that the WHO has changed its definition of pandemic?"

"The WHO and public health officials, virologists and the pharmaceutical companies... They've built this machine around the impending pandemic," Jefferson told Der Spiegel, a German magazine with a weekly circulation of 1 million. "There's a lot of money involved, and influence, and careers, and entire institutions. And all it took was one of these influenza viruses to mutate to start the machine grinding."

Yet the WHO stands by its decision to label H1N1 a pandemic, citing geographic spread and the virus' novelty as its primary reasons. Moving ahead, Fukuda said his organization "will definitely consider whether we can define things better." But some participants in Tuesday's meeting wondered what the WHO is waiting for, since complaints have poured in from all sides.

The Associated Press reported on May 19, 2009, that China, Britain, Japan and other countries had urged WHO to "be very cautious about declaring the arrival of a swine flu pandemic, fearing that a premature announcement could cause worldwide panic and confusion."

Critics say what was needed was not a frightful label, but hard scientific data to show how many people were getting swine flu. But on July 10, the WHO quit tracking cases of infection and told governments they should stop testing for individual cases, ostensibly because the speed of H1N1's spread had already been confirmed.

"Rational scientific independent advice should be supreme, but there was an imperative behind this which was a financial one," said Paul Flynn, a parliamentary representative in the UK who spoke at the Council of Europe's hearing.

Corruption in Health Organizations?

Critics of the WHO say they promoted bad data to help drug makers get rich selling vaccines. This attack implies drug makers have a network of influence within the decision-making structure of the organization, a suggestion various officials confirm.

One high-level, long-term WHO employee who preferred to remain anonymous for job security, described the WHO as follows: "WHO is infested by corruption. There is big corruption, like the management of H1N1, and there is small corruption; and between the big and the small corruption there is [corruption] in all imaginable forms. Unfortunately, it's not only the WHO."

William Aldis, a retired senior WHO official who worked on the bird flu crisis, said in a Huffington Post article from September 24: "I am concerned WHO's communications is corrupted by the fact they push the buttons in the public's brains that will raise the most funds. That is incompatible with what the organization should be doing: serving the public with technically correct factual information, pure and simple."

Louise Voller, a journalist at the Danish Daily Information newspaper, has reported that pharmaceutical companies are present at meetings of WHO experts, and, that purportedly independent scientists hired by the WHO are also consultants to the drug companies that make the vaccines.

On Tuesday, WHO's Fukuda insisted that its swine flu scientists' were not tainted by their private sector associations. The reason, he said, is that before each meeting, scientists are asked to declare all possible conflicts of interest. "These documents are gone over and examined. If there is some potential conflict of interest we go back and talk with them."

WHO was initially set up to rely on funding from UN member countries, in recent years, this source has been rapidly overtaken by "voluntary contributions", which are provided by the private sector, national governments, and NGOs. According to WHO's 2008-2009 budget, $958 million was supplied by the UN, while three times as much - $3.2 billion - came from voluntary donations.

Dr. Wodarg told the Council on Tuesday that the shift towards public-private partnership which began in earnest in 2001 puts WHO officials under extreme pressure. "Already then there were very critical voices against the influence. [WHO's] administration is made of people not well paid who can't fight against the pay of people in and from the industry – they are simply swept aside...

[private] influence is rampant and that is why we can't understand why the WHO we used to love...has become unrecognizable to us."

Whether or not WHO officials are being bought off, clearly, the capacity and incentive of drug makers to lean on science are enormous.

Pandemic Profit

All US contracts for H1N1 vaccines went to just five companies: CSL Limited, Novartis, Sanofi Pasteur, GlaxoSmithKline, and MedImmune. All five also produced shots for either SARS or avian flu. When swine flu took full flight in the third quarter of 2009, these firms' earnings skyrocketed. But according to British MP, Paul Flynn, that was part of drug-makers plan.

Prior to winning any contracts, drug makers invested $4 billion in preparations for swine flu, he said. That investment may have gone to developing and patenting new, super-fast methods to create vaccines, such as using a bio-reactor to grow viruses, said Dr. Wolfgang Wodarg, former health expert for the Council of Europe. These patents were key to drug industry profits, since companies can charge much more for patented drugs than un-patented ones, Wodarg said.

"If you have a patent you can monopolize...and this is what industry did...The alternative is not to have vaccines patented...By decentralizing the production you could be as fast and you wouldn't have this small way you have to pass negotiating with one enterprise that has monopoly, or with four enterprises."

Food and Drug agencies in Canada, the UK, France, the US and elsewhere guaranteed vaccine manufacturers that they would be shielded from any lawsuits connected to the vaccines. This enabled companies to fast-track the testing process, reducing some trials to as little as 5 days.

Wodarg and others have also voiced concern that the hastily developed vaccines are not entirely safe. Adjuvanted vaccines, which contain a kind of immune booster shown to produce auto-immune responses in some children, were sold in parts of Europe and Canada, but banned in the US.

The private research group, Markets and Markets, estimated that the global, H1N1 vaccine market will be worth over $7 billion a year by 2011.

The incredible profits associated with outbreaks have sparked a wider shift in medicine from care to profit, according to Marcia Angell, M.D., former editor in chief of The New England Journal of Medicine and a senior lecturer at Harvard Medical School.

"Over the past two decades the pharmaceutical industry has moved very far from its original high purpose of discovering and producing useful new drugs. Now primarily a marketing machine to sell drugs of dubious benefit, this industry uses its wealth and power to co-opt every institution that might stand in its way, including the US Congress, the FDA, academic medical centers, and the medical profession itself."

Angell reports that the drug industry spent around 14 percent of sales profits on research and development in 2000, while spending closer to 35 percent on "marketing and administration". How that expenditure breaks down is not public knowledge, but 35% comes out to a lot of money. For instance, Pfizer, GlaxoSmithKline, and Merck alone made $287 billion in 2007, according to the 2008 Pharma Report by IMS, a market intelligence firm.

The larger question begged by health agencies' bad data, and the media's dutiful reporting of it, is this: if fears are overstated every time there's a flu outbreak, when the public really does need a vaccine, who will believe the boys who cried wolf?

What's more, should the European investigations conclude that the WHO deliberately incited H1N1 paranoia to levels beyond reason in order to help drug makers, the implication is that both the private and public sectors need better oversight before being given any greater control over health care.

The Sydney Morning Herald

UN chief calls for treaty to prevent cyber war

The Sydney Morning Herald, 31 January 2010, 5:16 am
https://www.smh.com.au/world/un-chief-calls-for-treaty-to-prevent-cyber-war-20100131-n5t7.html

The world needs a treaty to prevent cyber attacks becoming an all-out war, the head of the main UN communications and technology agency warned Saturday.

International Telcommunications Union secretary general Hamadoun Toure gave his warning at a World Economic Forum debate where experts said nations must now consider when a cyber attack becomes a declaration of war.

With attacks on Google from China a major talking point in Davos, Toure said the risk of a cyber conflict between two nations grows every year.

He proposed a treaty in which countries would engage not to make the first cyber strike against another nation.

"A cyber war would be worse than a tsunami – a catastrophe," the UN official said, highlighting examples such as attacks on Estonia last year.

He proposed an international accord, adding: "The framework would look like a peace treaty before a war."

Countries should guarantee to protect their citizens and their right to access to information, promise not to harbour cyber terrorists and "should commit themselves not to attack another."

John Negroponte, former director of US intelligence, said intelligence agencies in the major powers would be the first to "express reservations" about such an accord.

Susan Collins, a US Republican senator who sits on several Senate military and home affairs committees, said the prospect of a cyber attack sparking a war is now being considered in the United States.

"If someone bombed the electric grid in our country and we saw the bombers coming in it would clearly be an act of war.

"If that same country uses sophisticated computers to knock out our electricity grid, I definitely think we are getting closer to saying it is an act of war," Collins said.

Craig Mundie, chief research and strategy officer for Microsoft, said "there are at least 10 countries in the world whose internet capability is sophisticated enough to carry out cyber attacks ... and they can make it appear to come from anywhere."

"The Internet is the biggest command and control centre for every bad guy out there," he said.

The head of online security company McAfee told another Davos debate Friday that China, the United States, Russia, Israel and France are among 20 countries locked in a cyberspace arms race and gearing up for possible Internet hostilities.

Mundie and other experts have said there is a growing need to police the internet to clampdown on fraud, espionage and the spread of viruses.

"People don't understand the scale of criminal activity on the internet. Whether criminal, individual or nation states, the community is growing more sophisticated," the Microsoft executive said.

"We need a kind of World Health Organisation for the Internet," he said.

"When there is a pandemic, it organises the quarantine of cases. We are not allowed to organise the systematic quarantine of machines that are compromised."

He also called for a "driver's license" for internet users.

"If you want to drive a car you have to have a license to say that you are capable of driving a car, the car has to pass a test to say it is fit to drive and you have to have insurance."

Andre Kudelski, chairman of Kudelski Group, said that a new internet might have to be created forcing people to have two computers that cannot connect and pass on viruses. "One internet for secure operations and one internet for freedom."

THE FLU CASE

"We need a World Health Organisation for the Internet", says Microsoft executive at Davos

The Flu Case, 2 February 2010
https://web.archive.org/web/20100220013344/http://www.theflucase.com/index.php?option=com_content&view=article&id=2684%3Aqwe-need-a-world-health-organisation-for-the-internetq-says-microsoft-executive-at-davos&catid=41%3Ahighlighted-news&Itemid=105&lang=en

"We need a kind of World Health Organisation for the Internet," a Microsoft executive at the World Economic Forum in Davos – attended by WHO's Director General Dr Margaret Chan – has said.

"When there is a pandemic, it organises the quarantine of cases. We are not allowed to organise the systematic quarantine of machines that are compromised," said Craig Mundie.

His call for a new system of control over the internet were backed by UN communications and technology agency.

No wonder.

Information about the UN's climate change scam and WHO's swine flu scam spread like lightening thanks to the internet, derailing the move to a one world government controlled by the international corporate "elite" and to be implemented with a simultaneous programme of depopulation using soft kill vaccines – and all this behind the smokescreen of misinformation spread by the controlled media.

The internet has proved to be extremely flexible and to be able reconfigure itself to channel information about the crimes of the new world order "elite", and it will continue to transform and adapt.

THE FLU CASE

Richard Creecy

Swindled by swine flu scare

The Flu Case, 4 February 2010 14:15

https://web.archive.org/web/20100415040859/http://www.theflucase.com/index.php?option=com_content&view=article&id=2692%3Aswindled-by-swine-flu-scare-by-richard-creecy&catid=1%3Alatest-news&Itemid=64&lang=en

We heard the warnings last fall about the newest threat for Americans. A plague was predicted to descend on us all as if we had told Moses where his people could stick it. But the H1N1 virus, better known as swine flu, did not bring about widespread death and panic. And as the dust settles from the media fueled panic, the true facts about this supposed pandemic start to emerge.

According to the Centers for Disease Control and Prevention, the H1N1 virus is a type of influenza virus. Its symptoms are virtually identical to that of the seasonal flu, with the exception of certain respiratory complications which infrequently occur. Both of the viruses are contagious person-to-person in similar ways. In fact, the reason why this type of flu virus has the nickname "swine flu" is that the H1N1 virus is genetically similar to the type of flu that occurs in pigs in North America. Humans, as hapless incubator tubes, are left with a disease that looks like the flu, spreads like the flu and is easily treatable, like the flu.

But are students, or any other Americans really at risk from this up and coming pestilence? Let's look at the statistics. There have been 405,140 confirmed cases of the H1N1 virus in the U.S. to date, with 4,545 fatal cases. That does not sound too scary considering there are 304,059,724 people living in America, which means that this disease has affected .13 percent of all Americans. Of the .13 percent of Americans who caught the disease only 1 percent ended in death. To put those numbers into perspective, you have the same statistical percentage chance of dying from H1N1 than you do from being crushed or eaten by a non-venomous reptile in the continental United States. So unless you wrangle pythons or alligators at a zoo, it seems as though most people are relatively safe from catching the H1N1 flu.

Now I am not marginalizing the people that have been affected by this disease, or the families of the people who have died. What I am saying is the hype around the "deadly new" H1N1 disease is just that – hype. Remember when bird flu, aspartame and drinking from reused water bottles brought humanity to a grinding halt? Neither do I. This is another example of what some people call a "slow news day," when the media powers that be grab something innocuous and cram it down our collective throats, whipping everyone into a panic.

The result of all this media attention is evident in our society, as disinfectant sprays start boosting the H1N1 killing power and relatively untested vaccines start getting handed out like candy. According to the Centers, 800,000 units of the vaccine designed for infants ages 6-35 months have been recalled. The recall was due to instability issues with the batches. The vaccine may also be linked to Guillain-Barre Syndrome, an extremely rare auto-immune disorder that normally affects roughly one or two in 100,000 Americans.

The H1N1 flu campaign has seemingly caused more trouble than the actual disease. With schools closing and fearful parents inoculating their children with a vaccine that might cause a worse disease, it would seem that fear caused as much damage as the disease. The next time you hear about the new super bug or other sinister threat descending upon America remember this: what does not kill you, makes you stronger.

UK Parliament

Baroness Thornton

Swine Flu: Statement

UK Parliament, 4 February 2010
https://hansard.parliament.uk/lords/2010-02-04/debates/fbca7e23-07a8-402a-8b00-173e7ed204e7/WrittenStatements

My honourable friend the Minister of State, Department of Health (Gillian Merron) has made the following Written Ministerial Statement.

With the global spread of the swine flu virus, the World Health Organization declared a pandemic on 11 June 2009. In response to increasing pressures on front-line National Health Service and social care services, the National Pandemic Flu Service (NPFS) was activated on 23 July 2009. This was to provide a self-care service for people to assess their symptoms and, if necessary, to access antiviral medicines rapidly from antiviral collection points.

The department is today announcing the decision to stand down the NPFS with effect from 1 am on 11 February 2010. This is being done in response to the steady reduction in the estimated number of swine flu cases in the community, and is in line with our overall aim of ensuring that the operational response is appropriate to the level of threat posed by the virus. General practitioners and primary care trusts have indicated that they can now manage the clinical caseload themselves. As we did with the launch of the NPFS, we are now standing it down with the full support of the key professional bodies (the Royal College of General Practitioners – RCGP – the British Medical Association – BMA – and appropriate pharmacy organisations).

We will continue to monitor the spread of the swine flu virus, and, should it become necessary, the NPFS can be re-activated in seven days. Anyone who suspects they have swine flu from 11 February will be advised to contact their doctor for assessment of their symptoms; the doctor will issue an antiviral authorisation voucher if needed. For the time being, antivirals will continue to be collected through antiviral collection points. People with swine flu should ask their flu friend to collect their antivirals on their behalf. Antivirals will continue to be issued to patients with swine flu symptoms, under this system, free of charge until at least the end March 2010, the end of the seasonal flu period.

Many people have felt reassured by the fall in disease incidence, and the relatively mild illness that has characterised most people's infections. Deaths, however small relative to previous pandemics, are tragedies for families and vaccination could help avoid them. The current vaccination programme is continuing and we must remain vigilant. We have therefore asked GPs to make further contact with people in the priority groups who are at higher risk from the disease and who have not yet had the vaccine. These include individuals aged over six months and in the seasonal at-risk groups; pregnant women; those who live with immuno-compromised individuals; and children aged over six months and under five years and eligible front-line health and social care workers. Good progress has been made in delivery of the vaccination programme to date but we must not be complacent. It is important that people in these groups continue to receive the vaccine, as it offers the best protection against the virus.

I would like to record my thanks to all those involved in setting up and running the NPFS. It has broken new ground in healthcare delivery and has played an important role in our response to the swine flu pandemic. With the support of the RCGP, the BMA, and the pharmacy organisations, the NPFS has been very successful in easing pressure on primary care services during the busiest times of the pandemic, allowing GPs to focus on those most ill and ensuring high volumes of people get access to antiviral medicines, when they need them.

MailOnline

Jenny Hope

It's official, the swine flu 'pandemic' is over (shame it cost us £1billion and scared thousands witless)

Daily Mail, 4 February 2010, 23:29 GMT
https://www.dailymail.co.uk/news/article-1248473/Swine-flu-panic-national-website-helpline-shut-down.html

The swine flu pandemic, which has cost the nation more than £1billion, was declared over yesterday.

With the number of new cases plummeting, health chiefs announced the 24-hour flu helpline will close down next Thursday.

Critics said the seven-month outbreak had been mishandled by ministers and health officials, who had made a flawed assessment of the threat.

Swine flu has killed 411 Britons, with 124 more still in hospital - yet the 5,000 cases a week are far below the average for seasonal flu.

Chief Medical Officer Sir Liam Donaldson had warned the pandemic might claim 65,000 lives and Health Secretary Andy Burnham said 100,000 could be struck down with the disease every day.

Total cases stand at 800,000 so far. Around the world, an estimated 14,000 deaths have been reported - a fraction of the number dying each year from ordinary flu.

The Government is thought to have ordered tens of millions of doses of vaccine.

So far only 4.25million have been administered to priority groups in England.

Sir Liam is still urging the vulnerable to have the jabs.

He insists the vast cost of tackling the pandemic has been justified, from the £1billion cost of vaccines and antivirals to the £10.4million spent on publicity.

The National Pandemic Flu Service, which cost a further £13.5million to run, allowed patients to bypass their GP and collect antiviral drugs after a telephone assessment.

Launched in July last year and employing 1,500 call centre staff, it led to 1.1million courses of antivirals being administered to patients - many of whom never had swine flu, according to research.

Anyone suspecting they have swine flu can still get antiviral drugs from their GP, while those in at-risk groups, including children under five, can receive a vaccination.

Sir Liam said: 'When the virus returns I would very much like to see young children already protected.

'From now on, most deaths from the pandemic flu virus should be regarded as potentially preventable.'

WHAT THEY SAID

Health Secretary Andy Burnham:

"Cases are doubling every week and we could see over 100,000 cases per day by the end of August"

July 2 2009

Chief Medical Officer Sir Liam Donaldson

"The NHS is planning for up to 65,000 deaths as a reasonable worst case scenario"

July 16 2009

BY NUMBERS

£1bn spent by UK on vaccine, antivirals and other drugs

£13.5m spent on the telephone call service

132m vaccine doses ordered by the Government

4.25m doses administered

140,000 pregnant women vaccinated

800,000 swine flu cases reported

411 deaths in Britain so far

13 deaths in pregnancy

23 deaths among children

30% of victims had no underlying health problems

29 patients still in critical care

£4bn estimated windfall profits for drug firms

A spokesman for the Department of Health said: 'Our priority remains to vaccinate those most at risk from swine flu, as people are still in hospital from the virus.

'This is the first time we have had a vaccine to protect people while a pandemic virus has been circulating, so it has undoubtedly helped us save lives.'

However, the bumper revenues being reported by vaccine manufacturers - £4billion in windfall profits is predicted - have led to claims that the World Health Organisation fell under the influence of the industry when it declared a pandemic last June.

Matthew Elliott of the Taxpayers' Alliance said: 'The Government's reaction to swine flu has proved to be excessive and poorly managed.

'It beggars belief that they could have signed so many massive contracts with such a flawed assessment of the threat.'

But John Oxford, professor of virology at Bart's and The London Hospital, defended the flu strategy.

'Swine flu is behaving in a classic Darwinian fashion – the survival of the fittest – and has already displaced 98 per cent of the other flu viruses,' he said.

'My worry is that when it gets into the elderly next year, we could see many more deaths.

'We should be proud that Britain responded in a way that prevented many more cases and deaths.'

INFORMATION LIBERATION

UK to shut down National Pandemic Flu Service

Information Liberation, Daily Mail, 4 February 2010, 1:24 PM
https://www.informationliberation.com/?id=28800
https://web.archive.org/web/20100211124236/http://www.theflucase.com/index.php?option=com_content&view=article&id=2691:uk-to-shut-down-national-pandemic-flu-service&catid=1:latest-news&Itemid=64&lang=en

The National Pandemic Flu Service will be stood down in response to the 'steady reduction' in the number of cases of swine flu, it was announced today.

In what will be interpreted as a sign that the outbreak in Britain is largely over, the flu hotline and website will be switched off on February 11.

Cases have been falling steadily and most people who have become ill have suffered relatively mild illness, although Sir Liam Donaldson, the Chief Medical Officer, has warned against complacency.

Health Minister Gillian Merron said the NPFS could be re-activated in seven days should it be needed.

People who suspect they have swine flu will be directed to their GP instead of the antiviral collection points from next week, she added.

In a written ministerial statement to MPs, Ms Merron said: 'The Department is today announcing the decision to stand down the NPFS with effect from 1am on February 11 2010.

'This is being done in response to the steady reduction in the estimated number of swine flu cases in the community and is in line with our overall aim of ensuring the operational response is appropriate to the level of threat posed by the virus.'

Ms Merron said GPs and Primary Care Trusts (PCTs) were now able to manage the swine flu caseload themselves and the decision to close down the service was taken with the 'full support' of the professional bodies.

She said people had felt 'reassured' by the fall in the numbers of patients getting the illness but warned: 'The current vaccination programme is continuing and we must remain vigilant.

'We have therefore asked GPs to make further contact with people in the priority groups who are at higher risk from the disease and who have not yet had the vaccine.'

These included children between six months and five years, pregnant women, those with compromised immune systems and frontline health workers.

She added: 'Good progress has been made in delivery of the vaccination programme to date but we must not be complacent.

'It is important that people in these groups continue to receive the vaccine as it offers the best protection against the virus.'

Figures released last month showed the number of cases of swine flu remained below 5,000 for three weeks in a row.

A total of 3.7 million priority groups in England have been vaccinated, including 132,000 pregnant women and 214,000 children aged from six months to five years, according to the Department of Health's figures.

But in a letter to the NHS last week Sir Liam warned: 'It is extremely important that we do not allow the current low levels of influenza-like illness and the stand-down of the NPFS to lead to a sense of complacency.

'There is still considerable uncertainty about how the virus will behave over the coming months and years.

'Experts advise us that it is likely that pandemic H1N1 (2009) will be the predominant flu virus in the 2010 influenza season. The 2010 season may come earlier than usual and there may be outbreaks sparked by returning travellers from countries affected by the Southern Hemisphere flu season which starts quite soon.

'There is also a risk that the genetic composition of the pandemic H1N1 (2009) virus will "drift" during its passage through the world and return to the United Kingdom to cause a more severe illness.'

SWI swissinfo.ch

Fin de la pandémie de grippe A/H1N1

SwissInfo Ch, 5 February 2010, 18:55

La pandémie de grippe porcine arrive à son terme en Suisse, a annoncé l'Office fédéral de la santé publique. Les activités de l'office vont reprendre leur "courant normal". Le virus H1N1 a tué 18 personnes.

Depuis le pic de la pandémie en décembre, le nombre de cas de personnes ayant contracté la grippe porcine diminue constamment. Le virus est toujours actif, mais la pandémie arrive à sa fin, a indiqué Patrick Mathys de l'OFSP.

Environ 1,3 million de personnes se sont fait vacciner en Suisse contre la grippe porcine, a indiqué de son côté Virginie Masserey, directrice de la section vaccins de l'OFSP. C'est approximativement le même chiffre que pour les vaccinations contre la grippe saisonnière.

"Nous levons les mesures de crise", a-t-elle ajouté. Une évaluation externe est actuellement en cours d'élaboration.

Selon les chiffres à disposition de l'OFSP, 561 personnes ont été hospitalisées à cause de la grippe porcine. Le chiffre réel est certainement plus élevé, estime l'office. Une centaine de malades ont été traités au soins intensifs. Il y a eu 18 victimes.

THE FLU CASE

Swiss government says swine flu pandemic almost over

The Flu Case 8 February 2010 15:00

Government health officials in Switzerland have said that swine flu pandemic is coming to an end in the country after peaking in December.

The swine flu virus killed 18 people, according to the official statistics.

Virginie Masserey, director of vaccines at the Federal Office for Public Health, estimated that 1.3 million people in Switzerland took the jab.

The New York Times

Donald G. McNeil Jr.

Most Americans think Swine Flu Pandemic is Over, a Harvard Poll Finds

New York Times, 6 February 2010
https://www.nytimes.com/2010/02/06/health/06flu.html

Most Americans do not intend to get the swine flu vaccine, assume the pandemic is over and think the flu threat was overblown, according to a poll released Friday by the Harvard School of Public Health.

As of the end of January, only about a fifth of all Americans had had swine flu shots, according to that poll and data released separately by the Centers for Disease Control and Prevention.

And, even though this flu hit children and teenagers the hardest, only about 40 percent of them have had the shots. That figure could improve because 13 percent of adults surveyed by Harvard told pollsters that they still intended to get their children vaccinated. If they do so, slightly more than half of all the country's children will have been vaccinated, though many young ones who should have had two shots got only one.

Most parents who did not get shots said they felt the threat had passed. The second-most-common reason was fear of the vaccine, even though monitoring of the first 60 million doses showed no unusual rate of side effects.

"A steady core of adults" has resisted all warnings and appeals from public health officials, said Robert J. Blendon, director of opinion research at Harvard's School of Public Health, which has done several polls with C.D.C. financing since the outbreak began.

Michael T. Osterholm, director of the Center for Infectious Disease Research and Policy at the University of Minnesota, said he "was not surprised" by how few got shots.

"But that could all change overnight if we get a third wave in late February — and we still could," he added. "That would make this half-time data, not end-of-the-game data."

Dr. Anne Schuchat, the C.D.C.'s director of immunization and respiratory disease, who in early January urged all Americans to get shots because they had finally become plentiful, put a brave face on the low figures, saying she was "encouraged" because more children got shots than ever previously got regular flu shots and because many got them at school for the first time. If that became routine, it could lead to much wider flu protection because schoolchildren often are the vectors that infect their families.

"I, of course, hope we can do better in future years," Dr. Schuchat said.

Across the country, flu activity is below normal for this time of year, she said, although hospitalizations and deaths continue. Nine children died of confirmed swine flu in the last week of January, according to weekly data released Friday. The C.D.C. estimates that about 1,000 children have succumbed to it since April.

The new strain continues to “crowd out” seasonal flu this winter. Only 2 out of 119 samples subtyped were not swine flu, according to the agency’s weekly FluView report.

The data contain one anomaly officials cannot explain: For the third week in a row, the proportion of all death certificates in the country listing pneumonia as the cause of death was well above normal. A week ago, New York City officials noted the same phenomenon, and they are investigating it.

Epidemiologists do not know what caused the pneumonia deaths, which are mostly in elderly patients. Most patients, even in hospitals, are never autopsied. Usually to find the cause of the pneumonia doctors must get a sputum sample to culture in a laboratory, which requires pushing a tube deep into a patient’s lungs. Doctors usually spare patients that ordeal and just keep changing antibiotics, hoping to find one that works. Over half the time, even lung samples grow out nothing that explains why a patient died.

What samples the C.D.C. knows of, Dr. Schuchat said, were routine germs like rhinovirus and respiratory syncytial virus.

The Harvard polling data was of 1,419 adults, including 377 parents, and had a margin of error of three percentage points for the total response. It found that 21 percent of those polled had been vaccinated, and 15 percent intended to by the end of February. Of the parents, 40 percent had had their children vaccinated, and 13 percent intended to.

The centers estimated that 23 percent of all Americans had been vaccinated, and 37 percent of all those under 18 had. It polled 4,110 people and said the margin of error was three percentage points for the estimate of all Americans vaccinated and seven percentage points for the estimate on children.

In Harvard’s poll, 59 percent rated the response by public health officials to the swine flu pandemic “good” or “excellent.”

More than three-quarters remembered seeing or hearing some sort of public health announcement urging them to get vaccinated.

WHO chair: flu advisers risk persecution
WHO-formand: Influenzarådgivere risikerer chikane
Translated by Ulla Danielson

Information, 7 February 2010, 21:35
http://www.information.dk/223866

De hemmelige H1N1 influenza-rådgivere risikerer chikane fra medicinalindustrien, hvis offentligheden kender deres identitet, siger formand for WHO-komité. Han afviser selv at være inhabil trods sine bånd til vaccineproducenter ...

The secret HI1N1 flu advisers risk persecution from the pharmaceutical industry if the public get to know their identity, says the chair of a WHO committee to the Danish daily newspaper *Information*. He denies that his links to the vaccine producers should disqualify him as advisor.

The names and financial interests of the H1N1 flu experts who were behind the decision of WHO Director General Margaret Chan to declare a pandemic emergency have until now been kept secret.

However, the name of the head of a key secret emergency committee has emerged, and it turns out, that the chair has financial links to several pharmaceutical companies. The professor himself, Dr. John Mackenzie, rejects that this should disqualify him.

What reasons are there to keep the names secret?

"Most committees in WHO are open but there are no reasons to fear pressure on them. When it comes to the emergency committee, there is reason to fear pressure from pharmaceutical companies. That's why it's a good idea to keep the names secret during the period where we have an emergency situation,"says the professor from University of Curtin in Australia, who is now in retirement.

Emergency committees are only established in the event of a potential threat against the interna-tionational public health on the decision of Director General Margaret Chan to whom such a committee also refesr directly. Accordingly, the H1N1 emergency committee was established on April 25, 2009, when several infected people and several deaths in Mexico and the USA created concern about a coming epidemic. The committee recommended that Margaret Chan declared a pandemic emergy on June 11th, a decision which triggered the implementation of existing contracts between vaccine producers and governments. Following this step the production of millions of vaccines started.

Necessary "keeping the names of the members secret is a good idea because it has to be avoided that they get to feel the ire of the producers of vaccines or other firms involved in the pandemic emergencies. When the pandemic is over, the names should be made public," that is the opinion of Dr John Mackenzie.

Transparency is also about making potential financial conflicts of interest public. Have you done that in the case of WHO?

"Every member of the emergency committee has to declare their potential conflict of interest to WHO. Personally I have not been involved with the pharmaceutical industry since the middle of the 1970's."

As chair for the Australian Society for Microbiology you have collaborated with pharmaceutical companies like Abbott, Biomérieux, Roche and Wyeth, who by means of sponsorships have permanent membership of the society. According to the homepage the industry gets “access to australia’s largest network of microbiologists” as well as “access to 20 groups of interest inside microbiology”?

“I personally have not received any money, therefore, I cannot see how I could be in a conflict of interest”.

On February 25th-28th, the 8th Asia Pacific Congress for Medical Virology is taking place. The meeting is sponsored by Glaxosmithkline, Biomérieux, Crucell, Roche, Sanofi-pasteur, Solvay Biologicals, all of whom produce vaccines and flu remedies. What is your role?

“I participated in the start of the organization. Today I am a member of the advisory board. But we have no contact to the people arranging the congress. And even if I took part in arranging the congress, it does not mean, that pharmaceutical companies have influence on me simply because they sponsor one of the speakers. Tere is no personal gain here,” says the professor and continues:

“It is precisely like conferences taking place inside any other industry. The companies sponsor in order to be allowed to expose their names. They have no influence on the activities going on.”

The same vaccine producers, who finance a congress that you arrange have contracts worth millions that are activated when WHO declares a pandemic. A decision you influence directly. Don’t you see a potential conflict of interest for you personally?

“It is important to underline that the emergency committee acts only as adviser to the Director General Margaret Chan. We have nothing to do with vaccines. Personally, I have not worked with vaccine producers for 30 years.”

No influence

How do you explain the secrecy surrounding the emergency committee in connection with your actual saying that the producers of vaccine have no influence?

“Particularly with the swine flu, there have not been so many producers of vaccine, and therefore there has been no great pressure on the committee. But in case a new unknown virus should appear, many pharmaceutical companies will try to market new pharmaceuticals, and accordingly the pressure on the committee will be enormous. Therefore it is sensible to ask for secrecy concerning the names of the members but the names will be published as soon as the pandemic is over.”

What is the status of the H1N1 pandemic?

“During the latest weeks it has seemed that the pandemic is flattening out in the northern hemisphere. We are still a little worried for the southern hemisphere because the flu season is approaching, and therefore we follow the events closely. Personally, I believe the pandemic is almost gone, but one of the problems with a virus like the flu is that it behaves in unexpected ways. Therefore we always have to expect the unexpected. Therefore, we maintain the same level of pandemic.”

THE FLU CASE

Head of key WHO Emergency Committee has links to Big Pharma, reports Information

The Flu Case, 23 February 2010, 16:14

https://web.archive.org/web/20100301040134/http://www.theflucase.com/index.php?option=com_content&view=article&id=2805%3Ahead-of-key-who-emergency-committee-has-links-to-big-pharma-reports-information&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Denmark's Information reports that the head of a secret emergency committee that advised WHO chief Dr Margaret Chan to declare a pandemic emergency level 6 on June 11th 2009 is a biosecurity professor at Curtin University in Australia, Dr John McKenzie, who has links with pharmaceutical companies.

Mackenzie has ties to vaccine manufacturers both in his capacity as chair of Australia's microbiology society and also as an organiser of congresses sponsored by Big Pharma.

The decision to declare a pandemic emergency level 6 triggered lucrative pandemic vaccine contracts that vaccine producers had sealed with governments.

The report also reveals;

* the emergency committee first convened on April 25th, just days after the first cases of the mild swine flu were first reported and even though only a handful of deaths had been attributed to the virus in Mexico and in the USA

* Mackenzie himself does not believe the swine flu virus is "new, unknown" virus, thereby undermining the reason for declaring a pandemic emergency in the first place

* that Mackenzie believes the members of the emergency committee would be subject to pressure from Big Pharma if there names were known, thereby indirectly confirming the influence of Big Pharma

SWC swine flu warning

News 24, 8 February 2010, 21:33

https://web.archive.org/web/20100212052110/http://www.news24.com/Content/SouthAfrica/News/1059/bc7224c9bbf348fdbe8d6726a681509b/08-02-2010-09-33/SWC_swine_flu_warning

Johannesburg - South Africans should not be complacent about swine flu ahead of the Fifa 2010 World Cup as it remains a grave worldwide health threat, Netcare Travel Clinics warned on Monday.

Dr Pete Vincent of the Netcare Travel Clinics said in a statement that the dangers of swine flu or the H1N1 virus, which has already claimed more than 14 700 lives around the world, should not be underestimated.

"The H1N1 virus could well make a big return to South Africa during our next flu season," he said.

"We will have a lot of people visiting the country over the period of the World Cup. Therefore, the conditions for a rapid spread of the virus will be good."

Evident in many countries

Vincent said that while the pandemic was now past its prime autumn and winter peak in many parts of the northern hemisphere, it was still evident in many countries.

He said as a result, South Africans should be ready for swine flu during the World Cup this winter.

Vincent's warning comes as the department of health planned an extensive swine flu vaccination drive of about a million people in March prior to the World Cup.

"The more people are vaccinated against the illness, the greater the protection afforded to the community and visitors to our country. Clinics and pharmacies will also stock the vaccine," Vincent said. "Those who intend travelling now or later in the year should also consider having the vaccination."

"One does not want to get sick while travelling and especially in places where you may not be able to get adequate medical support," Vincent said

WHO says swine flu threatens World Cup in South Africa

The Flu Case, 10 February 2010

https://web.archive.org/web/20100220013624/http://www.theflucase.com/index.php?option=com_content&view=article&id=2726%3Awho-says-swine-flu-threatens-world-cup-in-south-africa&catid=1%3Alatest-news&Itemid=64&lang=en

WHO and the International Football Federation (FIFA) say the mild swine flu virus could threaten the World Cup to be held in South Africa in June 2010 and WHO is urging people to take the swine flu jab, according to local media.

South Africa has already ordered 1.3 million doses of swine flu vaccines and WHO is to donate another 3 million doses for use during the World Cup.

The South African Government, WHO and theFIFA are working closely together on a vaccination strategy.

Swine Flu & Fake Epidemics: Medicalisation and the Push for Global Management

New Down, 10 February 2010

https://web.archive.org/web/20100509164259/http://www.newdawnmagazine.com/articles/swine-flu-fake-epidemics-medicalisation-and-the-push-for-global-management

The Council on Foreign Relations (CFR), headquartered in New York, is one of the key power centres pushing Globalism for All. As I've been writing for some time, medical programs are a clever and deceptive strategy for advancing this goal – the coagulation of Earth under one system of political management.

Global control is not a "right-wing" fantasy. It's an objective much like the European Union, only writ much larger. Gradually, through attrition, sovereign nations decay under a super-bureaucracy that makes all the rules, issues the currency, and, over time, runs a tighter and tighter ship.

The outer shell of the CFR, founded 90 years ago as a Rockefeller plantation of control, is made up mostly of pundits and funded fellows and business leaders and politicians who look and sound like pompous blowhards. Which they are.But behind this mask, the inner CFR core designs schemes that could draw us all under the umbrella of de facto international control.

On October 16, 2009, the CFR held a symposium titled: *Pandemic Influenza: Science, Economics, and Foreign Policy.*

Much of the information in this symposium report is window dressing. However, it's worth noting a few comments made by presenters:

"*Laurie Garrett***,** senior fellow for global health at the Council on Foreign Relations, said at the October 16, 2009 New York symposium that amid the array of unknowns surrounding the H1N1 virus, one certainty is that 'this is a worldwide event and it is occurring in the dawn of our age of globalisation.' Garrett added, 'It's a darn good thing we are dealing with a relatively mild flu this time, because clearly we are ill-prepared at this moment for a more virulent or more dangerous virus, either if this one takes on a more dangerous form… or if a second totally different virus does emerge.' *Helen Branswell* of the Toronto-based *Canadian Press* agreed: 'We thought we were preparing for a more serious (bird flu H5N1) issue, but we are in fact not prepared for a mild one." (Pandemic Influenza: Science, Economics, and Foreign Policy**,** Symposium Rapporteur Report, October 16, 2009, => https://web.archive.org/web/20091030094946/www.cfr.org/content/publications/attachments/LG_Pandemic_Symposium_101609_rapporteur_report.pdf

So two points were established early on: the Swine Flu is a mild disease, not a pandemic by any sensible definition; and leaders of "our age of globalisation" must be prepared for a more drastic disease event by taking worldwide measures now.

This latter issue is highlighted by another contributing CFR speaker:

"It was the overarching consensus of the symposium, first forwarded in the gathering by *Financial Times* correspondent **Andrew Jack** of London, that the current pandemic must serve as 'a teachable moment', focusing expert attention on the inherent contradictions in global governance of health issues, inequities in world access to vaccines and medical supplies, weaknesses in planning and management of epidemics with worldwide risks for economics and politics, and the public's respect for science and public health."

Andrew Jack thus punches up the notion that solutions to so-called global health problems can only be attained through international means.

Medical Crises and Global Governance

The report continues: "[Robert] Rubin [former US Secretary of the Treasury and Co-Chair of the CFR] noted that the increased global interdependency of the current economy has changed the game for pandemic responses in the United States, leaving only one option: 'If the United States, and the world global economy, is going to be moderately well-prepared for this, there has to be an enormous amount of planning and agreed-upon processes and regimen decisions *before* the [pandemic] hits'."

These speakers are talking about a *vast* system, a medical bureaucracy that can oversee planning and execution of "epidemic control" on a global scale.

Laurie Garrett then makes a pitch for equitable redistribution of wealth among nations:

"Moderator Garrett said: 'We have globalised [epidemic] risk and threat today, but not globalised benefits. So the whole world shares the risk of pandemic influenza, but only a small percentage share vaccines, medicines and treatments'."

Who would make those wealth-redistributing decisions from the top? Who would allocate money and drugs and vaccines and doctors from Greenland to Tierra Del Fuego? There is only one answer: an internationally organised body that could override the wishes of sovereign countries.

Then John Lange sounds a sour note of failure in this regard:

"In face of profound scientific and economic insecurities, important foreign policy decisions must be made by the United States to address the globalisation of pandemic *protection* and benefits, as well as threat. Ambassador **John E. Lange**, of the Bill and Melinda Gates Foundation and former Special Representative on Avian and Pandemic Influenza for the State Department, said international coordination in response to the H5N1 pandemic [another mild flu season] of the 1990s paved the way for today's response to H1N1. Nevertheless, Lange said, little has been done to move towards a more institutionalised global response, due as much to a lack of political will as to strained resources, in spite of high expectations."

Lange thus draws the problem. The US has lagged behind. The US is not eager enough for "a more institutionalised global response." The US doesn't want to cede power to some agency like the World Health Organisation (WHO).

Another speaker takes off the mask and drives home Lange's point harder:

"*Canadian Press*' Branswell doubted how feasible it will be for countries such as the United States and Canada to deliver on these expectations. At the heart of the debate is the issue of sovereignty, which may prevent states from carrying through with their agreements in the face of pandemic pressure, instead choosing to nationalise local supplies of vaccines, masks, protective gear and other medical supplies. Conversely, sovereignty has been invoked as the basis for refusing to share samples of dangerous flu viruses with WHO and international scientists, and for declining outside inspections of local outbreaks."

Surrendering National Sovereignty

Well, there it is. It doesn't take a genius to read between the lines. The surrender of national sovereignty is necessary if the world is going to deal with encroaching waves of pandemics. Nations will have to give up their independent status in these situations – and you can be sure that the international body formed to govern epidemic disease will be permanent. No one is stupid enough to think that the enormous effort and time and money needed to establish such a bureaucracy would fade away after the latest and greatest pandemic. Control would transfer now and in the future.

Medical crises, in this way, translate into further steps along the way to global governance.

Before citing more statements from the CFR symposium, let me offer some numbers on these "waves of world illness" we have endured over the last 15 years or so. *Keep in mind that epidemics are the primary justification for internationalisation of a medical monarchy.*

Total cases and deaths:

SARS – 8,096 cases – 774 deaths.

West Nile – 27,836 cases – 1,088 deaths.

Bird Flu – 262 deaths.

Swine Flu – On April 26, 2009, with 20 cases of Swine Flu in the US and no deaths, the US Dept. of Health and Human Services declared a nationwide public health emergency.

The WHO changed its definition of pandemic so that "enormous numbers of deaths and illness" was removed from the definition. This happened in May 2009.

Thus far, WHO estimates about 8,200 deaths from Swine Flu, worldwide. That would average out to about 15,000 deaths for the year. But the CDC claims 36,000 people die every year from *ordinary flu* in the US alone.

So far, the global count of Swine Flu cases is 587,653. Yet WHO states, "Every winter, tens of millions of people get the [ordinary] flu. Most are only ill and out of work for a week, yet the elderly are at a higher risk of death from the illness. We know the worldwide death toll exceeds a few hundred thousand people a year…"

Fear Mongering New Diseases

So why is Swine Flu a pandemic, and why is ordinary flu not a pandemic?

Fear mongering is about NEW diseases. That's why.

It gets worse.

In early November, an explosive report by Sharyl Attkisson hit the CBS News website: Of all the probable or suspected swine flu cases in California actually tested by state labs since July 2009, based on 13,704 tests, only 2% of the patients had Swine Flu. 12% had some other kind of flu. And a whopping 86% didn't have flu at all.

In Florida, based on 8,853 tests for suspected/probable Swine Flu, only 17% had Swine Flu. 83% were negative for other flu. So 83% didn't have ANY kind of flu.

In Alaska, based on 722 tests for suspected/probable Swine Flu, only 11% had Swine Flu. In Georgia, based on 3,117 tests, only 2% had Swine Flu.

My point here is this: All these recent "epidemics" have been outright fakes. The numbers of cases and deaths are miniscule compared with older traditional illnesses – for which no pandemic emergencies have been declared.

Therefore, when the CFR is talking about globalising pandemic responses, and nations surrendering their sovereignty, it's all based on an epidemic cover story that is patently false. It's like saying, "The sky is falling. You have to lend all your support to the construction of a dome that will shield us from the lethal debris. A global 'health czar' will be in charge of building and maintaining the dome, and all governments must bow to his orders, which are given to protect everyone."

Continuing now, with the CFR symposium report: We come to the toxic portion of the issue. In many nations, there has been vigorous debate over the use of so-called adjuvants in flu vaccines. One such substance, squalene, has been banned in several countries, because it can have dangerous effects. But the CFR would apparently like to override this question and promote universal use of squalene in vaccines, despite the glaring fact that Swine Flu itself is so mild the risks of the vaccine far outweigh its need.

"While recently the Obama administration brokered a deal among eleven wealthy nations to donate 10 percent of their vaccine supply of H1N1 to WHO for use in developing countries, Canada has not signed on, in an uncharacteristic decision… On the other hand, the Obama administration has refused the use of adjuvants, which are used in Europe, Canada and Japan to stretch out the antigen supply for wider global use, causing Lange to question the role of the United States as a true 'global player'. Adjuvants help trigger the immune response, allowing dilution of precious flu antigens so that upwards of ten times as many people can be immunised with the same antigen supply. If the US were using adjuvant in its H1N1 vaccines, the country could be in a position to offer sufficient surplus product to WHO to bring the agency's supply for poor countries up by hundreds of millions of doses."

Not "a true global player." That epithet carries considerable weight in CFR and allied circles. It means, "Let's watch this person. If he wants our support, he's going to have to change his tune. Let him understand that."

Combating "anti-vaccine hype"

Finally, the CFR report takes a swipe at people who are educating themselves on the historical toxicity of vaccines. And here, it does:

"The public perception of swine flu has further complicated the issue, causing both public doubt and panic at the same time. Branswell fears that 'the WHO has lost control of the message', allowing misinformed threats, such as the current anti-vaccine hype, to resonate around the world as the scientific community races to catch up with the facts.

"The last great flu pandemic of 1968 occurred in a deeply divided world, where entire regions of the planet were no-travel zones for billions of people. It was an era of telephones and posted mail, evening newscasts, and morning newspapers. Both viruses and information spread comparatively slowly.

"Though today the vaccine methods of production and distribution mirror those practiced a half-century ago, the age of globalisation has ushered in rapid human and animal travel, leading to worldwide spread of viruses. The internet has similarly opened the door to viral spread of disease truths, half-truths and outright lies. Thankfully, the mild H1N1 has offered the world community an opportunity to see these 21st Century challenges without simultaneously experiencing worst-case outcomes. It is a teachable moment, but it remains to be seen whether – on both global and local scales – governments, companies and individuals are learning."

Twenty years ago, when I was writing my first book, *AIDS INC.*, I realised that medical propaganda could be used as a pre-eminent tool in controlling populations, because doctors and public health bureaucrats exude an air of political neutrality.

These esteemed figures appear to have no agenda of a political or economic nature. They speak as minor saints. They always "care and share." When they say citizens must take certain actions to protect themselves and their loved ones, they speak with great authority.

Under that flag, much destruction can be wrought. For example, in certain areas of Africa, people have been dying from the same causes for hundreds of years: protein-calorie malnutrition; outright starvation; gross lack of sanitation; overcrowding; contaminated water supplies; abject poverty; no hope; and more recently, vaccines and medical drugs which, administered to people whose immune systems are already devastatingly compromised, can be lethal.

At the root of these causes is stolen land. Colonisation by governments and then mega-corporations, and brutal repression by local dictators – such controllers want to conceal their own naked actions, and they also want to keep hidden the actual immediate causes of death in Africa – the causes they, the controllers, invoke and maintain.

What better way to reframe this incriminating picture than to claim that a few politically neutral germs are the agents of death. Then, you can build a few showplace hospitals, bring in a bevy of doctors, set up a lab or two and demand that pharmaceutical companies donate medicines for the suffering. Meanwhile, no one cleans up the water, no one restores good land to the dispossessed, and no one alleviates the massively overcrowded living conditions.

Isolate any germ under the sun, give any medicine, as long as the fundamental horrendous facts of life remain the same, people will die in great numbers, and those in control will remain in control.

WHO & CFR: Globalise "humanitarian solutions"

The CFR is part of a sophisticated operation to globalise "humanitarian solutions" under the rubric of medical care. Its main ally is the World Health Organisation, an agency of the UN. Near the close of World War II, members of the CFR were, in fact, tapped to write the basic outline of the soon-to-be created UN.

The WHO is on the march. It is trying to insert itself and its rulings and demands into the governments of many nations. In 2003, it won its biggest one-shot victory. Through fraudulent travel advisories, based on non-science, it raised fears about SARS (at best, a tiny illness) and managed to effectively shut down air travel in and out of Toronto. Toronto lost several billion dollars in the process. I was a peripheral part of a budding effort to convince local business owners to file a lawsuit. At first, there was some enthusiasm, but then it faded out. The people of Toronto knuckled under, some of them lost their shirts, and they plowed on.

The WHO is, by far, the most successful agency of the UN. It has emerged as the rising star of that moribund organisation. It has delivered victories because it is flying under the banner of medical power. The modern priesthood.

CFR, its inner core, is well aware that medical control is a trump card it can play to great advantage. The October Symposium was an event with such an edge.

This is no one-time takeover by force. This is no crashing coup. In intelligence-agency parlance, it's a step-operation. A little progress here, a little progress there. Speakers at the Symposium called Swine Flu "a teaching moment." By this they meant two things. This mild flu gives CFR and its allies a chance to expand their global influence, through the expansion of public-health agencies, most notably WHO and the American CDC. And the population of the planet is "taught" to respect so-called epidemics and the resulting missives that come down from their leaders.

The pace of these fake epidemics and the accompanying media propaganda is quickening. There is an ultimate vision here that at least a few major power players entertain: subsume every citizen of planet Earth under a network of authoritarian medical control – as part of a global-management political system.

Cradle to grave, every person is diagnosed with at least several diseases or mental disorders and falls under the continuing treatment of doctors. These treatments are, for the most part, toxic. That is to say, they weaken the immune system and scramble neurotransmitter systems of the brain. People become less able to take effective action in *any* direction. People everywhere become fixated on their diseases. They become less able to maintain their freedom. They view themselves as lifelong patients.

In case you think this is pure fantasy, let me recite a few facts about the US medical-care system. These numbers are based in part, but not wholly, on a landmark paper published on July 26, 2000, in the *Journal of the American Medical Association*. The paper was titled, “Is US Health Really the Best in the World?” The author was Barbara Starfield, who was then associated with the Johns Hopkins School of Public Health. In other words, this was a mainstream piece of work all the way.

Each year in the US there are:
12,000 deaths from unnecessary surgeries;
7,000 deaths from medication error in hospitals;
20,000 deaths from other errors in hospitals;
80,000 deaths from infections acquired in hospitals;
106,000 deaths from FDA-approved correctly prescribed medicines.
The total of medically-caused deaths in the US every year is 225,000.

This makes the medical system the third leading cause of death in the US, behind heart disease and cancer.

Then if you multiply these numbers by all the people who are emotionally involved in, and temporarily paralysed by, the deaths of these 225,000 Americans, you begin to see the fuller picture of the effects on every level. And all this is just in America.

In, say, Africa, the diversion of attention, by medical propaganda and cover stories, from the *real* causes of millions of annual deaths? How can one even begin to calculate those effects?

If, over the next 10 or 20 years, CFR and its allies, with direct intent or even blind do-good hope, make large strides toward globalising a medical bureaucracy that would oversee the “health of the planet,” consider what that will do, what consequences that will have.

Drop in swine flu cases leads to helpline closure

BBC News, 10 February 2010, 17:44:09 GMT
http://news.bbc.co.uk/go/pr/fr/-/2/hi/health/8509241.stm

The National Pandemic Flu Service in England is to close because of the sharp decline in cases of the H1N1 swine flu virus.

From Thursday anyone who needs medical help because of flu will no longer be able to access anti-viral drugs online or via a helpline.

At its peak, 40,000 people a week received antivirals through the National Pandemic Flu Service.

But the figure has now fallen to below 5,000 a week.

"The virus may not be around at the moment but it could come back" – Sir Liam Donaldson Chief Medical Officer for England

England was the only part of the UK to use this system, and health officials say it could be restored to full operation in seven days should the situation change.

Anyone who thinks they have flu can check their symptoms online.

If they still have concerns they can contact NHS Direct (NHS24 in Scotland) or call their GP.

The Chief Medical Office for England, Sir Liam Donaldson has repeated his call for parents of children aged six months to under five to have them immunised - even though cases of swine flu are very low.

He said: "The virus may not be around at the moment but it could come back.

"Some young children have died and if that happens it will be from a vaccine preventable illness."

The UK ordered 90 million doses of H1N1 vaccine and so far 4.63 million doses have been used in England.

However, Sir Liam denied the government had over-reacted: "We bought it as a precaution because it had to be ordered ahead of time - some of the early news from Mexico was very worrying.

"We acted on a precautionary basis and implemented a well-rehearsed plan."

An announcement is expected in around 10 days regarding what the government will do with its remaining stocks of vaccine.

WHO Emergency Panel to Discuss Whether Flu Has Peaked

Bloomberg, 11 February 2010, 09:16 EST
http://www.bloomberg.com/apps/news?pid=20601081&sid=ak7GG4jGwhHM (deleted)
https://web.archive.org/web/20100220013704/http://www.theflucase.com/index.php?option=com_content&view=article&id=2734%3Awhos-emergency-committee-discussing-if-pandemic-has-peaked-might-not-lower-pandemic-level&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Feb. 11 (Bloomberg) – The World Health Organization will convene a meeting this month of its emergency committee, beginning a process aimed at determining the end of the first influenza pandemic in 41 years.

The committee will discuss whether the H1N1 flu outbreak is past its peak, said Keiji Fukuda, the special adviser to the WHO's director general for pandemic influenza, said on a conference call with reporters today.

While the flu continues to spread in parts of the world, notably northern Africa, eastern Europe and eastern Asia, infection activity is declining, he said. The committee probably will meet in the last week of February, he said.

"What we are hoping for is that the worst is behind us," Fukuda said. "We are seeing an overall declining pattern of activity in the northern hemisphere. However, it's also very clear that the virus has not disappeared and it's continuing to cause disease and death in many parts of the world."

More than 15,000 deaths from the flu have been confirmed by laboratory tests since the outbreak began in April, Fukuda said. The full death toll won't be known for a year or two after the pandemic, he said. Seasonal flu kills as many as 500,000 people a year, according to WHO statistics.

The Geneva-based agency's pandemic guidelines anticipate a "post-peak period" where the worst of a pandemic is over, but normal seasonal flu patterns haven't yet resumed, Fukuda said. The WHO's emergency committee provides guidance and advice to the agency's director general.

Next week, a WHO advisory group will meet to recommend the composition of the seasonal influenza vaccine for the northern hemisphere in the fall. The H1N1 virus may be included in the shot, he said.

"The current pandemic virus is by far the most common virus being isolated for influenza viruses around the world," Fukuda said. "It's showing no signs of disappearing."

WHO's emergency committee discussing if pandemic has peaked might not lower pandemic level

The Flu Case, 13 February 2010
https://web.archive.org/web/20100220013704/http://www.theflucase.com/index.php?option=com_content&view=article&id=2734%3Awhos-emergency-committee-discussing-if-pandemic-has-peaked-might-not-lower-pandemic-level&catid=41%3Ahighlighted-news&Itemid=105&lang=en

WHO spokesperson Gregory Hartl has rejected the notion that a meeting of WHO's emergency committee at the end of the month could result in a lowering of the current pandemic level – currently at level 6 – even though the peak of the pandemic could be declared to be over.

"If the EC recommends and the DG decides that we are in a post-peak phase, this does not mean we move from 6 to 5," he said in an email. "Post-peak means that the peak of transmission is probably behind us but that the pandemic is not yet over."

The pandemic level determines the extent of WHO's powers over governments around the world with a pandemic level 6 giving WHO significant authority over police and health care services.

WHO special flu advisor Dr Keiji Fukuda said he thought it highly likely that a bi annual meeting of vaccine experts on February 18th could result in the swine flu virus being given as part of the regular flu shot programme in the flu season 2010/2011.

Svininfluensan – var det bluff?

Aftonbladet, 14 February 2010
https://web.archive.org/web/20100217032337/http://www.aftonbladet.se/nyheter/article6603505.ab

Svarta rubriker om kaos, skräck och död har förbytts i tystnad. Svininfluensan drog hastigt förbi och lämnade en miljardnota efter sig.

Var insatserna befogade? Eller var hotet tvärt om överdrivet?

Nu väntar eftertankens och utvärderingarnas tid.

– Det har hörts en hel del röster om att detta var en falsk pandemi. Men när besluten fattades tror jag att besluten var adekvata och baserade på den kunskap som fanns vid det tillfället, säger professor Karl Ekdahl, avdelningschef på den europeiska smittskyddsmyndigheten (ECDC).

Vid den här tiden för ett år sedan hade ett influensavirus börjat sprida sig i all tysthet i Mexiko, möjligen också på andra håll i Nordamerika. Det hade lånat genetiskt material från olika influensa-stammar, det var tidigare okänt och det hade utvecklat förmågan att sprida sig från människa till människa.

Stängda skolor

I april upptäcktes viruset i USA, när rutinprover på sjuka barn i Kalifornien gav märkliga resultat i laboratorieanalyserna. USA:s smittskyddsmyndighet CDC slog larm till Världshälsoorganisationen (WHO). Sedan gick det fort. Myndigheterna i Mexiko talade snart om hundratals dödsfall. Skolor, restauranger och teatrar stängdes. Bilder på människor i munskydd spreds över världen under rubriker om attackerande dödsvirus.

Den 11 juni 2009 klassade WHO, med chefen Margaret Chan i spetsen, spridningen av det då världsbekanta viruset som en pandemi. Vid det laget stod det visserligen klart att influensan för de allra flesta smittade gav milda symtom, eller inga alls. Samtidigt var spridningen omfattande och viruset kunde ge svår lunginflammation och systemkollaps hos vissa personer. Barn och unga var i riskzonen för allvarlig sjukdom och död, vilket inte är fallet vid vanlig influensa.

Långa köer

I efterhand har WHO fått massiv kritik för sitt agerande. "En av världens största medicinska skandaler", har exempelvis den tyske Europarådsparlamentarikern Wolfgang Wodarg kallat pandemibeslutet. Han och flera med honom anklagar läkemedelsjättarna för att i eget vinstsyfte, via WHO, ha drivit världens regeringar att agera i onödan.

WHO försvarar sig, och säger sig handla med folkhälsan för ögonen och ingenting annat.

Sverige fick sitt första fall av smitta i början av maj och det första dödsfallet i slutet av augusti. Smittskyddsinstitutet spådde att cirka 50 personer skulle dö om ingen vaccinerades.

I oktober kom de första eftertraktade vaccinleveranserna, men efterfrågan var långt större än tillgången och de första veckorna ringlade köerna långa. Handspriten tog slut. Landets smittskyd-dsansvariga och vårdanställda hade mycket bråda dagar och mediernas bevakning var intensiv.

– Jag har inte precis drabbats av posttraumatisk stress, men det var trötta kvällar, säger Hans-Bertil Hansson, smittskyddsläkare i Region Skåne.

Mycket förvånar

Var pandemin värd allt besvär? Det är alldeles för tidigt att säga, enligt Annika Linde, statsepidemiolog på Smittskyddsinstitutet. Arbetet med att utvärdera hur pandemin hanterades har just påbörjats.

– Vi vet lite grann och vi vet att vi nog har halverat antalet dödsfall i Sverige, säger Linde, och fortsätter:

– Vi har ju lagt ned ett antal miljarder på den här influensapandemin och det är inte min grej att bedöma om det var värt det eller inte, utan min grej är att försöka ta reda på vad vi gjorde, vad vi fick för resultat, hur vi lyckades påverka pandemin och vad det kostade jämfört med vad vi sparade. Sedan måste politiker och medierna och alla övriga debattera om det här är en strategi som vi ska ha i framtiden eller om vi ska ändra på den.

Epidemin kulminerade snabbt. Efter bara ett par veckor på toppen vek den undan och det märkliga är att det skedde ungefär samtidigt i Sverige och i länder som inte alls hade vaccinerat lika flitigt.

– Jag begriper det inte. Det är mycket som har förvånat oss med den här pandemin, säger Hans-Bertil Hansson.

Vaccin över

I dag är efterfrågan på vaccin låg i Sverige. Cirka sex miljoner doser har gått åt av totalt tio miljoner levererade.

Pandemin är ännu inte avblåst. Kanske kommer den, likt tidigare pandemier, tillbaka i en andra våg. Kanske stannar viruset kvar som vanlig säsongsinfluensa.

Nu vidtar arbetet med utvärdering i Sverige, Norden, Europa och världen.

– Det är fortfarande en sjukdom som vi tittar väldigt intensivt på, säger Karl Ekdahl på ECDC.

THE FLU CASE

Swine flu just a hoax?

Aftonbladet // The Flu Case, 15 February
https://web.archive.org/web/20100220013740/http://www.theflucase.com/index.php?option=com_content&view=article&id=2743%3Aswine-flu-just-a-hoax-swedish-media-pretend-to-care&catid=1%3Alatest-news&Itemid=64&lang=en

This headline is today flashing by on the Swedish Aftonbladet news paper site.

The article then goes to describe the dark horror filled headlines which pushed about 30 million Europeans to take the poisonous so called swine flu shot. The article goes on to give a very twisted description of the events that took place last year with the usual complete disregard for facts. Most astonishingly, the paper does not mention its own vital part in the propaganda, a massive concerted campaign not seen in Swedish media for a very long time if ever before.

"The epidemic culminated fast. After just a few weeks at the top, it declined and the strange thing is that it did so at about the same time in Sweden and in countries which did not vaccinate so fiercely."

"- I don't Get it. There are many things that has taken us by surprise with this pandemic" says Hans Bertil Hansson, specialist in infectious diseases.

The article goes on to state that six million doses of vaccine "was used" in Sweden out of ten million delivered but that statement is an obvious attempt to make the reader believe six million Swedes took the vaccine. The truth is that there is no accurate statistics available and the only thing kept track of is doses distributed, not injected. It was clear from the start that part of the propaganda campaign was set up so that it would seem very many decided to take the shot. Anyone reading carefully could clearly see that the wording used was deliberately misleading the public about this and very many other things. The truth is that the real number of Swedes taking the vaccine are dramatically lower than what is officially stated. No real data about damages, deaths or other "side effects" from the poisinous Pandemrix shots are made available other than the ususal polished and washed data which by now, no one believes in anyway.

Reading the article makes it clear that media now will be forced to pretend to "investigate" the flu hoax and that they for sure will not do their job, which in fact they should have done over a year ago. They will pretend to "investigate", not because they want to know the truth and share it with the public but because they are forced to since it is now clearly one of the biggest medical scandals in the history of mankind.

If anything, the population have lost a great deal of trust in both Swedish media, journalism, politicians and the Swedish medical system, since it is clear to everyone that the health of the people is not the priority and that "someting else, something strange and fishy" is going on. Government agencies who should protect the citizens of the country have clearly failed and even worse, have knowingly tricked, fooled and lied to the people. They have shown that they truly serve other interests and that they willingly do play an active role in the depopulation program.

Side effects showing later than three weeks after the shot will not be recorded. The whitewash has started.

Well over 100 people in Sweden have died from the poisinous "swine flu" Pandemrix shot (the real number might never become known), dozens of abortions have been privately reported (how many really occured might never be known) and the real damage of this poisinous vaccine will be obvious the coming years in the form of suffering, disease and death among tens of thousands of victims. Pandemrix, this deadly cocktail, is what is called a "slow killer" and the ones responsible for pushing it onto the population, knowing the facts and dangers - the media, politicians, doctors and authorities - are nothing but murderers.

Puzzled doctors asking: Where is the flu?

SFGate, 16 February 2010
https://www.sfgate.com/health/article/puzzled-doctors-asking-where-is-the-flu-3199104.php

The swine flu has all but disappeared for the time being, but in its wake public health officials are facing a bizarre influenza season - there's almost no seasonal flu going around.

This time of year is typically the peak of flu season, but doctors and health care clinics are reporting flu cases far below normal levels. The early spread of the swine flu last fall seems to have either delayed, or perhaps prevented entirely, the normal flu season.

"I have never seen a year when it's been this late in the season and there hasn't been any influenza activity yet," said Dr. Randy Bergen, clinical lead for the flu vaccine program for Northern California Kaiser. "It certainly isn't out of the question that seasonal flu could still show up, but for there to be no activity right now is pretty extraordinary."

Few doctor visits for flu

In California, about 4 percent of visits to doctors' offices this time of year typically are for flulike illnesses, according to the state Health Department. But as of last week, less than 2 percent of visits were for flulike illnesses. And of those patients who were tested to determine what illness they had, almost none had any type of influenza - seasonal or swine flu.

People are still getting sick, and at least anecdotally, doctors say they're just as busy right now as any other February. But their patients aren't catching the flu.

"Our doctors are seeing a lot of sick patients from other causes," said Dr. Bela Matyas, an acting chief in communicable disease control in the California Department of Public Health. "It's probably the same stuff that's out there every year, but we never notice it because we have influenza as well."

Public health officials have been tracking four versions of flu this year: one strain of influenza Type B, and three strains of influenza Type A. The swine flu is a strain of influenza Type A, subtype H1N1. The other three influenza viruses are considered seasonal strains, in that they regularly show up during a certain time of year.

In the absence of influenza, one of the most common viruses going around at the moment is the respiratory syncytial virus, or RSV. Public health officials say the virus that causes the common cold is also fairly widespread, but it's not generally tested for so there's no way to know how many people are sick.

RSV mostly affects small children and causes symptoms similar to the flu. It usually arrives before the flu season, so by this time of year it's started to recede.

"We were hit very hard by RSV in January," said Dr. Larry Drew, head of the UCSF virology lab, which tests virus samples in San Francisco. "People who are sick now probably think swine flu is still going around, but they really have RSV or something else."

Public health officials say they don't know why the swine flu seems to have squeezed out seasonal flu, at least for now. It's possible that people who got sick with swine flu ended up with some small protection from seasonal flu. Or perhaps the massive, rapid spread of swine flu in the fall prevented seasonal flu from ever taking hold.

Public health officials also point out that seasonal flu may still make an appearance. It's unusual, but not unheard of, for seasonal flu to peak as late as March.

Flu could hit yet

"Apparently in China right now, two-thirds of the flu circulating is Type B. So we're watching closely to see what happens with flu B here," said Dr. Erica Pan, an infectious disease specialist with the San Francisco Public Health Department.

Meanwhile, public health officials still encourage people to get the swine flu vaccine. The hope is that with millions vaccinated, and millions already having been sick with swine flu last spring or fall, the population as a whole will be protected from a third wave of illness.

As many as 84 million Americans have been infected with swine flu since it was first identified last April, according to new data from the U.S. Centers for Disease Control and Prevention released Friday. As many as 17,160 people have died, 10 percent of them children under age 18.

Bloomberg BusinessWeek

Deadly Hybrid Flu Possible
Stronger strain could develop if avian, seasonal viruses combine, scientists warnBusinessweek

Business Week, 22 February 2010
https://web.archive.org/web/20100329194832/http://www.businessweek.com/lifestyle/content/healthday/636221.html

MONDAY, Feb. 22 (HealthDay News) – Research in mice suggests the avian flu virus and the ordinary seasonal flu virus could combine to create a new deadly kind of flu, researchers say.

A single bit of genetic material from the seasonal virus converted the avian flu – officially known as H5N1 – into a very dangerous form, the scientists report in a study published in the Feb. 22-26 online edition of the *Proceedings of the National Academy of Sciences*.

"Some hybrids between H5N1 virus and seasonal influenza viruses were more pathogenic than the original H5N1 viruses. That is worrisome," study senior author Yoshihiro Kawaoka, a virologist at the University of Wisconsin-Madison, said in a news release.

Avian flu, also known as bird flu, has killed 262 people, according to the World Health Organization, but it hasn't become very infectious between people.

The researchers warn that swine flu – H1N1 – could also play a role in viral combinations.

"With the new pandemic H1N1 virus, people sort of forgot about H5N1 avian influenza. But the reality is that H5N1 avian virus is still out there," Kawaoka said. "Our data suggests that it is possible there may be reassortment between H5N1 and pandemic H1N1 that can create a more pathogenic H5N1 virus."

Swine Flu may have infected 63 Million Americans, study Finds

Bloomberg, 22 February 2010, 2:41 AM EST
https://web.archive.org/web/20100227034841/http://www.businessweek.com/news/2010-02-22/swine-flu-may-have-infected-63-million-americans-study-finds.html

Feb. 22 (Bloomberg) – Swine flu may have infected at least 63 million people in the U.S. last year, according to a study in Pittsburgh, where almost every second schoolchild probably caught the pandemic virus.

Blood tests on Pittsburgh residents found 45 percent of people aged 10 to 19 years had antibodies against the new H1N1 flu strain. About 22 percent of people across all groups developed immunity to the virus by early December and quarter of those born in the 1920s may have already had protective antibodies before the pandemic resulting from prior flu infection, researchers at the University of Pittsburgh found.

The findings, reported online yesterday in the Public Library of Science, suggest a fresh wave of swine flu infections isn't likely unless the virus mutates or people become more susceptible to infection. A World Health Organization advisory panel is holding a teleconference tomorrow to discuss whether the first influenza pandemic in 41 years has peaked.

"With current estimates of seroprevalence and continued increases in population due to vaccination, a significant change in viral antigens or a change in population immunity would be required for further disease spread," Ted Ross, associate professor of microbiology at the university, and colleagues wrote. "We cannot rule out the possibility that geographical pockets of limited immunity may be present in which a third wave may yet occur."

Symptom-Free Cases

At least 15,921 people have died from swine flu as the fast-moving pandemic spread to 212 countries and territories since its discovery in North America in April, the WHO said in a Feb. 19 statement. The global tally underestimates the actual number as many deaths are never tested or recognized as influenza related, the Geneva-based agency said.

In yesterday's study, researchers looked for infection- fighting antibodies against the 2009 pandemic flu strain in 846 anonymous blood samples collected in November and early December from people in southwestern Pennsylvania's Allegheny County ages 1 month to 90 years. The tests identified people who caught the virus, including those who didn't develop a fever, cough or other flu-like symptoms.

The researchers compared the results against tests on blood samples collected in 2008, of which 6 percent contained antibodies that protected against swine flu, probably as a result of infection from a related influenza strain.

Children and adolescents in the 10- to 19-year age group had the highest prevalence of swine flu antibodies, while 29 percent of blood samples from children younger than 9 years tested positive. Residents in the 70- to 79-year age group had the lowest prevalence rate of 5 percent.

When the researchers extrapolated their findings across the county's 1.2 million residents, they found swine flu antibodies in 21.5 percent of people, including more than 70,000 school-age children.

"Extrapolating these results further to the entire US population, we estimate that 63 million persons became infected in 2009," the authors wrote.

THE FLU CASE

French commission of inquiry into mass swine flu vaccination campaign to start in March

The Flu Case, 23 February 2010
https://web.archive.org/web/20100301040144/http://www.theflucase.com/index.php?option=com_content&view=article&id=2807%3Afrench-commission-of-inquiry-into-mass-swine-flu-vaccination-campaign-to-start-in-march&catid=41%3Ahighlighted-news&Itemid=105&lang=en

An inquiry into the influence of pharmaceutical companies on the French government's handling of the mass swine flu vaccination campaign is set to be held in March in the Senate, the Upper Chamber of the French Parliament, following a decision by the Senate Conference of Presidents on Wednesday 17th, February.

A second commission of inquiry is expected to be announced soon in the National Assembly.

Le Parisien reported that 15 of the 17 experts in the French government's swine flu committee had links with the pharmaceutical industry with six of the experts having receiving money directly from pharma companies in 2009.

The French government ordered 94 million doses of swine flu jabs but only 5.5 million doses were administered in spite of an unprecedented campaign.

Only 269 deaths have been attributed to the swine flu in France as of the middle of January.

A report in French:

H1N1 Au Senat: Les questions posées à Roselyne Bachelot

Source: Journal Officiel, «Compte

Politique et santé

Quelle que soit la forme de l'enquête à laquelle la Ministre de la Santé devra répondre sur la gestion nationale de la grippe A/H1N1, en attendant, les questions en francs-tireurs des parlementaires ne manquent pas. Exemple, lors d'une séance de questions aux ministres au Sénat, le sénateur Nicolas About a posé la question qui pourrait fâcher…

«Après l'affaire du sang contaminé, la canicule et l'inscription - peut-être à tort - du principe de précaution dans notre Constitution, quelle peut bien être la marge d'action des pouvoirs publics en matière de risque sanitaire?». Pourquoi, M. About ? Parce que «soit ils n'agissent pas et sont comptables de toute réalisation du risque, soit ils prennent la menace au sérieux et s'exposent à l'écueil inverse: se voir reproché d'avoir surréagi».

Nos pouvoirs publics ont-ils «surréagi» face à l'annonce d'une pandémie dont le vecteur pouvait être si variant (le vaccin 2008-2009 contenait 2 souches A: H1N1 et H3N2 et 1 souche B) qu'il nécessiterait peut-être 2 injections au lieu d'une en saison normale de grippe, le «très important dispositif mis en place contre la pandémie» -qui n'avait chez nous qu'un caractère épidémique) se justifiait-il alors que cette grippe a touché (seulement) 3 millions de personnes et causé 269 décès (seulement ?) en France à mi-janvier ?

Conclusion du sénateur About: «Or le virus s'est révélé beaucoup moins virulent qu'on aurait pu le craindre et la campagne de vaccination n'a pas rencontre le succès escompté: les décisions prises se sont donc trouvées invalidées par les faits». Le sénateur conclut: «Nous ne vous blâmons pas d'avoir pris ces décisions».

Quelles leçons tirer de tout cela ? Les parlementaires veulent la transparence des décisions, sur le rôle de l'OMS et des comités d'experts incitant à commander 94 millions de doses, «dont 88 millions sont toujours inutilisées», dont toutes n'ont pas été livrées et à sur-stocker antiviraux et masques. Bref: combien cela coûte, quels sont les accords avec les laboratoires, quelles leçons tirer de tout cela ?

Comme d'autres pays (à qui il reste aussi des stocks inutilisés), la France a décidé de mener une vaste campagne de vaccination car «cette grippe avait une typologie différente de celle des autres grippes», donc l'offre du nouveau vaccin devait être large. Mais ce choix de stratégie «s'explique par une raison technique mais aussi par une raison éthique», dit Madame Bachelot.

Sur le plan éthique « nous nous sommes référés à l'avis n° 106 du Comité consultatif national d'éthique, selon lequel, au nom du principe de l'égalité républicaine, dans le cadre d'une pandémie grippale, tous nos concitoyens qui le souhaitent doivent pouvoir être vaccinés ».

Sur le plan technique « les autorités sanitaires nationales et internationales nous ont indiqué qu'il s'agissait d'une vaccination à deux doses mais que, à l'évidence, certaines personnes n'allaient recevoir qu'une seule dose : en tenant compte d'un taux d'attrition de 25 %, nous avons donc acheté 94 millions de doses ».

Ce n'est en fait que fin novembre que les autorités sanitaires européennes et internationales ont fait savoir qu'une seule dose vaccinale suffisait à établir l'immunité spécifique, ce qui a conduit la France à résilier une commande de 50 millions de doses.

Bilan à mi-janvier: 5,5 millions de doses utilisées, 10 millions de doses offertes à l'OMS sur 44 millions de doses. Il reste environ 25 millions de doses utilisables, et que l'on va utiliser, car la vaccination contre le virus A/H1N1 est toujours d'actualité, au moins jusqu'au septembre - jusqu'à l'apparition de la grippe de la saison.

«Le risque pandémique est toujours là et nos compatriotes doivent se faire vacciner car c'est la meilleure technique de prévention», conclut la Ministre de la Santé. La vaccination anti-pandémique est désormais confiée aux médecins traitants. Car comme dit le Dr Keiji Fukuda, conseiller spécial de l'OMS pour la grippe pandémique, «Nous espérons, c'est que le pire est derrière nous», ce que devrait déterminer un Comité d'urgence de l'OMS à la fin de ce mois, pour déterminer une éventuelle nouvelle stratégie de l'OMS si une seconde vague s'annonce ou si la situation redevient analogue à celle d'une grippe saisonnière.

THE FLU CASE

NHS cuts feared after flu spending

The Flu Case, 23 February 2010, 16:11
https://web.archive.org/web/20100301040124/http://www.theflucase.com/index.php?option=com_content&view=article&id=2803%3Anhs-cuts-feared-after-flu-spending&catid=41%3Ahighlighted-news&Itemid=105&lang=en

(UKPA) Health Secretary Andy Burnham mounted a strong defence of Government spending on swine flu as the Tories warned NHS capital projects could be cut to pay for unused vaccines.

It came as a Commons written statement showed that the Department of Health had transferred £200 million from its capital budget to its revenue budget to "meet existing commitments on pandemic flu".

During Commons question time, Mr Burnham said 38 million swine flu vaccines had so far been provided to the UK by drug firms GlaxoSmithKline (GSK) and Baxter Healthcare.

Shadow health secretary Andrew Lansley said: "You said you have 38 million doses, we've used five million. How much is going to be the total cost of the procurement of these vaccines and what are going to be the cuts in capital projects now in the NHS to pay for that?"

Mr Burnham admitted that the Government had "secured a surplus" but there would still be a need for vaccines in the future.

He said: "While we have secured a surplus, this strain H1N1 is likely to replace the seasonal flu as the main strain this year. We will continue to have a need for this vaccine going forward.

"You will know that the Chief Medical Officer's (Sir Liam Donaldson) advice to the at-risk group is that they continue to accept vaccination because while the second wave has ended, there could be a third wave later in the year."

He said it was not yet possible to give a final figure on spending as contractual negotiations with GSK were ongoing.

Some 309 people have died after contracting the disease in England and there were still people with the condition in hospital, he added.

The Washington Post

David Brown

Swine flu wanes, but experts say pandemic strain could reemerge

Washington Post, 23 February 2010
https://www.washingtonpost.com/wp-dyn/content/article/2010/02/22/AR2010022203638.html?hpid%3Dsec-health&sub=AR

Even as officials from the Centers for Disease Control and Prevention are announcing that the epidemic of the H1N1 flu is no longer widespread in any state, no disease expert is willing to say there isn't a third – or fourth – wave of swine flu in the country's future.

Influenza transmission waxes and wanes, and outbreaks of novel pandemic strains occur in particularly unpredictable waves that depend on such variables as human behavior, atmospheric conditions and even competition from other microbes. That places them among the bigger mysteries of epidemiology, the science of disease outbreaks.

The "Spanish flu" of 1918 had four waves of greatly differing deadliness, spread over two years. The "Asian flu" of 1957, like the current H1N1 strain, had a late-spring and a fall wave – followed by a third in late winter of 1958. It then took a year off before peaking again in 1960. The "Hong Kong flu" of 1968 had more than a year hiatus between its two waves, with the second infecting nearly as many people as the first.

"We are not at all out of the woods because the virus continues to circulate, but the chances of a very large additional wave are very hard to predict," said Anne M. Schuchat, who is leading the government's response to the H1N1 pandemic at the CDC.

What explains the retreat of this flu since its peak in late October? "That's a great question, and it is still very much an open question," said Katia Koelle, a biologist at Duke University who studies the dynamics of disease outbreaks.

Why doesn't a flu outbreak last all winter, when the optimal conditions of cool temperatures, low humidity and crowded living are present? "It just doesn't. It runs through a community and moves on," said Walter R. Dowdle, who worked at CDC during the 1968 pandemic and is now an epidemiologist at the Task Force for Global Health in Decatur, Ga.

"Why do we have waves? I can't find anybody who can tell me a biological explanation that makes sense," said Michael T. Osterholm, director of the Center for Infectious Disease Research and Policy at the University of Minnesota.

At one level, the reason for H1N1's waning is straightforward. People infected with the virus are passing it on to fewer people now than they were last fall.

The growth and maintenance of a disease outbreak is a matter of simple arithmetic. If each person carrying a microbe passes it on to more than one person, the epidemic will spread. If each person passes it, on average, to less than one person – which means that many people don't transmit it to anyone – then the epidemic will eventually burn out.

Let's do the numbers

How many people the average infected person infects is called the basic reproductive number, or R0 (pronounced "R naught"). It is a crucial feature of each microbe's personality. Some microbes are simply more transmissible than others; they have a higher R0.

Measles, which is probably mankind's most contagious infection, has an R0 of about 18. Polio's number is about 6; severe acute respiratory syndrome (SARS) about 5. For seasonal flu strains, the R0 is about 1.2, and for pandemic strains it is rarely higher than 2. For the novel H1N1 strain (also known as swine flu), it's about 1.6.

What this low R0 means is that flu outbreaks are always teetering on the verge of having their myriad chains of transmission broken by people who get infected but don't pass the virus to anyone else.

Flu viruses typically spread quickly among children, who gather in school and then pass the virus on to the rest of the population. The brief first wave last spring was most evident in schools, particularly in New York. The virus spread during the summer in places where children congregated, specifically camps. The second wave took off with the nationwide resumption of the school year in September.

"The main determinant of decline is vacation period, and the main determinant for the rise again is the aggregation of people for school terms," said Roy Anderson, a professor of infectious disease epidemiology at University College London.

One consequence of this is that when a lot of children get infected, recover and become immune, the entire epidemic slows down. "With this virus, once about half the children are infected . . . then you really can't sustain transmission unless the infectivity goes up for some reason," said Ira Longini, a disease modeler at the University of Washington.

That's apparently what happened last fall and in the Asian flu of 1957, its eerily similar predecessor.

Visits to doctors' offices for flu peaked in this pandemic in the week ending Oct. 24. In 1957, school absenteeism peaked in the last two weeks in October, depending on the city. (In both epidemics, the peaks occurred before there was any appreciable use of vaccine.)

What's next?

So why did the virus start to ebb so early, and does that say anything about the likelihood of a third wave?

In 1957, the epidemic may have simply have run out of children. A study of one of the first places hit by the 1957 virus – Tangipahoa Parish, in Louisiana – found that 60 percent of schoolchildren were infected in that fall wave. What fraction of schoolchildren are now immune to the H1N1 virus – either because they've had it, or have gotten the swine flu vaccine -- isn't known. But CDC is trying to find out.

The Asian flu virus came back in February 1958, ultimately killing about 20,000 people (compared with 40,000 in the fall). Most of the deaths occurred among old people, who were spared in the fall for mysterious reasons -- possibly because they had little contact with schoolchildren. Epidemiologists believe today's elderly may be partly immune to the H1N1 virus because of exposure to a related virus that circulated more than 40 years ago. If so, an Asian-flu-like third wave is less likely.

What does seem clear is that environmental conditions for a flu outbreak are better now than they were last October.

A study published in December in the journal Public Library of Science Currents provided real-world support for numerous lab experiments showing that flu virus survives best in dry air.

A team of virologists and climate researchers, led by Jeffrey Shaman of Oregon State University, showed that over a period of 31 years seasonal flu outbreaks in the United States consistently started about three weeks after a marked decline in the humidity of the air. They used this observation to predict the timing of outbreaks in five states with different climates (Arizona, Florida, Illinois, New York and Washington), and the predictions were accurate.

The message is clear: When the air is dry, the virus spreads. Typically, winter air – both outdoors and in – is the driest of all seasons. The air is drier now than it was last fall, so the H1N1 virus should be spreading better now than it did in October. But it isn't.

Of course, there may be *other* reasons for that, including the need for influenza virus to compete with other microbes for human noses and throats.

When a person is infected with one respiratory virus (such as rhinovirus, which causes colds), the chance of catching a different virus (such as flu) declines greatly. Part of the reason is that the first infection provokes what's called "innate immunity" – a flood of interferon and other cellular hormones that defend the body in a general way without specifically targeting the invader. That protection can last weeks, breaking chains of transmission and slowing a flu epidemic.

A similar form of interference occurs *between* strains of flu, which is one of the reasons there's been almost no "seasonal flu" in recent months. The strains circulating last season and still occasionally found this season – H3N2, other forms of H1N1 and influenza B – have all been outcompeted by the upstart H1N1.

In fact, even if there isn't a third wave, the new H1N1 may well spell the end of one or more of the families of flu virus that have been circulating for decades. That's what's happened in previous pandemics, at least.

The H1N1 family arrived in 1918 with the Spanish flu. In the 1957 pandemic, the new virus was in the HN2 family; it drove all H1N1 strains to extinction. In 1968, the new virus was an H3N2. It spelled the end of the H2N2 family, which disappeared. H1N1 returned in 1977, apparently the result of an accidental release from a laboratory in Russia or China.

Like all pandemic strains, the novel H1N1 virus (or an immediate descendant of it) will eventually infect – but not necessarily sicken – nearly everybody on Earth who isn't already immune to it through vaccination. It may take years. It could happen by unpredictable waves or slow percolation. But it is virtually inevitable.

"We're going to have this virus for many decades to come," said Longini, the University of Washington epidemic modeler. "And we don't know what it's going to do next."

THE FLU CASE

WHO Set to Announce Swine Flu has Peaked, Warns of Bird Flu

The Flu Case, 23 February 2010, 16:13
https://web.archive.org/web/20100301040131/http://www.theflucase.com/index.php?option=com_content&view=article&id=2804%3Awho-set-to-announce-swine-flu-has-peaked-warns-of-bird-flu-&catid=1%3Alatest-news&Itemid=64&lang=en

(Feb. 23) – The World Health Organization is expected to announce that the worst of the swine flu pandemic is over.

But the WHO won't be proclaiming the end of the H1N1 pandemic entirely. Instead, a panel of experts meeting today will determine whether the global community has moved into "a post-peak period," where rates of illness start returning to more typical influenza levels.

And the panel warns that this final stage could endure for months. The WHO is scheduled to announce the panel's decision Wednesday.

"There is no on and off switch for a pandemic, and it's not a single event," WHO spokesman Gregory Harti said at a news conference. "What we have to see is that the behavior of the H1N1 virus becomes like the behavior of other seasonal viruses."

As of now, the virus is still causing outbreaks in atypical flu seasons and affecting groups not usually at increased risk of seasonal influenza, like kids and teens. Seasonal influenza is usually predominantly seen in the elderly.

The WHO first announced that swine flu had reached pandemic status in June, when it raised the alert level on the illness to the maximum level of six on its warning scale.

Right now, the estimated global death toll is 16,000, with millions having been infected since the initial outbreak. In the United States, a study out of Pittsburgh extrapolated blood samples from 846 residents to estimate that 63 million Americans fell ill with the flu strain. More than 70 million have been vaccinated.

Even if the WHO panel determines that the virus has peaked, warnings will likely persist. Transmission rates can come in waves, and many experts are wary that we could experience more peaks and crests before the strain is finally contained.

"We are not at all out of the woods because the virus continues to circulate, but the chances of a very large additional wave are very hard to predict," Anne M. Schuchat of the Centers for Disease Control and Prevention told The Washington Post.

The latest update from the CDC is, however, a promising one: Its data shows that swine flu activity is "relatively low" and isn't spreading out of control anywhere in the country.
=> https://web.archive.org/web/20100302074546/http://www.cdc.gov/h1n1flu/

But as H1N1 begins to wane in the public consciousness, new warnings of a hybrid combination between avian flu (H5N1) and regular human influenza are beginning to circulate. A study in this week's Proceedings of the National Academy of Sciences determined that the combination has the potential to create "highly pathogenic viruses" easily transmitted between humans.

Dr Margaret Chan

Director-General Statement
Following the Seventh meeting of the Emergency Committee

Geneva, WHO, 24 February 2010
https://www.who.int/news/item/24-02-2010-director-general-statement-following-the-seventh-meeting-of-the-emergency-committee

The Emergency Committee held its seventh meeting by teleconference on 23 February 2010. The Director-General sought the Committee's views on the determination of the pandemic status.

A detailed update was provided to the Committee on the global pandemic situation. After asking additional questions and reviewing the evidence and holding extensive discussion, the Committee was of the view that there was mixed evidence showing declining or low pandemic activity in many countries, but new community level transmission activity in West Africa. Moreover, they expressed concern that the winter months of the Southern Hemisphere had not yet started and there was uncertainty whether additional generalized waves of activity might occur and the need to not undermine preparations. The Committee advised that it was premature to conclude that all parts of the world have experienced peak transmission of the H1N1 pandemic influenza and that additional time and information was needed to provide expert advice on the status of the pandemic. The Committee accordingly suggested that the Committee be re-convened in a few weeks to review intervening developments and related epidemiological information.

Having considered these views, the current epidemiological evidence and other relevant information, the Director-General determined that there had been no change in the pandemic phase, and decided to continue to monitor the situation and developments closely and to convene the Committee again within the next several weeks.

The WHO Director-General asked the Committee for their views on continuance of the three current temporary IHR recommendations issued for the public health emergency of international concern. The consensus view of the Committee was in favor of continuation but to update the second recommendation by replacing "Intensify" with "Maintain" in recognition of the increased pandemic surveillance already implemented by countries and the need to maintain this activity. Having considered the views of the Emergency Committee, and the ongoing pandemic situation, the Director-General determined to continue the three temporary recommendations, as modified, namely:

- countries should not close borders or restrict international traffic and trade;
- maintain surveillance of unusual flu-like illness & severe pneumonia;
- if ill, it is prudent to delay travel.

Pandemic has not yet peaked, WHO experts advise

Reuters, 24 February 2010, 9:33 AM GMT+8
https://www.reuters.com/article/business/healthcare-pharmaceuticals/pandemic-has-not-yet-peaked-who-experts-advise-idUSTRE61M6DM/

Washington (Reuters) - The pandemic of H1N1 swine flu has not yet peaked, a committee of experts advised the World Health Organization on Tuesday.

"The committee advised that it was premature to conclude that all parts of the world have experienced peak transmission of the H1N1 pandemic influenza and that additional time and information was needed to provide expert advice on the status of the pandemic," WHO spokesman Gregory Hartl said by e-mail.

WHO planned a news conference for Wednesday.

The United Nations agency declared last June that the new virus was causing the first influenza pandemic in more than 40 years after it spread around the world from Mexico and the United States in just six weeks.

Under WHO rules the emergency committee, composed of 15 experts and headed by Australian John MacKenzie, makes confidential recommendations to WHO director-general Dr. Margaret Chan.

She is then required to inform the health ministries of WHO's 192 member states and the Vatican of her decision. The WHO's decision will be announced formally by the WHO's top flu expert Dr. Keiji Fukuda on Wednesday at 1000 GMT.

WHO has confirmed the virus has killed 16,000 people but notes this is a gross underestimate, as hardly any patients are diagnosed or tested. It will take a year or two after the pandemic ends to establish the true death toll, the WHO says.

The Centers for Disease Control and Prevention does projections based on testing and patterns of disease reports and projects that H1N1 has killed up to 17,000 people in the United States alone, and put as many as 370,000 into the hospital with serious illness.

In contrast, seasonal influenza kills 250,000 to 500,000 people globally but most are frail and elderly. H1N1 has attacked young adults and children.

Substantial Outbreaks

The pandemic sparked a race to develop new vaccines by drug makers including GlaxoSmith Kline and Sanofi-Aventis but has proved to be of moderate severity, and many people failed to take the new vaccine.

Previous influenza pandemics have had waves of disease activity spread over months, meaning the post-peak period could last quite a while, according to the WHO.

The final stage, called the post-pandemic period, is when disease activity returns to levels normally seen for seasonal influenza, it says.

"There is no on and off switch for a pandemic. It's not a single event. What we have to see is that the behavior of the H1N1 virus becomes like the behavior of other seasonal viruses," Hartl said earlier on Tuesday.

"At the moment, it is still causing substantial outbreaks of disease outside the normal influenza seasons and affecting groups who are not normally affected by seasonal influenza. So as long as that continues, it does not behave like seasonal influenza."

Younger people, especially those with chronic medical conditions, and pregnant women continue to be at a higher risk of infection and viral pneumonia from the H1N1 virus, Fukuda told reporters last week.

The WHO has cautioned that the H1N1 virus could still mutate or mix with the more deadly bird flu virus, which remains endemic in poultry in many Asian countries.

WHO to assess whether H1N1 has peaked within weeks

Reuters, 24 February 2010, 7:49 PM GMT+8
https://www.reuters.com/article/economy/who-to-assess-whether-h1n1-has-peaked-within-weeks-idUSLDE61N1CU/

GENEVA, Feb 24 (Reuters) – Health experts will review the status of the H1N1 pandemic in a few weeks to decide whether it has peaked but it is already clear that it is less severe than previous outbreaks, the World Health Organisation said.

The WHO's emergency committee decided on Tuesday that it was premature to declare the pandemic, which was declared in June and was the first in more than 40 years, was past its worst.

The 15 members of the body that makes confidential recommendations to WHO Director-General Dr. Margaret Chan deliberated for two hours but decided there were too many uncertainties about how the pandemic was behaving, even if it appeared to be subsiding in North America and Europe.

Dr. Keiji Fukuda, the WHO's top influenza expert, told reporters on Wednesday that rising levels of infection in West Africa and the risk posed by the winter months in the southern hemisphere were the dominating concerns of the committee. "We have some reason to be concerned about what may develop as half of the world goes into its winter months," Fukuda said.

He said the United Nations health agency had confirmed reports of rising infection in Senegal and Mauritania, and was checking to see whether the flu virus was spreading in other parts of West Africa.

Fukuda urged people and governments not to let their guard down even though the current swine flu outbreak has not been as harsh as pandemics that killed millions over the past century. "This pandemic appears to be on the less severe side of the spectrum of pandemics that we have seen in the 20th century," he said.

Over 16,000 Confirmed Deaths

So far the WHO has confirmed 16,226 deaths attributable to the H1N1 pandemic virus, but the real death toll – which will take a year or two to ascertain – will be much higher, as many victims have so far not been diagnosed with the flu strain.

People should continue to seek vaccination against the pandemic, which is dangerous for young adults, especially those with chronic health conditions, and pregnant women, in contrast to seasonal strains where the elderly are vulnerable, he said.

Fukuda said over 300 million people have now been vaccinated against pandemic influenza, and the shots, which have an excellent safety record, have proved 70-75 percent effective.

The pandemic sparked a race to develop new vaccines by drug makers such as GlaxoSmithKline <GSK.L> and Sanofi-Aventis <SASY.PA> but many people have not taken the vaccine as the outbreak has turned out to be fairly mild.

A decision by the WHO emergency committee that the pandemic has entered a "post-peak" phase will indicate to governments and health authorities that the virus, while still a global pandemic, is in a transition to a more normal state of affairs where it circulates as seasonal influenza.

That would enable authorities to revise their emergency health arrangements. (For WHO statement go to http://link.reuters.com/zeh62j) (Additional reporting by Kate Kelland in London; Editing by Noah Barkin)

THE FLU CASE

WHO keeps world on pandemic emergency level 6

The Flu Case, 24 February 2010, 11:34
https://web.archive.org/web/20100301040204/http://www.theflucase.com/index.php?option=com_content&view=article&id=2811%3Awho-keeps-world-on-pandemic-emergency-level-6&catid=41%3Ahighlighted-news&Itemid=105&lang=en

WHO special pandemic flu advisor Dr Keiji Fukuda today said that there were no plans to lower the pandemic threat level from the current level 6.

Six is highest pandemic emergency level that allows for emergency drug use authorization and also for WHO to assume control of health and police services of 193 countries under the pretext of managing a pandemic threat.

WHO said it had followed the recommendation of an emergency committee headed by Dr John Mackenzie that met yesterday, Tuesday, on the request of General-Director Dr Margaret Chan.

Mackenzie, an Austrialian biosecurity scientist, also headed the emergency committee that declared a pandemic level emergency level 6 in June over the mild swine flu.

He has recently come under scrutiny for his financial links to pharmaceutical companies. The names of the other members of the WHO emergency committee are not known, making it impossible to ascertain what links they may have to pharmaceutical companies.

These have made huge profits from vaccine sales due to WHO's pandemic declaration.

The decision not to declare the pandemic is "post peak" will come as a surprise given that the latest update from European Centre for Disease Prevention and Control (ECDC) reports that pandemic flu activity has passed its peak in most of Europe.

Only 6.7% of the 684 specimens testing positive for the influence virus, and most of those in eastern European countries such as Romania.

According to the ECDC update, only 1549 people in Europe have died from the swine flu virus, a fraction of the number of people who die each year from the seasonal flu.
=>http://ecdc.europa.eu/en/publications/Publications/100219_EISN_Weekly_Influenza_Surveillance_Overview.pdf

Fukuda has said that it is concerned about a possible mutation of the swine flu virus into a hybrid bird flu virus, and this is one reason for maintaining the pandemic emergency level.

Indeed, WHO-affiliated scientist Bruno Lina is working on bioengineering just such a lethal combination in an Inserm lab in Lyon, according to a report in Nature. However, the emergence of any new, hybrid virus will make the current vaccines useless.

The emergency committee headed by Mackenzie is to meet again in a few weeks to reassess its decision.

A financial meltdown in Europe, a false flag terrorist event, a cyberattack or a war against Iran could create the kind of turmoil in which WHO might hope to implement another vaccination campaign.

Swine Flu Casualties Far Below White House Projections, Latest Mortality Data Show

CNS News, 26 February 2010

https://web.archive.org/web/20100301011204/http://www.theflucase.com/index.php?option=com_content&view=article&id=2836%3Aswine-flu-casualties-far-below-white-house-projections-latest-mortality-data-show&catid=41%3Ahighlighted-news&Itemid=105&lang=en

(CNSNews.com) – New statistics on the H1N1 swine flu strain show that it is no longer a "pandemic" in the United States, and that fatalities here never came close to the levels projected by the White House last fall.

As of Feb. 14, the World Health Organization (WHO) reported that more than 212 countries and overseas territories or communities have reported laboratory-confirmed cases of "pandemic influenza H1N1 2009," and 15,921 deaths have been confirmed worldwide.

Outbreaks in North and South America are now at a low level, WHO said.

"In the Americas, both in the tropical and northern temperate zones, pandemic influenza virus continues to circulate at low levels but overall pandemic influenza activity continued to decline or remain low in most places," the WHO report added.

Meanwhile, H1N1 cases and fatalities in the United States are no longer occuring at an epidemic level, according to the federal Centers for Disease Control and Prevention in Atlanta, and are far below the levels that had been predicted in 2009.

The CDC reported on Feb. 12 that an estimated 8,330 to 17,160 people have died in the U.S. alone since the H1N1 "swine flu" virus first broke out in April 2009.

For H1N1 (Swine Flu) related deaths, the mid-level in the range was about 11,690, the CDC said.

The CDC also estimated that between about 183,000 and 378,000 H1N1-related hospitalizations occurred between April and Jan.16 of last year.

The CDC numbers differ from the WHO statistics because the U.S. agency said it stopped reporting "laboratory confirmed" cases in 2009. The CDC now only reports "estimates" of flu-related hospitalizations and deaths from influenza.

"Early in the 2009 H1N1 outbreak, CDC did collect information related to 2009 H1N1 cases, but on July 24, 2009, states discontinued reporting of individual cases of 2009 H1N1 because as the outbreak expanded, individual case counts become increasingly impractical and not representative of the true extent of disease," according to the CDC Web site.

"For this reason, definitive counts of how many people have become infected with 2009 H1N1 are not available. However, CDC developed a method to provide an estimated range of the total number of 2009 H1N1 cases, hospitalizations and deaths in the United States," the public health agency said.

Still, U.S. estimates fall significantly below the average number of 36,000 fatalities the government says typically occur each year from seasonal flu.

The CDC estimates are also well below the White House projection last fall that a low of 30,000 deaths to a maximum of 90,000 could be expected.

On Aug. 24, the President's Council of Advisors on Science and Technology (PCAST) – a panel chaired by White House Science Czar John P. Holdren -- released a report assessing H1N1 preparations. This report suggested that anywhere between "30,000 and 90,000" people could possibly die as a result of the flu.

The PCAST report stated, "While the precise impact of the fall resurgence of 2009-H1N1 influenza is impossible to predict, a plausible scenario is that the epidemic could:

"– produce infection of 30-50 percent of the U.S. population this fall and winter, with symptoms in approximately 20-40 percent of the population (60-120 million people), more than half of whom would seek medical attention.

"– lead to as many as 1.8 million U.S. hospital admissions during the epidemic, with up to 300,000 patients requiring care in intensive care units (ICUs). Importantly, these very ill patients could occupy 50-100 percent of all ICU beds in affected regions of the country at the peak of the epidemic and could place enormous stress on ICU units, which normally operate close to capacity.

"– cause between 30,000 and 90,000 deaths in the United States, concentrated among children and young adults. In contrast, the 30,000-40,000 annual deaths typically associated with seasonal flu in the United States occur mainly among people over 65. As a result, 2009-H1N1 would lead to many more years of life lost."

In October of 2009, President Obama signed a proclamation declaring H1N1 a "national emergency" as the "rapid increase in illness" continued.

As noted, the CDC now is reporting that, in the United States, between 8,330 to 17,160 people have died from H1N1 since the virus first broke out in April 2009, and that the mid-level in the range was about 11,690 deaths.

THE FLU CASE

WHO Hypes Swine Flu Pandemic in Africa

The Flu Case, 27 February 2010, 15:36
https://web.archive.org/web/20100301011214/http://www.theflucase.com/index.php?option=com_content&view=article&id=2850%3Awho-hypes-swine-flu-pandemic-in-africa&catid=41%3Ahighlighted-news&Itemid=105&lang=en

In sun-soaked Africa, the flu is the least of the worries facing people who have to cope with wars, regional conflicts, life threatening famines, undernourishment and other diseases such as malaria.

Nevertheless, the WHO is now hyping the threat of a swine flu pandemic on the continent in preparation for a mass vaccination campaign with the untested and toxic swine flu jabs.

The African Regional Office of the World Health Organization (WHO) has now reported first nine cases of swine flu in Niger as the scare mongering campaign gains momentum.

The up coming World Cup in South Africa would provide a good opportunity for anyone planning to dramatise an outbreak of a more virulent swine flu in order to drive people to take the vaccine.

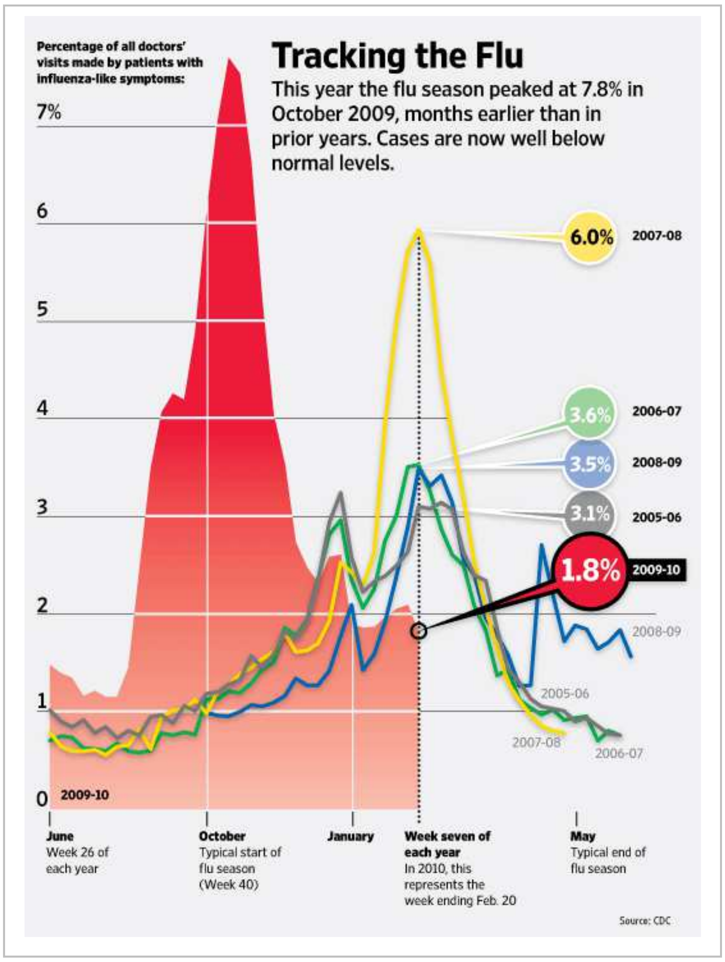
The Flu Season that Fizzled: Cases of H1N1 have Dwindled, Seasonal Flu has been a no-show and Doctors wonder Why

WSJ, 2 March 2010, 12:01 am ET
https://www.wsj.com/articles/SB10001424052748703429304575095743102260012

This has been a flu season like few others.

Normally at this time of year, influenza is rampant in the U.S., prompting hundreds of thousands of people to stay home in the dead of winter with fever, aches and pains.

Now, after raging through college campuses and communities last summer and fall, cases of the new H1N1 swine flu virus have dwindled to a trickle, and run-of-the-mill seasonal flu has barely made an appearance. Not one state reported widespread flu illness to the Centers for Disease Control and Prevention for the week ended Feb. 20, the latest data available. The percentage of all doctors' visits by patients with influenza-like symptoms has dropped from a high of 7.8% in late October – the largest peak since the agency began surveillance in 1997 – to 1.8% in late February, well below the norm for flu season.



Doctors and flu experts say the lull is unusual. "This is typically the peak of flu," said James Turner, executive director of the University of Virginia's department of student health. He said the Charlottesville, Va., student health center usually sees as many as 130 students a week complaining of flu symptoms this time of year. Recently, no more than three to five students a week have been coming in with fever, cough or other signs of flu, he said.

It is not clear why there is so little flu, particularly swine flu, going around, experts say. "Surely there's a sufficient number of people who haven't been infected or vaccinated," said Michael Osterholm, director of the Center for Infectious Disease Research and Policy at the University of Minnesota.

Many scientists say the answer probably has to do with how the flu virus progresses. Influenza comes and goes in waves, normally running from October through May. But pandemic viruses – new viruses that emerge and spread quickly around the globe – often move to a different rhythm, and can reach their busiest stage at unusual times like summer and early fall, although the reason for this isn't understood. Flu has peaked in late February or early March in 20 of the past 26 flu seasons, said Lyn Finelli, the CDC's chief of flu surveillance and outbreak response. But the latest swine flu wave started in August, and peaked in late October, before waning.

Widely publicized preventive measures such as hand washing, and the large national vaccination effort thus far, may also have played a role in the sharp drop off in H1N1 infections, but it is not clear by how much, said Anthony Fiore, a medical epidemiologist with the CDC's influenza division.

By mid-January, swine flu had sickened about 57 million people in the U.S. and killed roughly 11,700 – mostly young adults and children – from the time it emerged in late April through mid-January. Young people who ordinarily fight off flu easily ended up in intensive care units on advanced life support. Pregnant women, children, and other people at risk of flu complications stood in line for hours for vaccine, as slow production and delays prompted limited supplies.

In past years, when seasonal flu was the big worry, influenza has typically sickened about 25 million people a year, and directly killed about 8,000, according to the CDC.

The H1N1 flu virus hasn't disappeared, and another wave could still come this winter. "We've had peaks [of flu] as late as May, so we're not out of the woods yet," said Dr. Fiore of the CDC's influenza division. The virus could also mutate, spawning more new infections, though it hasn't done so yet. Flu experts estimate that more than half the country's population may still be vulnerable to the H1N1 virus, either because they haven't been sick or gotten vaccinated.

Some recent statistics could be warning signals. A few states have reported small increases in the percentage of doctors' visits by patients with flu-like symptoms. And the American College Health Association reported for the week ending Feb. 19 its first uptick in swine flu cases on college campuses since mid-December, to 4.1 cases per 10,000 from 2.7 cases per 10,000.

Dr. Turner, who is also president of the ACHA, said the organization plans to decide along with the CDC after getting more data this week whether to warn colleges to promote prevention measures to thwart a new wave that may be on its way. He said he is concerned that college students traveling on spring break could bring the disease back with them to campus. "If there's anytime we're going to see an increase in disease activity, I'd say March or early April is the time," he said.

U.S. and global health officials have recommended that the new H1N1 virus be included as one of three strains in next season's flu vaccine. The CDC's vaccine advisory panel also expanded its recommendation for who should get flu shots to include young and middle-aged adults, among whom death rates from the new H1N1 virus have been higher than for the elderly or children. The change means that all Americans now will be encouraged to get flu shots when the next vaccine is ready in September.

The unusual course this flu season is taking isn't one that public health officials are eager to repeat. Not knowing when the next flu outbreak could occur will mean staying on high alert for much of the year. It would also mean another rush to get vaccine distributed quickly. The CDC, which normally starts tracking flu hospitalizations and deaths in October, will continue to monitor them this spring, summer, and early fall. "We're going to make sure when it hits, we know about it and can describe it," Dr. Finelli said.

Nancy Cox, the CDC's influenza chief, told a vaccine advisory panel last week that the pandemic H1N1 virus is likely to eventually become a seasonal strain, though it is not one yet. Globally, the pandemic virus is still circulating in tropical countries and some parts of Europe, but is waning in most places, according to the World Health Organization.

Flu experts say they don't know why there is so little seasonal flu circulating this year. One theory doctors are debating is that people infected with H1N1 swine flu may produce a chemical in their bodies that protects them against other flu viruses.

The new virus doesn't appear to have completely muscled out other flu viruses, as some past pandemic viruses have. While one seasonal strain appears to have succumbed to the new tide of H1N1, another that is considered particularly hard on the elderly – H3N2 – has continued to circulate in pockets of the globe, albeit in small amounts.

While relatively few people are currently seeking out H1N1 shots, the CDC isn't giving up on promoting the vaccine this winter. About 155 million doses of H1N1 vaccine have been distributed so far this flu season, and about 86 million people have been vaccinated – a few million less so far than normally get vaccinated for seasonal flu. The agency is especially urging parents with children under 10 who have only had one dose to get a second, which it says is needed for full protection.

Even if a new wave of H1N1 illness occurs, some experts believe it won't be as large as the one last fall.

That's because millions more people have become immune either through infection or vaccination. "I think we'll have scattered outbreaks in communities that didn't have it," said Dr. Finelli.

The Daily Illini

Phil Johnson

Widespread illness: fluke or actual flu?

The Daily Illini (Urbana, IL), 3 March 2010, V 139, N 112, p. 4A
https://www.newspapers.com/image/757918582/?terms=%22with%20enormous%20numbers%20of%20deaths%20and%20illness%22&match=1

The bitter irony is best taken with strong drink. The pharmaceutical empires were about to be forcibly and politically injected with an antigluttony serum, but they got a hold of the needle first. Petrified by the prospect of becoming their gated communities' poor kids, they altered the cure and stuck anyone they could on their filthy green medical play-ground. Their lunacy and fear turned most of us into crazed hypochondriacs while the only virus around was a legendary strain of greed. Healthy skepticism was the antidote, but when dirty words like "conspiracy" and "theory" are listed as common side effects by the very ones profiting, things get weird.

Our "progressive" Robin Hood of a President trotted out scientists projecting 120 million American swine fluke infections – we're gonna lose 90,000 to this thing. Did he know he was being had or was he so naive? Either hurt. The World Health Organization said a third of the world would catch it, and hundreds of thousands would perish. While many college students called the puppet organization's bluff, world leaders were not about to ruin their political careers just in case this one happened to be real – remember the devastation SARS and the Avian Fluke wreaked? Bird Fluke has claimed 282 lives to date, and cannot even spread from person to person.

Swine fluke was announced to he a pandemic in June and soon after Big Pharma saw approximately $10 billion in profit. The U.S. flushed $2 billion into the scam. Fear definitely muddles the mind, but greed is worse. Someone in our government must have been aware that WHO changed their definition of a pandemic only one month prior to "outbreak." What was once "simultaneous epidemics worldwide with enormous numbers of death and illness" became "pandemics can be either mild or severe in the illness they cause." As director of WHO's Collaborating Centre for Epidemiology, Dr. Ulrich Keil said the severity of a disease no longer mattered. The redefinition becomes even more confusing when you read on the WHO Web site that there are "annual epidemics" of seasonal flu that claim between 250,000 and 500,000 lives. Else-where the Web site states swine fluke has only killed 14,000 worldwide, 4,000 in the U.S. – only a ninth of typical annual U.S. seasonal flu victims. Couldn't these guys have contracted the Bush administration for help on successfully covering up a fear campaign?

All that mattered was return-ing an investment. In this case it was the $4 billion investment Big Pharma had already made on swine fluke vaccine patents before swine fluke was so blatantly falsely labeled as a pandemic. Maybe at one point these pigs did think swine fluke would strike the way they projected, but when it didn't, they sure as hell were not going to be the ones left holding millions of useless vaccines. So they pulled some strings and their puppet turned the profiteering fear machine on. According to the Harvard School of Public Health, WHO overestimated the deadliness of swine fluke somewhere between 40 and 250 times. An honest mistake by the greatest medical minds in the world, right?

The Council of Europe, the oldest international organiza-tion working toward European integration, launched an investigation into the get-even-rich-er-quick scam late last month. Addressing the Council, Dr. Keil criticized the "hysterical announcements and reactions of ministries, scientific bodies and not least the media sharply contrasting with the mounting epidemiological evidence of a mild viral infection..." All about spreading the fear, CNN, ABC, MSNBC and even the bastion of unbiased reporting, FOX News, have done little reporting on the investigation for the truth. Surely Big Pharma has no impact on the media's portrayal of this grand scheme. What stings the worst is the availability of the answers. WHO acknowledges that their swine scientists have private sector associations. However, before each meeting, scientists are asked to declare all possible conflicts of interest. What a farce. A glance at WHO's 2008-2009 budget shows that $958 million of their funding comes from the UN, while $3.2 billion comes from decidedly involuntary investments they like to call "voluntary donations." My generation was right about this. We smelled the horsecrap fresh out of the gate. Our college quarantine leaves us relatively immune to the greed pandemic. Out in the "real world", the patients run the madhouse and they create fake diseases to further their pursuit of arbitrarily valuable pieces of paper, the ultimate root of this sickening psychosis.

THE FLU CASE

US extends pandemic emergency to 2012

The Flu Case, 8 March 2010, 13:15
https://web.archive.org/web/20100322201039/http://www.theflucase.com/index.php?option=com_content&view=article&id=2944:us-extends-pandemic-emergency-to-2012&catid=1:latest-news&Itemid=64&lang=en

Eileen Danneman has uncovered document showing that the US Health and Human Services secretary Kathleen Sebelius has extended the pandemic emergency to 2012 on March 5th, 2010, with little or no attention from the media.

"Sebelius: HHS document Extending the Pandemic to 2012 (Federal Register March 5, 2010) Therefore, pursuant to section 319F-3(b) of the Act, I have determined there is a credible risk that the spread of pandemic influenza A viruses and those with pandemic potential and resulting disease does or could constitute a public health emergency.

Section 319F-3(a)(4)(A) confers immunity to manufacturers and distributors of the Covered Countermeasure, regardless of the defined population.
...and amended on September 28, 2009 to provide targeted liability protections for pandemic countermeasures to enhance distribution ... and extends through February 28, 2012.

Chronik einer Hysterie

Spiegel, 8 March 2010, 14:12 Uhr
https://www.spiegel.de/spiegel/a-682149.html

Fast ein Jahr lang hielt die Schweinegrippe die Welt in Atem. Eine gigantische Impfkampagne sollte ihr Einhalt gebieten. Dabei handelte es sich nur um einen eher harmlosen Virenstamm. Wie konnte es zu solch einer Überreaktion kommen? Eine Rekonstruktion.

Anfangs sieht es wirklich nicht gut aus für Edgar. Der Fünfjährige glüht vor Fieber. Er mag nicht mehr essen, sein Rachen brennt, ihn schmerzt der ganze Körper.

Rasch stehen für die Leute in dem mexikanischen Dorf La Gloria die Schweine unter Verdacht. Die sind ein Fluch, davon sind sie hier seit langem überzeugt. Allein im nahen Städtchen Perote werden eine halbe Million Schweine gemästet. Von dort bläst der Wind den Gestank durch die Gassen der umliegenden Dörfer. Ist es da ein Wunder, dass Edgar Hernández zu fiebern begann?

Doch dann, nach nur vier Tagen, berappelt sich der Junge wieder. Seine Krankheit ist ebenso plötzlich verschwunden, wie sie aufgetaucht war. Eine Grippe, sonst nichts. Bald schon redet niemand in La Gloria mehr darüber.

Erst Wochen später wird ein Labor in Kanada einen Schleimhautabstrich des Jungen untersuchen. Das Ergebnis macht ihn berühmt: Edgar hatte keine gewöhnliche Grippe. Er war mit einem neuartigen Erreger infiziert - dem Schweinegrippe-Virus. Edgar geht als "niño cero" in die Geschichte ein, als erster Mensch, der an der neuen Seuche erkrankte.

Der Infekt des mexikanischen Jungen verlief glimpflich - ebenso wie bei den allermeisten der Millionen Menschen weltweit, die sich in den folgenden Monaten anstecken sollten. Und deshalb wäre das neue Virus wohl unbeachtet geblieben, gäbe es die moderne molekulare Medizin nicht, mit ihren Genanalysen, Antikörpertests und Referenzlabors. Die Schweinegrippe hätte die Welt erobert, und kein Arzt hätte etwas davon gemerkt.

Doch es kam anders. Denn es gibt sie, die Hightech-Medizin und die Impfstoffindustrie. Ebola, Sars, Vogelgrippe: Systematisch haben Seuchenwächter, Medien, Ärzte und Pharmalobby die Welt mit düsteren Katastrophenszenarien eingestimmt auf die Gefahr neuer, bedrohlicher Infektionskrankheiten.

Und keiner von diesen wird mehr Aufmerksamkeit gewidmet als der Influenza: Verteilt auf 102 Länder lauern Forscher in mehr als 130 Labors weltweit auf neue Grippe-Erreger. Karrieren, ganze Institutionen und sehr viel Geld hängen daran. "*Manchmal kommt es mir vor, als hätten manche geradezu Sehnsucht nach einer Pandemie*", konstatiert der Grippe-Experte Tom Jefferson von der internationalen Cochrane Collaboration. "Alles, was es jetzt brauchte, um diese Maschinerie in Gang zu bringen, war ein kleines mutiertes Virus."

Nun endlich war es also aufgetaucht, und die Maschinerie setzte sich in Bewegung. Die Forscher machten sich daran, die molekulare Gestalt des Virus aufzuklären. Die Pharmaindustrie begann an Impfstoffen zu tüfteln. Und die Behörden schmiedeten Katastrophenpläne. Nur eines ignorierten sie alle: *dass der neue Erreger eigentlich ziemlich harmlos war*. **Wie nur war so etwas möglich**?

24. APRIL 2009, WHO-Zentrale in GENF

Kurz nach Mitternacht bekommt Keiji Fukuda, Grippe-Spezialist der Weltgesundheitsorganisation (WHO), jenen Anruf, der die Maschinerie zum Laufen brachte. Am anderen Ende der Leitung meldet sich Nancy Cox aus Atlanta, die oberste Grippe-Expertin der US-Seuchenkontrollbehörde CDC.

Fukuda und Cox kennen sich. Gemeinsam haben sie einst gegen die asiatische Vogelgrippe gekämpft. Sie können sich noch gut daran erinnern, wie der aggressive Killer in Hongkong aufgetaucht war. Jeder Dritte, der sich damals ansteckte, starb. Die Angst, dass solch ein Erreger dauerhaft auf den Menschen überspringen könnte, sitzt Fukuda noch heute in den Knochen.

Deshalb ist ihm sofort klar, was dieser Anruf bedeuten kann: den Beginn einer neuen verheerenden Pandemie. 2,0 bis 7,4 Millionen Menschen weltweit, so die Schätzung der WHO, könnten sterben - einen eher milden Verlauf vorausgesetzt. Sollte sich das neue Virus als ähnlich aggressiv erweisen wie jenes, das 1918 die Spanische Grippe auslöste, könnten es sogar Zigmillionen Opfer werden.

"Das Erste, was ich dachte, war: Wir müssen jetzt schnell handeln", sagt Fukuda. Sofort ruft er WHO-Generaldirektorin Margaret Chan an, auch sie eine Veteranin im Kampf gegen die Vogelgrippe. Als Leiterin der Hongkonger Gesundheitsbehörde war sie es seinerzeit gewesen, die alle Hühner der Stadt töten ließ.

Um 3.15 Uhr weckt ein Anruf auch den IT-Spezialisten Jered Markoff, der für das Strategic Health Operations Centre, den sogenannten Shoc Room, verantwortlich ist. Noch von zu Hause aus aktiviert Markoff diese Krisenoperationszentrale der WHO. Über seinen Heimcomputer fährt er die 15 in den Tischen versteckten Monitore aus, er startet die Rechner und wirft die an den Wänden angebrachten Großbildschirme an. Dann fährt er selbst in die WHO-Zentrale.

Monatelang wird der Shoc Room das Zentrum des weltweiten Kampfes gegen die Schweinegrippe sein. Er ist 24 Stunden lang besetzt, in drei Schichten wechseln sich die WHO-Mitarbeiter ab. Per Videokonferenz sind sie mit Ärzten, Wissenschaftlern, Politikern und Industrievertretern auf der ganzen Welt verbunden. Auf den Bildschirmen an den Wänden laufen rund um die Uhr Nachrichten, es werden Grafiken präsentiert, Landkarten und Statistiken.

Wie schnell verbreitet sich das Virus?

Noch ist die Lage sehr unübersichtlich: Zunächst ist von mehreren Dutzend Toten in Mexiko die Rede, bald darauf werden die Behörden diese Zahl auf vorerst sieben korrigieren. Die Seuchenschützer bewegen sich in einer wissenschaftlichen Grauzone: Die Informationen widersprechen sich, viele entscheidende Fragen sind noch offen. Wie schnell verbreitet sich das Virus? Welche Menschen sind besonders gefährdet? Schützt die normale Grippe-Impfung? Und vor allem: Wie gefährlich ist das neue Virus wirklich?

Um die bestmögliche Einschätzung zu bekommen, ruft WHO-Chefin Chan das "Emergency Committee", eine Gruppe von 15 handverlesenen Experten aus der ganzen Welt, zu einer ersten Telefonkonferenz zusammen. "Wir hatten in dieser frühen Phase noch zu wenig Informationen", erinnert sich der Australier John Mackenzie, der Vorsitzende des Komitees. "Aber alles, was wir damals wussten, hörte sich alarmierend an."

Heißt dies, dass ein sehr milder Verlauf der Pandemie von Anfang an gar nicht in Betracht gezogen wurde? Auf jeden Fall ist Abwiegeln unerwünscht: Die WHO will bei ihren Entscheidungen erklärtermaßen von einem Worst-case-Szenario ausgehen. "Wir wollten die Situation lieber über- als unterschätzen", sagt Fukuda.

Auch Mackenzie, ein erfahrener Seuchenschützer, ist es gewohnt, stets und überall Gefahr zu wittern. Mehrere Jahre war er beim Australian Biosecurity Cooperative Research Centre dafür verantwortlich, Australien vor neuen ansteckenden Krankheiten zu schützen. Bei seinem Abschied 2008 warnte er eindringlich vor der nächsten Grippe-Pandemie.

Vor allem aber ist es wohl das Schreckensbild der Vogelgrippe, das den Experten den Blick verstellt auf die Eigenheiten des neuen Erregers. In ihren Köpfen hat sich die Vorstellung eines höchst aggressiven Virus festgesetzt, das, einmal verbreitet, unweigerlich in die Katastrophe führt.

Auch die Medien befördern die Angst. Der SPIEGEL etwa hatte immer wieder über die Vogelgrippe berichtet. Nun widmet er dem neuen "Welt-Virus" eine Titelgeschichte, die geprägt ist von der Sorge, der Schweinegrippe-Erreger könne zum Horrorvirus mutieren.
https://www.spiegel.de/politik/angriff-aus-dem-schattenreich-a-93aab053-0002-0001-0000-000065243804?context=issue

Geschickt hat es besonders die Pharmaindustrie verstanden, diese Vision wachzuhalten. Eigens zu diesem Zweck finanzieren die Grippemittel- und Impfstoffhersteller einen eigenen Wissenschaftlerverband: die

European Scientific Working Group on Influenza, die regelmäßig Kongresse und Expertentreffen veranstaltet. An der Spitze der Lobbyvereinigung steht Albert Osterhaus vom Erasmus Medical Center in Rotterdam - der zugleich einer der einflussreichsten WHO-Berater in Sachen Grippe-Impfung ist.

Gemeinsam mit Osterhaus soll auch Johannes Löwer der WHO-Chefin Empfehlungen zum Thema Schweinegrippe-Impfung geben. Der damalige Präsident des für Impfstoffe zuständigen Paul-Ehrlich-Instituts (PEI) ist inzwischen selbst davon überzeugt, dass die Horrorszenarien der Vogelgrippe sein Denken wohl zu stark geprägt hätten, ebenso wie dasjenige seiner Expertenkollegen: "Wir waren in Erwartung einer richtigen Pandemie, wir dachten, die muss jetzt kommen. Da war keiner, der sagte, denkt noch mal nach."

27. April 2009: Die WHO ruft Pandemie-Warnstufe 4 aus. Das Virus wird also in mindestens einem Land von Mensch zu Mensch übertragen. +++

28. April 2009: In Deutschland gibt es die ersten sieben Fälle von Verdacht auf Schweinegrippe. +++

29. April 2009: Die WHO ruft Stufe 5 aus, die letzte Vorstufe zur Pandemie. Influenza-Forscher versetzt dies in Höchststimmung: "Eine Pandemie - das ist für uns Virologen so etwas wie für Astronomen die Sonnenfinsternis im eigenen Land", sagt Markus Eickmann, Leiter des BSL-4- Hochsicherheitslabors in Marburg.

30. April 2009: In Ägypten beginnt die Tötung sämtlicher Hausschweine des Landes. Brigitte Bardot bittet Staatspräsident Husni Mubarak vergebens, die Massentötung zu stoppen. +++

4. Mai 2009: In Mexiko haben die Fußballspiele der vier höchsten Ligen ohne Zuschauer stattgefunden. In der Verwaltung des saarländischen Landtags wird ein Verbot von Begrüßungsküsschen erlassen. +++

10. Juni 2009: Der WHO wurden inzwischen 141 Schweinegrippe-Todesopfer gemeldet. Die Mehrzahl von ihnen hatte schwere Vorerkrankungen. Meist jedoch verläuft die Infektion mild. Ein genesener Patient berichtet in der "Süddeutschen Zeitung": "Mein Hauptproblem war, wer einkaufen geht."

11. Juni 2009, WHO-Zentrale

Wieder einmal schaltet sich das Emergency Committee zu einer Telefonkonferenz zusammen. Diesmal geht es um die große, die alles entscheidende Frage: Soll die WHO Stufe 6 der Seuche ausrufen? Ist die Schweinegrippe eine Pandemie?

Stundenlang beraten die 15 rund um den Erdball verteilten Experten. Dann schließlich wendet sich Chan an die Presse. Das Virus sei unberechenbar und könne nicht gestoppt werden, sagt sie. Damit gilt offiziell: Der Grippepandemiefall ist eingetreten, erstmals seit 41 Jahren.

"Ich denke, wir haben alles richtig gemacht", sagt der Vorsitzende Mackenzie rückblickend. Und formal hat er damit sogar recht.

Denn die Regularien besagen, dass Stufe 6 in Kraft tritt, wenn sich ein neues Virus unkontrollierbar in mehreren Regionen der Erde verbreitet. Über die Schwere der Erkrankung sagen sie nichts.

Tatsächlich aber verbinden die allermeisten Seuchenexperten den Begriff der "Pandemie" automatisch mit wirklich aggressiven Viren. Auf der Website der WHO etwa ist in der Antwort auf die Frage "Was ist eine Pandemie?" von "einer enormen Anzahl von Todes- und Krankheitsfällen" die Rede - jedenfalls bis zum 4. Mai 2009. Dann machte ein CNN-Reporter die Seuchenschützer auf den Widerspruch zur eher mild verlaufenden Schweinegrippe aufmerksam, und diese Passage wurde umgehend getilgt.

Auch die deutschen Seuchenschützer haben die offizielle WHO-Definition der Phase 6 offenbar gründlich missverstanden. Bei einer Influenza-Pandemie, heißt es im 2007 aktualisierten nationalen Pandemieplan, handle es sich um "eine lang anhaltende, länderübergreifende Großschadenslage". Sie verursache "derart nachhaltige Schäden, dass die Lebensgrundlage zahlreicher Menschen gefährdet oder zerstört wird".

Davon kann am 11. Juni 2009 keine Rede sein. Kritiker fragen spöttisch, ob die WHO demnächst auch einen neuen Schnupfen zur Pandemie erklären wolle. "Manchmal denken einige von uns, WHO steht für Welt-Hysterie-Organisation", meint Richard Schabas, einstmals Gesundheitschef der kanadischen Provinz Ontario.

Als Chan ihre Entscheidung fällte, da wusste sie, dass Dutzende Staaten, darunter Großbritannien, China und Japan, eindringlich gewarnt hatten, nicht voreilig die Phase 6 zu verkünden. Hongkongs Gesundheitsminister hatte gefordert: "Das System der Pandemie-Phasen muss überarbeitet werden." Auch Seuchenwächter Mackenzie ist rückblickend dieser Meinung: "Wir brauchen ein Fein-Tuning von Phase 6, bei dem auch die Schwere der Erkrankung mitberücksichtigt wird." Sogar die WHO selbst denkt im Mai darüber nach, die Kriterien in diesem Sinne zu ändern - sieht dann jedoch wieder davon ab.

Die Warnungen verhallen. Warum? Weil Vorschrift nun einmal Vorschrift ist? Weil man lieber auf Nummer sicher gehen will? Fest steht: Eine Partei mit gutem Draht nach Genf hat ein überragendes Interesse daran, dass möglichst schnell Phase 6 ausgerufen wird: die Pharmaindustrie.

"Die Pharmaindustrie hat keine unserer Entscheidungen beeinflusst", sagt Fukuda. Doch Mitte Mai, rund drei Wochen bevor die Schweinegrippe zur Pandemie erklärt wird, treffen sich in der WHO-Zentrale 30 hochrangige Vertreter von Pharmakonzernen mit WHO-Chefin Chan und Uno-Generalsekretär Ban Ki Moon. Offiziell geht es darum, wie auch die Versorgung der Entwicklungsländer mit Pandemie-Impfstoff sicher-gestellt werden kann. Doch für die Impfstoffindustrie ist zu dieser Zeit etwas anderes die Schlüsselfrage: die Entscheidung für Phase 6.

Es geht um nichts Geringeres als die Versorgung großer Teile der Menschheit mit Grippe-Impfstoffen. Alles hängt an dieser Entscheidung: Phase 6 funktioniert wie ein Schalter, der die Kassen der Industrie risikofrei klingeln lässt. Denn viele Pandemie-Impfstoff-Verträge sind längst abgeschlossen. Deutschland etwa hat sich schon 2007 dem britischen Konzern GlaxoSmithKline (GSK) gegenüber verpflichtet, GSK-Pandemie-Impfstoff zu kaufen - sobald Phase 6 ausgerufen wird. Das mag erklären, warum Professor Roy Anderson, einer der wichtigsten wissenschaftlichen Berater der britischen Regierung, die Schweinegrippe sogar schon am 1. Mai zur Pandemie erklärte. Was er dabei nicht mitteilte: dass er ein Jahresgehalt in Höhe von mehr als 130 000 Euro von GSK bezieht.

Mitte Juni 2009: Der Deutschland-Chef des Impfstoffherstellers GSK ermahnt Gesundheitsministerin Ulla Schmidt, "die im Vertrag vorgesehene Belieferung dringend zu bestätigen". Die thüringische Gesund-heitsministerin fordert er auf, "uns die vertraglich fixierten Bestellungen der Bundesländer unverzüglich verbindlich zu bestätigen". Ähnliche Schreiben gehen an andere Länder.

+++

4. Juli 2009: Es wird bekannt, dass Rupert Grint an der Schweinegrippe erkrankt war: "Zuerst dachte ich, ich müsste sterben", sagt der Schauspieler, der in den "Harry Potter"-Filmen Ron Weasley spielt, "doch dann hatte ich nur Halsschmerzen." +++

14. Juli 2009: In Deutschland gibt es jetzt offiziell 727 Infizierte, gestorben ist keiner. +++

August 2009: Die australische Grippesaison geht zu Ende. Obwohl noch kein Impfstoff existiert, sind dort am Ende nur 190 Menschen gestorben, deutlich weniger als in einer normalen Grippesaison. +++

29. August 2009: Eine SPIEGEL-Umfrage ergibt: Nur 13 Prozent der Deutschen wollen sich impfen lassen.

7. September 2009, Thüringische Landesvertretung in Berlin

Sondergipfel in der Berliner Mohrenstraße. Nach und nach treffen die Gesundheitsminister der Länder ein. Es soll um die Frage gehen, ob noch mehr Impfstoff nachbestellt werden soll.

Alle, die gekommen sind, wissen: Es ist Wahlkampf in Berlin, und Ulla Schmidt hat unmissverständlich klargestellt: "Ich möchte, dass jeder, der sich impfen lassen will, auch geimpft werden kann." Und: "Ich erwarte, dass sich die Länder ihrer Verantwortung stellen." Auf keinen Fall will die Ministerin den Eindruck entstehen lassen, sie enthalte der Bevölkerung etwas vor.

Es ist ein warmer Nachmittag im Spätsommer, die Stimmung bei der Sondersitzung aber ist eisig. "Der Bund hatte im Vorfeld massiv Druck auf uns gemacht, mehr Impfstoff zu bestellen", sagt der Hamburger Gesundheitssenator Dietrich Wersich (CDU). "Dabei war uns allen klar, dass die Impfbereitschaft in der Bevölkerung äußerst gering war."

Denn inzwischen ist eine Debatte darüber entbrannt, ob Deutschland mit Pandemrix nicht auf den falschen Impfstoff gesetzt habe. Das Präparat enthält einen neuartigen Wirkverstärker, ein sogenanntes Adjuvans, das zusammen mit dem Schweinegrippe-Antigen noch nie in größerem Umfang an Menschen getestet worden ist. Eine Massenimpfung von Millionen Menschen mit einem kaum erprobten Impfstoff? "Das ist ein Großversuch an der deutschen Bevölkerung!", warnt Wolfgang Becker-Brüser, Herausgeber des "arznei-telegramms".

Theoretisch, sagt der ehemalige PEI-Chef Löwer, wäre es durchaus möglich gewesen, auch in Deutschland kurzfristig einen Adjuvans-freien Schweinegrippe-Impfstoff zuzulassen. Doch die Verträge über Pandemrix sind schon seit 2007 unterschrieben. Seit der WHO-Entscheidung für Phase 6 sind sie automatisch in Kraft getreten. Deutschland steckt in der Falle.

Missmutig debattieren die Länderminister: 50 Millionen Impfdosen, so meinen sie, seien doch schon bestellt, fast eine halbe Milliarde Euro hat die Länder das bereits gekostet. Ist es da wirklich nötig, noch mehr zu ordern?

Von allen Seiten fühlen sich die Minister unter Druck gesetzt: Zum einen schüren die Medien die Angst vor dem Virus. Vor allem die "Bild"-Zeitung verkündet fast täglich neue Horrorbotschaften. Zum anderen drängen die Pharmafirmen; immer wieder stellen sie Ultimaten.

Gut können sich die versammelten Minister noch daran erinnern, wie der Pharmakonzern Roche die Bundesländer zum Kauf des Grippemedikaments Tamiflu gedrängt hatte. Mit der Betreffzeile: "eilt: Angebot Roche" erreichte sie schon am 30. April um 15.28 Uhr eine E-Mail aus dem thüringischen Gesundheitsministerium: "Roche hat uns soeben mitgeteilt, dass sie noch über einen Bestand von 180 000 Packungen Tamiflu verfügen. Diesen Bestand stellen sie den Ländern bis heute spätestens 16.30 Uhr zur Verfügung, ansonsten werden mit dem Bestand andere Anfragen von Großhandel usw. bedient." Tatsächlich jedoch sind zu keiner Zeit ernsthafte Lieferengpässe bekanntgeworden.

"Mit bis zu 80.000 Todesfällen müsse gerechnet werden"

Aber auch von den Seuchenwächtern im Robert-Koch-Institut (RKI) und im Paul-Ehrlich-Institut geht Druck auf die versammelten Minister aus. "Wir haben uns damals miserabel beraten gefühlt", erinnert sich der Bremer Staatsrat Hermann Schulte-Sasse (SPD). "Die Institute haben uns nicht dabei geholfen, wenn es darum ging, Panikmache zu verhindern."

Immer wieder warteten RKI und PEI mit neuen Horrorzahlen auf. Mit bis zu 80.000 Todesfällen müsse gerechnet werden, hatte es noch im Juni geheißen, und mit einem "Produktionsausfall von 15 bis 45 Milliarden Euro".

Warum die Forscher ihnen denn nichts berichtet hätten über neue Studien, die darauf hinweisen, dass auch eine Einmalimpfung bei der Schweinegrippe auszureichen scheint, empört sich einer der Versammelten. Wenn das zutreffe, könnten die Länder schließlich viel Geld sparen. Denn dann würden die 50 Millionen bereits bestellten Dosen nicht nur für 25 Millionen, sondern für 50 Millionen Menschen ausreichen, eine Nachbestellung wäre damit überflüssig.

Alle Blicke sind nun auf RKI-Chef Jörg Hacker gerichtet. "Die Stichproben sind bisher viel zu klein gewesen", wiegelt dieser ab. Hacker mag solche Situationen nicht. Er ist Wissenschaftler, kein Politiker.

Wenn eine einzige Impfdosis jedoch ausreicht, dann würde dies nicht nur viel Impfstoff sparen. Es wäre zugleich auch ein starker Hinweis darauf, dass die Bevölkerung dem Virus keineswegs wehrlos ausgeliefert ist. Die Gefahr, die von der Schweinegrippe ausgeht, könnte also deutlich kleiner sein als gedacht.

Doch bei keinem im Saal kommt diese Botschaft der Entwarnung an. Am Ende beschließen die Minister widerwillig, beim Pharmakonzern Novartis die Option auf weitere 18 Millionen Impfdosen offenzuhalten.

9. Oktober 2009: Wolf-Dieter Ludwig, Onkologe und Vorsitzender der Arzneimittelkommission der deutschen Ärzteschaft, erklärt: "Die Gesundheitsbehörden sind auf eine Kampagne der Pharmakonzerne hereingefallen, die mit einer vermeintlichen Bedrohung schlichtweg Geld verdienen wollten." +++

21. Oktober 2009: In giftigem Gelb warnt die "Bild"-Schlagzeile: "Schweinegrippe-Professor befürchtet in Deutschland 35 000 Tote!" Der Professor heißt Adolf Windorfer, und auf Nachfrage gibt er zu, unter anderem von GSK und Novartis Geld zu erhalten. Neben der "Bild"-Schlagzeile prangt eine Anzeige des Verbands Forschender Arzneimittelhersteller. +++

28. November 2009: Die Schweinegrippe in Deutschland flaut ab. Kaum jemand will sich noch impfen lassen. +++

8. Dezember 2009: Auf Englands vereisten Straßen wird das Streugut knapp. Paul Flynn, Labour-Abgeordneter im britischen Parlament, schlägt vor, die staatlichen Tamiflu-Vorräte zum Streuen zu verwenden. Eine Untersuchung der Cochrane Collaboration hatte gezeigt, dass die Wirkung des Grippemittels nur schwach ist. +++

7. Januar 2010: RKI-Präsident Hacker warnt vor einer neuen Grippewelle. "Der Impfstoff ist nach wie vor notwendig, das Virus ist ja auch noch unter uns." +++

26. Januar 2010: Der deutsche Abgeordnete Wolfgang Wodarg kritisiert im Europarat in Straßburg, dass weltweit "Millionen Menschen ohne einen guten Grund geimpft" wurden. Die Ausrufung der Pandemie durch die WHO habe den Pharmakonzernen 18 Milliarden Dollar Zusatzeinnahmen in die Kassen gespült. Allein der Jahresumsatz des Grippemittels Tamiflu ist um 435 Prozent auf 2,2 Milliarden Euro gestiegen. +++

5. März 2010: Die Bundesländer wollen zehn Millionen überflüssiger Dosen des Schweinegrippe-Impfstoffs Pandemrix an Pakistan verkaufen.

ANFANG MÄRZ 2010, WHO-ZENTRALE IN GENF

Der Shoc Room wird inzwischen längst für andere Notfälle gebraucht. Hilfe für Haiti etwa wurde von hier aus koordiniert. Doch oft steht der Raum auch einfach leer.

Die Stimmung bei der WHO hat sich inzwischen merklich entspannt. Die Presseabteilung ist längst nicht mehr rund um die Uhr besetzt. Das Journalistenzelt auf dem Mitarbeiterparkplatz ist abgebaut. IT-Spezialist Jered Markoff kann wieder durchschlafen. Und der Grippe-Experte Keiji Fukuda ist froh, dass er sich wieder seinem Hobby, dem Cellospiel, widmen kann.

Was ist diese Pandemie also gewesen? Alles nur "eine gute Übung für den Ernstfall", wie es der WHO-Berater und Industrielobbyist Osterhaus formuliert? Haben die Behörden alles richtig gemacht, wie der australische Seuchenwächter John Mackenzie meint?

Sicher nicht. Niemand bei WHO, RKI oder PEI kann stolz auf sich sein. Diese Behörden haben kostbares Vertrauen verspielt. Denn wer wird ihren Einschätzungen bei der nächsten Pandemie jetzt noch Glauben schenken?

Vielleicht hätten sich alle ein Beispiel nehmen sollen an Ewa Kopacz, der polnischen Gesundheitsministerin. Die 53-Jährige ist von Beruf Ärztin und Mitglied der liberalen Bürgerplattform. Sie hat den Ruf, keinem Streit aus dem Weg zu gehen.

Als sie in der großen Impfstoffdebatte ans Rednerpult des Sejm trat, hatte sie ein knallrotes Kleid angelegt, eine Kampfmontur: "Als Ärztin ist mein oberster Grundsatz, niemandem zu schaden", sagte sie. Deshalb werde Polen sich gegen den Rest Europas stellen: "Wir werden keinen Impfstoff gegen die Schweinegrippe kaufen."

Die Volksvertreter murrten, doch Polens Gesundheitsministerin blieb hart: "Ist es meine Pflicht, Verträge zu unterschreiben, die im Interesse der Polen liegen oder im Interesse der Pharmakonzerne?"

Inzwischen blickt Europa neidisch auf ihre Standfestigkeit. Rund 170 Menschen sind in Polen an der Schweinegrippe gestorben, weitaus weniger, als die saisonale Grippe jedes Jahr dahinrafft.
+++

Auf dem Dorfplatz von La Gloria im Mexikanischen Hochland wurde inzwischen eine 1,30 Meter große und 70 Kilogramm schwere Bronzestatue errichtet - ein Abbild von Edgar Hernández, dem Wunderknaben, der die Schweinegrippe besiegte.

The Swine Flu Panic of 2009

Spiegel, 12 March 2010, 14:12 Uhr
https://www.spiegel.de/international/world/reconstruction-of-a-mass-hysteria-the-swineflu-panic-of-2009-a-682613.html

Swine flu kept the world in suspense for almost a year. A massive vaccination campaign was mounted to put a stop to the anticipated pandemic. But, as it turned out, it was a relatively harmless strain of the flu virus. How, and why, did the world overreact? A reconstruction.

At first things did not look good for Edgar. The five-year-old boy had a high fever. He'd lost his appetite, his throat was burning and his entire body ached.

The people in the Mexican village of La Gloria were quick to blame the pigs. They had long been convinced that the animals were a curse. In the nearby town of Perote, half a million hogs were being fattened for slaughter. The wind carried the stench through the narrow streets of the surrounding villages. No one was very surprised when Edgar Hernandez fell ill.

But then, after only four days, the boy recovered. His illness disappeared as quickly as it had started. It turned out to be nothing more than the flu, and the people of La Gloria soon forgot about it.

'Boy Zero'

It wasn't until several weeks later that a laboratory in Canada tested a mucosal smear taken from the boy. The results made him famous. Edgar didn't have an ordinary flu, but had been infected with a new kind of pathogen, the swine flu virus. Edgar went down in history as *niño cero*, "boy zero," the first person to fall ill with the new plague.

The Mexican boy's infection was mild, like an overwhelming majority of the millions of cases that would occur worldwide in the coming months. The new virus would probably have attracted far less attention if it hadn't been for modern molecular medicine, with its genetic analyses, antibody tests and reference laboratories. The swine flu would have conquered the world, and no doctor would have noticed.

But the world did notice, largely because of high-tech medicine and the vaccine industry. From Ebola to SARS to the avian flu, epidemiologists, the media, doctors and the pharmaceutical lobby have systematically attuned the world to grim catastrophic scenarios and the dangers of new, menacing infectious diseases.

None of these diseases receives more attention than influenza. Researchers in more than 130 laboratories in 102 countries are constantly on the lookout for new flu pathogens. Entire careers and institutions, and a lot of money, depend on the outcomes of their work. "Sometimes you get the feeling that there is a whole industry almost waiting for a pandemic to occur," says flu expert Tom Jefferson, from an international health nonprofit called the Cochrane Collaboration. "And all it took was one of these influenza viruses to mutate to start the machine grinding."

Now turned up, the machinery was set into motion. Researchers got to work examining the molecular structure of the virus. The pharmaceutical industry started to develop vaccines. Government agencies laid out disaster plans. There was only one thing that everyone was ignoring: The new pathogen was, in fact, relatively harmless. How did all this happen?

April 24, 2009: WHO Headquarters in Geneva

Shortly after midnight Keiji Fukuda, an influenza specialist with the World Health Organization (WHO), received a phone call from Nancy Cox, the chief of the influenza division at the United States Centers for Disease Control (CDC) in Atlanta.

Fukuda and Cox had once worked together to fight the Asian bird flu. Both scientists remembered all too well how the aggressive killer surfaced in Hong Kong. A third of those infected with the virus died. To this day, Fukuda retains the fear that a similar pathogen could permanently make the jump to humans.

So the potential significance of the call was clear to Fukuda: the start of a devastating pandemic, in which, according to WHO estimates, between 2.0 and 7.4 million could die -- assuming the pandemic was relatively mild. But if the new virus proved to be as aggressive as the one that triggered the Spanish Flu in 1918, the death toll could run to the tens of millions.

"The first thing I thought was: We have to act quickly," says Fukuda. He immediately called WHO Director-General Margaret Chan, another veteran of the fight against avian flu. As Hong Kong's director of health at the time, she was the one who ordered the slaughter of all chickens in the city.

It specialist Jered Markoff, in charge of the WHO's Strategic Health Operations Center – also known as the SHOC room -- received a call at 3:15 a.m. Markoff activated the SHOC room from home: Using his personal computer, he issued the necessary commands to pull out the 15 monitors hidden in tables, start up the computers and switch on the large projection screens attached to the walls. Then he drove to WHO headquarters.

For the next few months, the SHOC room would serve as the center of the worldwide battle against H1N1, the swine flu virus. It was staffed 24 hours a day with three rotating shifts of WHO employees, who used videoconferencing equipment to communicate with doctors, scientists, politicians and industry representatives around the world. News, charts, maps and statistics were constantly popping up on the projection screens.

The situation was still confusing. At first, there was talk of several dozen dead in Mexico, but soon the authorities adjusted that number downward to seven. The epidemic experts were moving in a scientific gray area, filled with contradictory information and many unanswered questions. How fast does the virus spread? Which people are at the greatest risk? Does the normal influenza vaccine provide protection? Most of all: Just how dangerous is the new virus?

To obtain the best possible assessment, WHO Director-General Chan convened the "Emergency Committee," a group of 15 carefully selected experts from around the world, for a first teleconference. "In that early phase, we still had too little information," says Australian John Mackenzie, the chairman of the committee. "But everything we knew at the time sounded alarming."

Worst-Case Scenarios

Does this mean that a very mild course of the pandemic was not even considered from the start? At any rate, efforts to downplay the risks were unwelcome, and the WHO made it clear that it preferred to base its decisions on a worst-case scenario. "We wanted to overestimate rather than underestimate the situation," says Fukuda.

Mackenzie, another veteran in fighting epidemics, is accustomed to smelling trouble around every corner. He worked for the Australian Biosecurity Cooperative Research Centre for several years, where he was responsible for protecting Australia from new infectious diseases. When he left the Centre in 2008, he issued an emphatic warning about the next influenza pandemic.

Most of all, however, it was probably the horrific images of the avian flu that distorted the experts' view of the idiosyncrasies of the new pathogen. The vision of a highly aggressive virus had become lodged in their minds, a virus that, once it began to spread, would lead to catastrophe.

The media also did its part in stoking fears. SPIEGEL, for example, had reported at length on the avian flu. Now it devoted a cover story to the new "global virus," a story filled with concerns that the swine flu pathogen could mutate into a horrific virus.

The pharmaceutical industry was particularly adept at keeping this vision alive. Manufacturers of flu remedies and vaccines even funded a group of scientists devoted solely to this issue: the European Scientific Working Group on Influenza, which regularly held conferences and meetings of experts. The lobbying group was headed by Albert Osterhaus of the Erasmus Medical Center in Rotterdam, who also happened to be one of the WHO's most influential advisors on influenza vaccines.

Together with Osterhaus, Johannes Löwer was asked to provide Director-General Chan with recommendations on the subject of swine flu vaccination. The then president of the Paul Ehrlich Institute (PEI), which specializes in vaccines, is now convinced that he and his fellow experts were probably too strongly influenced by the horror scenarios swirling around the avian flu. "We expected a real pandemic, and we thought that it had to happen. There was no one who suggested re-thinking our approach."

April 27, 2009: *The WHO raises its pandemic warning to phase 4, meaning it has discovered human-to-human transmission of the virus in at least one country.*

April 28, 2009: *The first seven suspected cases of swine flu are reported in Germany.*

April 29, 2009: *The WHO raises its warning to phase 5, the last stage before a pandemic. Influenza researchers are elated. "A pandemic – for virologists like us, it's like a solar eclipse in one's own country for astronomers," says Markus Eickmann, director of the BSL-4 high-security laboratory in the central German city of Marburg .*

April 30, 2009: *Egypt begins killing all domestic pigs in the country. French actress and animal rights activist Brigitte Bardot begs President Hosni Mubarak to stop the mass slaughter, but her appeals are unsuccessful.*

May 4, 2009: *In Mexico , football matches in the country's four highest-ranking leagues take place without spectators. The legislature in Germany 's western state of Saarland imposes a ban on kissing as a form of greeting.*

June 10, 2009: *The WHO has received reports of 141 swine flu deaths. The majority of the victims have serious pre-existing conditions. In most cases, however, the course of the infection is mild. A recovered patient tells a German daily newspaper, the Süddeutsche Zeitung, "My main problem was finding someone to go shopping for me."*

June 11, 2009 , WHO Headquarters

The Emergency Committee convened for another teleconference. This time the discussion focused on critical questions: Should the WHO raise its warning to phase 6? Was the swine flu a pandemic?

The 15 experts scattered around the world debated for hours. After the meeting, Chan told the press that the virus was unpredictable and unstoppable. It was official: An influenza pandemic had broken out for the first time in 41 years.

"I think we did everything right," committee chairman Mackenzie says, looking back. Strictly speaking, his statement is correct.

According to the regulations, phase 6 becomes effective when a new virus is spreading uncontrollably in several regions of the world. The regulations say nothing about the severity of the disease.

In fact, the vast majority of experts on epidemics automatically associate the term "pandemic" with truly aggressive viruses. On the WHO Web site, the answer to the question "What is a pandemic?" included mention of "an enormous number of deaths and cases of the disease" – until May 4, 2009. That was when a CNN reporter pointed out the discrepancy between this description and the generally mild course of the swine flu. The language was promptly removed.

Apparently German infectious disease experts also misunderstood the official WHO definition of phase 6. An influenza epidemic, according to Germany's national pandemic plan – updated in 2007 – is "a long-lasting, international situation involving substantial loss…and causing such lasting damage as to jeopardize or destroy the livelihood of large numbers of people."

The situation on June 11, 2009 did not correspond with these descriptions. Critics were already asking derisively whether the WHO had any plans to declare the latest outbreak of the common cold a pandemic. "Sometimes some of us think that WHO stands for World Hysteria Organization," says Richard Schabas, the former chief medical officer for Canada's Ontario Province.

'Fine-Tuning' the Definition of Pandemic

When Chan reached her decision, she knew that dozens of countries, including Great Britain, China and Japan, had warned against prematurely raising the warning phase to 6. Hong Kong's health minister had said: "The system of pandemic levels needs to be revised." Epidemiologist Mackenzie says, in retrospect: "We need to fine-tune phase 6 so that the severity of the disease is also taken into account." In May 2009, even the WHO itself considered amending the criteria in the way Mackenzie suggested, but then it changed its mind.

The warnings faded away. Why? Because regulations are simply regulations? Because health officials decided to err on the side of caution? One thing is clear, though. A party with strong connections in Geneva had a strong interest in phase 6 being declared as quickly as possible: the pharmaceutical industry.

"The pharmaceutical industry did not influence any of our decisions," says Fukuda. But in mid-May, about three weeks before the swine flu was declared a pandemic, 30 senior representatives of pharmaceutical companies met with WHO Director-General Chan and United Nations Secretary General Ban Ki Moon at WHO headquarters. The official reason for the meeting was to discuss ways to ensure that developing countries would be provided with pandemic vaccine. But at this point in time the vaccine industry was mainly interested in one question: the decision to declare phase 6.

Everything hung on this decision. At stake was nothing less than a move to supply large segments of the world's population with flu vaccine. Phase 6 acted as a switch that would allow bells on the industry's cash registers to ring, risk-free. That's because many pandemic vaccine contracts had already been signed. Germany, for example, signed an agreement with the British firm GlaxoSmithKline (GSK) in 2007 to buy its pandemic vaccine -- as soon as phase 6 was declared. This agreement could explain why Professor Roy Anderson, one key scientific advisor to the British government, declared the swine flu a pandemic on May 1. What he neglected to say was that GSK was paying him an annual salary of more than €130,000 ($177,000).

In mid-June, 2009, the head of GSK's German division urged Health Minister Ulla Schmidt "to confirm the delivery stipulated under the contract as soon as possible." He also asked the health minister of the eastern state of Thuringia to "promptly provide us with binding confirmation of the contractually stipulated orders of the German states." Similar letters were sent to other German states.

July 4, 2009: *It's revealed that Rupert Grint has contracted swine flu. "At first I thought I was going to die," says the actor, who portrays the character Ron Weasley in the "Harry Potter" films, "but then I just got a sore throat."*

July 14, 2009: *In Germany, 727 people are officially infected, but no deaths have been reported.*

August 2009: *The Australian flu season has ended. In the absence of a vaccine, only 190 people have died by the end of the season -- a significantly smaller number than in a normal flu season.*

August 29, 2009: *A SPIEGEL survey shows that only 13 percent of Germans want to be vaccinated.*

Sept. 7, 2009, Offices of the State of Thuringia, Berlin

A special summit on Berlin's Mohrenstrasse. The state health ministers arrived, one after another. The purpose of the meeting was to decide whether more vaccine should be ordered. Everyone knew it was election season in Berlin, and Ulla Schmidt had made it abundantly clear that "everyone who wants to be vaccinated can be vaccinated. I expect that the states will live up to their responsibility." The minister was extremely careful not to create the impression that she was depriving the population of anything.

It was a warm, late summer afternoon, but the mood at the meeting was icy. "Ahead of the crisis, the federal government placed us under massive pressure to order more vaccine," says Dietrich Wersich, a member of the conservative Christian Democratic Union (CDU) and Hamburg's health senator. "But it was clear to all of us that there was very little willingness within the population to get vaccinated."

Meanwhile, a debate had erupted over whether Germany had chosen the wrong vaccine, Pandemrix. It contained a new type of agent designed to boost its effectiveness, known as an adjuvant, which had never undergone large-scale human trials in connection with the swine flu antigen. Were millions of people about to receive a vaccine that had hardly been tested? "This is a large-scale experiment on the German people!" warned Wolfgang Becker-Brüser, publisher of the medical journal *Arznei-Telegramm*.

In theory, says former PEI President Löwer, it would have been possible to approve an adjuvant-free swine flu vaccine in Germany. But the contracts for Pandemrix had been signed in 2007, and they came into effect automatically when the WHO decided to declare phase 6. Germany was in a bind.

The disgruntled state health ministers pointed out that the 50 million vaccine doses that been ordered had already cost the states half a billion euros. Was it truly necessary to order more, they asked?

The ministers felt pressured from all sides. On the one hand, the media were stoking fears of the virus. The German tabloid newspaper *Bild*, in particular, was printing new tales of horror almost daily. On the other hand, the pharmaceutical companies were upping the pressure and constantly setting new ultimatums.

'Miserable Advice' from the Health Institutes

The ministers attending the meeting in Berlin still remembered all too clearly how drug maker Roche had urged the German states to buy the flu medication Tamiflu. On April 30, at 3:28 p.m., the ministers had received an email from the Thuringia health ministry, under the subject line "Urgent: Roche offer." It read, "Roche has just informed us that it still has an inventory of 180,000 packages of Tamiflu. They are making this inventory available to the states until 4:30 p.m. today. Otherwise the inventory will be used to service other inquiries from wholesalers, etc." In fact, however, there had been no reports of any serious supply bottlenecks at any time.

The infectious disease experts at the Robert Koch Institute (RKI) and PEI were also applying pressure to the state health ministers. "We felt that we were getting miserable advice at the time," says Social Democrat Hermann Schulte-Sasse, a member of the Bremen State Council. "The institutes were no help to us in terms of preventing scaremongering."

Instead, the RKI and PEI were coming up with new alarming numbers. In June, the experts warned that Germany could expect up to 80,000 deaths, and "€15 billion to €45 billion in lost production."

One of the health ministers at the Berlin meeting was outraged that the researchers had not told them about new studies that suggested a single vaccination appeared to be sufficient for the swine flu. If it was true, the states stood to save a lot of money, because the 50 million doses they had already ordered would be enough for 50 million people, not a mere 25 million people as described in the original plan. Ordering more vaccine would be unnecessary.

All eyes were on RKI President Jörg Hacker. "The random samples have been too small up to now," he said, seeking to downplay the issue. It was a situation for which Hacker – a scientist, not a politician – was poorly prepared.

If a single dose was sufficient, it meant not only that the states could manage with a lot less vaccine; it was also a strong indication that the population was by no means at the mercy of the virus. The dangers of swine flu, in other words, may have been far smaller than previously thought.

But the all-clear signal didn't reach anyone in the room. The ministers reluctantly agreed to keep an option to buy 18 million more doses of vaccine from yet another pharmaceutical company, Novartis.

Oct. 9, 2009: Wolf-Dieter Ludwig, an oncologist and chairman of the Drug Commission of the German Medical Association , says: "The health authorities have fallen for a campaign by the pharmaceutical companies, which were plainly using a supposed threat to make money."

Oct. 21, 2009: *A BILD newspaper headline, printed in toxic yellow, warns: "Swine Flu Professor Fears 35,000 Dead in Germany !" The professor's name is Adolf Windorfer, and when pressed, he admits that he has received payments from the industry, including GSK and Novartis. Next to the BILD headline is an ad for the German Association of Pharmaceutical Companies.*

Nov. 28, 2009: *The swine flu begins to subside in Germany . Hardly anyone wants to be vaccinated.*

Dec. 8, 2009: *English road crews run out of grit to treat the country's icy roads. Paul Flynn, a Labour MP in the British Parliament, proposes using the government's unused Tamiflu pills instead. A study by the Cochrane Collaboration has shown that the flu medication was relatively ineffective.*

Jan. 7, 2010: *RKI President Hacker, warning of a new wave of the flu, says: "The vaccine is still needed because the virus is still here."*

Jan. 26, 2010: *Wolfgang Wodarg, a member of the German parliament, tells the European Council in Strasbourg that "millions of people worldwide were vaccinated for no good reason." According to Wodarg, the WHO's classification of the swine flu as a pandemic have earned the pharmaceutical companies $18 billion in additional revenues. Annual sales of Tamiflu alone have jumped 435 percent, to €2.2 billion.*

March 5, 2010: *German states propose selling 10 million doses of surplus doses of the swine flu vaccine Pandemrix to Pakistan .*

Early March 2010, WHO Headquarters

The SHOC room is now being used for other emergencies, including the coordination of aid for earthquake victims in Haiti. But often the room is empty.

The mood at the WHO has grown less tense. The press office is no longer staffed around the clock. The tent set up for journalists in the employee parking lot is gone. IT specialist Jered Markoff no longer receives phone calls in the middle of the night. And influenza expert Keiji Fukuda is happy to spend time on his hobby – playing cello – once again.

What was this pandemic? Was it all just "good practice for an emergency," as WHO advisor and industry lobbyist Osterhaus puts it? Did the authorities do everything right, as Australian epidemiologist John Mackenzie insists?

Certainly not. No one at the WHO, RKI or PEI should feel proud of themselves. These organizations have gambled away precious confidence. When the next pandemic arrives, who will believe their assessments?

Perhaps they should have followed the example of Ewa Kopacz, the Polish health minister. The 53-year-old physician, a member of the free-market Civic Platform, has a reputation for courting controversy.

When she stepped up to the podium in the Polish parliament, the Sejm, during its vaccine debate, she wore a bright-red dress -- her combat gear. "As a doctor, my first obligation is to harm no one," she said. For this reason, she added, Poland was not going to follow in the rest of Europe's footsteps. "We will not purchase any vaccine against the swine flu," Kopacz told the Sejm.

Politicians grumbled, but the health minister stood her ground. "Is it my duty to sign agreements that are in the interest of Poles, or in the interest of the pharmaceutical companies?" she asked.

Today, Europe can admire her steadfastness. About 170 people died of the swine flu in Poland, a much lower number than the annual death toll attributable to the seasonal flu.

A 1.3-meter (4'3") bronze statue weighing 70 kilograms now stands on the village square in La Gloria, in the mountains of Mexico – a likeness of Edgar Hernandez, the miracle boy who first defeated the swine flu.

THE FLU CASE

Der Spiegel's reconstruction of the false pandemic: Goebbels propaganda from the controlled media?

The Flu Case, 16 March 2010, 10:32
https://web.archive.org/web/20100525024749/http://www.theflucase.com/index.php?option=com_content&view=article&id=3032%3Ader-spiegels-reconstruction-of-the-false-pandemic-goebbels-propaganda-from-the-controlled-media-&catid=1%3Alatest-news&Itemid=64&lang=en

Weeks after investigations into the false swine flu pandemic have been announced by the Council of Europe Parliamentary Assembly and the French parliament, Germany's magazine Der Spiegel finally gets around to printing a report on the scandal.

Der Spiegel assigns eight reporters to write an article called "Reconstruction of a Mass Hysteria:The Swine Flu Panic of 2009" published online on March 12, which uses facts, evidence and documents that have been in the public domain for almost a year.

Clearly enjoying excellent contacts with WHO – a key actor in the false pandemic – , Der Spiegel is able to embellish its long overdue account with quotes from WHO pandemic flu chief Dr Keiji Fukuda that give his side of the story.
=> http://www.spiegel.de/international/world/0,1518,682613,00.html

Der Spiegel "reconstruction" asks why world overreacted to a non-existant virus threat.

But Der Spiegel ignores the fact that it promoted the mythical pandemic - and continued to do so for months after it was clear from the facts, documents and evidence that there was no lethal pandemic.

That said, Markus Grill made an inuathentic apology for Der Spiegel's lies in another report last week in German.

In addition, Der Spiegel reconstruction makes no mention of the risks associated with the pandemic vaccine or the lack of pharmacovigilance.

Given Der Spiegel's role in fabricating this pandemic, the report by the Goebbels propaganda team of eight is too little, too late.

International Swine Flu Conference

Conference: **March 10-11, 2010** Workshop: **March 12, 2010**

International Swine Flu Conference UK

10-11 March 2010, Workshop: 12 March 2010
https://web.archive.org/web/20091031184102/http://www.new-fields.com/ISFC_UK/
https://web.archive.org/web/20091031184102/http://www.new-fields.com/ISFC_UK/brochure.pdf

Top leaders and key decision-makers of major companies representing a broad range of industries will meet with distinguished scientists, public health officials, law enforcers, first responders, and other experts to discuss pandemic prevention, preparedness, response and recovery at the 1st International Swine Flu Conference.

At the International Swine Flu Conference, attendees will be able to draw on first-hand best practices to create the solid business continuity plans that their companies and organizations need in order to prepare for, respond to, and survive a pandemic.

The International Swine Flu Conference draws on the success of the seven previous Bird Flu summits which featured as speakers several distinguished personalities such as Dr. **David Nabarro**, the United Nations Coordinator for Avian and Human Influenza, **Alex Thiermann** of the World Organization for Animal Health (OIE) and Dr. **Wenqing Zhang** of the WHO Epidemic and Pandemic Alert and Response.

Well-known emergency responders, heads of hospitals from around the world, and hog/swine industry leaders will speak in this summit.

Each day of the conference will offer papers on a wide range of topics including:
- Preparing Community Strategies
- Local Partnership and Participation
- Delivery of Vaccine and Antiviral Medication
- Emergency Response and Hospital/Healthcare Coordination
- Prevention Education Efforts and Risk Communication
- Command, Control and Management
- Business Community’s Role

Panel Discussions include:
- Clinical Picture: Country Report & Situation Update
- Clinical Picture: Impact of US Export Regulations on International Cooperation in the H1N1 Pandemic Flu Response
- Risk Communication, Prevention Education Efforts and Risk Communication
- Understanding the Connection Between Human and Animal Disease, Exploring One World, One Health
- Vaccines delivery

Over 20 breakout sessions will be offered addressing a wide range of issues, including:
Breakout: Agricultural Perspective: Socio-Economic Impact on Swine Industry
Breakout: Schools/University Planning: How and When to Close Schools

Next International H1N1 Swine Flu Conference planned on 18-19 August 2010
=> 2nd International Swine Flu Conference. – Washington, DC, 18-19 August 2010.

1A KRANKENVERSICHERUNG
clever vergleichen und sparen

Schweinegrippe offenbar maßlos überschätzt

1A krankenversicherung, 12 März 2010, 10:45 Uhr
https://web.archive.org/web/20100314205605/http://www.1a-krankenversicherung.org/nachrichten/20100312/7486/schweinegrippe-offenbar-masslos-ueberschaetzt/

Die Schweinegrippe ist in Deutschland stark abgeflaut. Lediglich 43 neue Fälle wurden in der vergangenen Woche gemeldet. Viel weniger Menschen als erwartet haben sich in Deutschland gegen die Schweinegrippe impfen lassen. Die Bundesländer bleiben auf Millionen Dosen des Impfstoffs Pandemrix sitzen.

Es ist ruhig geworden um die Schweinegrippe. Noch im November letzten Jahres hatten sich bis zu 45.000 Menschen in einer Woche mit dem Virus der neuen Grippe angesteckt. Insgesamt wurden seit Frühjahr 2009 225.921 Fälle der Schweinegrippe an das Robert-Koch-Institut gemeldet. 243 davon verliefen tödlich. Die Sterblichkeit liegt damit deutlich unter der der saisonalen Grippe, obwohl für letztere kaum genaue Zahlen vorliegen. Schätzungen gehen aber von mehreren tausend Todesfällen in jeder Grippesaison aus. Dass das A/H1N1-Virus längst nicht so verheerend gewütet hat wie ursprünglich befürchtet, veranlasst Experten nun dazu, Pandemiepläne in der jetzigen Form in Frage zu stellen.

Neue Welle ab Herbst?

Das Robert-Koch-Institut hat bisher aber keine Entwarnung gegeben. Die Virologen weisen darauf hin, dass die weitere Entwicklung der Grippeaktivität nicht vorhersehbar sei. Denkbar ist eine weitere Welle, die ab Herbst über Deutschland rollen könnte. Typisch für die Verbreitung der Influenza sei nach Erfahrung der Biologen eine Ausbreitung in Wellen. Allerdings sprach der Mikrobiologe Alexander Kekulé gegenüber dpa davon, dass die Viren voraussichtlich nicht gefährlicher werden dürften.

Kekulé forderte, den Pandemieplan der WHO anzupassen. Die Erfahrungen hätten gezeigt, dass zwischen gefährlichen und ungefährlichen Erregern unterschieden werden müsse. Bei der Schweinegrippe ist trotz relativ geringer Gefahr, die vom Virus ausgeht, die höchste Pandemiestufe durch die Weltgesundheitsorganisation WHO ausgerufen worden. Dabei war allein die Geschwindigkeit, mit der sich das Virus auf dem Globus verbreitete, ausschlaggebend.

Mangelnde Impfbereitschaft

Während die Gesundheitsexperten der WHO die Gefahr der Schweinegrippe offenbar überschätzten, hat die Bevölkerung scheinbar den richtigen Instinkt gehabt. Deutlich weniger Menschen als erwartet ließen sich impfen. Genaue Zahlen gibt es zwar nicht, doch Schätzungen gehen von einer Quote von vier bis zehn Prozent der Bevölkerung aus. Allerdings hatten die Bundesländer 50 Millionen Dosen des Impfstoffs Pandemrix bestellt. Das sollte für rund 30 Prozent der Bevölkerung reichen.

Doch diese Kalkulation ging noch davon aus, dass zwei Impfungen nötig seien, um einen wirksamen Schutz herzustellen. Es stellte sich aber im Verlauf der Impfkampagne heraus, dass eine Dosis ausreicht, so dass deutlich weniger Impfstoff verbraucht wurde als geplant. Von den 50

Millionen bestellten Dosen müssen die Länder zwar nur noch 34 Millionen abnehmen. Dennoch wurden lediglich acht Millionen Impfeinheiten verbraucht.

Impfstoff ins Ausland

Teile des überschüssigen Impfstoffs gegen die Schweinegrippe sollen daher verkauft werden. Es gibt mehrere Interessenten, darunter Pakistan. Das niedersächsische Gesundheitsministerium leitet die Verhandlungen, gab jedoch bisher keine Details zum Verkauf bekannt. Seit einigen Wochen planen die Bundesländer, überschüssigen Impfstoff ins Ausland zu verkaufen. Solange die höchste Pandemiestufe der WHO nicht aufgehoben wird, muss außerdem eine bestimmte Menge des Impfstoffs bevorratet werden.

THE FLU CASE

Germany reported only 43 new cases of swine flu last week: is pandemic emergency state justified?

The Flu case, 12 March 2010, 12:36

https://web.archive.org/web/20100325184950/http://www.theflucase.com/index.php?option=com_content&view=article&id=3000%3Agermany-reported-only-43-new-cases-of-swine-flu-last-week-is-pandemic-emergency-state-justified&catid=1%3Alatest-news&Itemid=64&lang=en

There were only 43 new cases of the mild swine flu reported in Germany last week, prompting criticism of the decision by governments and WHO to retain the pandemic emergency level 6 declaration, report local media.

According to Germany's Robert Koch Institute, 225,921 people in the country have fallen sick with the swine flu since spring 2009 and a total of 243 people died, far fewer than from the regular seasonal flu.

РИА НОВОСТИ

Геннадий Онищенко:

Продажу всего спиртного в РФ нужно запретить с 21 часа

РИА, Новости, 14 марта 2010, 16:11
https://ria.ru/20100314/214204464.html

- Ваш прогноз на весну-лето по ситуации с гриппом? Есть ли риск возвращения уже подзабытого «птичьего» гриппа (H5N1) с началом весеннего перелета птиц?

- Мы о нем не забыли. У нас ведется мониторинг за этим гриппом, а также за так называемым свиным гриппом. Первая волна H1N1 прошла. На эту неделю уровень циркуляции этого гриппа в общем объеме невысокий. Мы регистрируем превалирование сезонного гриппа типа B.

Осенью текущего года прививаться будем трехкомпонентной вакциной против гриппа, куда войдут штаммы A/H1N1 (California 07/2009), A/H3N2 (Perth 16/2009) и B (Brisbane 60/2008). То есть, будут заменены два штамма, один из них актуальный сейчас - свиной.

Этот грипп оправдал наши надежды, к счастью. Хотя он и успел распространиться по всему миру, но не приобрел агрессивных качеств, и это хорошо.

- То есть, свиной грипп оказался не так страшен, как «малевали». Всемирная организация здравоохранения поспешила, объявляя пандемию? Можно ли говорить о некоей ангажированности этой структуры фармкомпаниями?

- ВОЗ совершенно правильно объявила пандемию. Они собрали экспертов со всего мира и приняли решение. Новый штамм появился – да, захватил всю планету – да. И, слава Богу, что он оказался не таким страшным.

В чем были издержки? С самого начала ВОЗ стала говорить о том, что эффективен конкретный препарат, а остальные – не эффективны. На самом деле, это не так. И такое поведение вызывает вопросы. Это делали уже действительно отдельные чиновники, и здесь было нарушение корпоративной этики, и даже устава ВОЗ.

- В России была создана собственная вакцина для защиты от свиного гриппа. Не зря потратили 4 миллиарда рублей?

- Конечно, не зря. Во-первых, мы организовали свое производство. Мы показали, что мы в этом плане защищены. Ведь, в принципе, это была организованная природой биологическая атака на здоровье россиян. Причем потери от гриппа, они самые большие всегда, учитывая, что обычно болеет огромное число людей. Поэтому это нужно, вакцинация продолжается, а к следующему сезону это будет уже не моновакцина, а трехкомпонентная вакцина, которую надо будет создавать.

LE PROGRES.fr

Olivier Saison

A Lyon on essaie de croiser les virus H1N1 et H5N1de la grippe

Le Progres, 18 March 2010
https://web.archive.org/web/20100501090431/http://www.leprogres.fr/fr/france-monde/article/2859863,192/A-Lyon-on-essaie-de-croiser-les-virus-H1N1-et-H5N1de-la-grippe.html

Depuis trois semaines, le P4 de Lyon a interrompu toutes ses autres manipulations. Ce laboratoire de sécurité maximale - il n'en existe qu'un en France et une vingtaine dans le monde - se concentre actuellement sur une expérience à haut risque : des tentatives de croisement entre le nouveau virus H1N1 et celui de la grippe aviaire, le H5N1. Le premier se propage beaucoup et tue peu, le second se propage peu et tue beaucoup. Une hybridation des deux serait calamiteuse.

«On essaie de comprendre, en infectant une cellule avec ces deux virus, quels sont les déterminants génétiques qui leur permettraient d'échanger leurs gènes (notamment chez le cochon NDLR)» résume le virologue Bruno Lina, qui dirige les travaux sur la grippe A pour ce laboratoire Inserm. Trois biologistes de son équipe ont été détachés pour effectuer ces tests décidés et avalisés au niveau ministériel. Pourvus de passeports spécifiques, ils sont assistés par une demi-douzaine de techniciens attachés au site. « Toutes les manipulations se font en scaphandre et obéissent à des règlements très contraignants » assure Bruno Lina.

Si l'expérience est bien liée au Centre national de référence des virus de la grippe, que ce dernier dirige, sa finalité ne serait, selon lui, pas d'aboutir à un vaccin, mais juste « cognitive » : « Pourquoi fabriquer un vaccin contre un virus qui n'existe pas ? » Ou pas encore. Les premiers résultats ne tomberont avant deux mois et décideront de la suite à donner à cette opération au budget (provisoire) de 200 000 euros. Pour l'heure, « on a fait quelques essais, mais on n'a obtenu que des résultats très préliminaires » poursuit le virologue. S'il est trop tôt pour en déduire quoi que ce soit quant à la probabilité de l'apparition d'un tel monstre viral, « aujourd'hui, le risque semble faible » confie-t-il. Et de conclure: «C'est une bonne nouvelle».

Si les médias semblent pour l'instant en avoir fini avec la grippe A, ce n'est sans doute pas le cas de nos organismes. «C'est une certitude, iI y aura bien une nouvelle vague épidémique» estime Bruno Lina, directeur du Centre national de référence des virus de la grippe.

«Soit le virus H1N1 se transforme en virus saisonnier et cette épidémie aura alors un impact modéré, soit il déclenche une deuxième vague l'hiver prochain» poursuit-il.

Deuxième vague qui pourrait avoir un impact plus important, comme cela avait été le cas lors des épidémies grippales des hivers de 1957 (H2N2) et 1968 (H3N2): «C'est lors des deuxièmes vagues, en hiver 58 et en hiver 69, qu'il y avait eu le plus de décès» rappelle le virologue. Même « si rien n'est logique avec cette grippe, il faut quand même garder ça en tête».

Sans être alarmiste, le chercheur garde aussi un œil sur le virus aviaire H5N1 (287 décès sur 486 cas dans le monde) qui, constate-t-il, «semble un peu reprendre du poil de la bête». Comme en témoignent les cinq nouveaux cas répertoriés en Egypte.

O.S. - Les filovirus Ebola et Marburg - Les arénavirus de type 4 : le virus Lassa d'origine africaine et les arénavirus d'origine sud américaine. - Le virus de la fièvre hémorragique de Congo Crimée - Le virus de la variole - Les Henipavirus Nipah et Hendra - Les virus Influenza A H5N1 d'origine

THE FLU CASE

Grippe H1N1:
Bachelot le 23 mars devant la commission d'enquête du Sénat

The Flu Case, 18 March 2010, 12:20
https://web.archive.org/web/20100525025321/http://www.theflucase.com/index.php?option=com_content&view=article&id=3052%3Afrench-health-minster-to-give-evidence-on-false-swine-flu-pandemic-before-senate-next-week&catid=41%3Ahighlighted-news&Itemid=105&lang=en

(AFP) – Il y a 1 jour

Paris – La commission d'enquête du Sénat sur le rôle des firmes pharmaceutiques dans la gestion par le gouvernement de la grippe A (H1N1) auditionnera le 23 mars la ministre de la Santé Roselyne Bachelot, a annoncé le Sénat mardi.

Cette audition, qui se déroulera Ã 17H00 salle Clémenceau, sera ouverte Ã la presse.

Cette commission a été créée Ã l'initiative du groupe CRC-SPG (24 sénateurs) qui a fait valoir son "droit de tirage" (tout groupe parlementaire peut demander une fois par session la création d'une commission d'enquête).

Evoquant "une surévaluation des risques", une "dramatisation", François Autain (Parti de Gauche), en présentant fin janvier Ã la presse la demande de son groupe, avait estimé nécessaire d'enquêter sur "le rôle des experts", déplorant que ceux "qui conseillent les laboratoires sont souvent ceux qui conseillent les gouvernements".

"Notre commission portera essentiellement sur ces liens incestueux qui expliquent la situation dans laquelle nous sommes", avait-il précisé.

"La France a le plus grand écart entre le taux de vaccinés, 5,5 millions de personnes – 7% de la population – et les doses commandées, 94 millions de doses vaccinales", avait-il dénoncé.

François Autain préside la commission et le poste clef de rapporteur est occupé par Alain Milon (UMP).

French health minster to give evidence
on false swine flu pandemic before Senate next week

The Flu Case, 18 March 2010, 12:20

The French Health Minister Roselyne Bachelot is scheduled to give evidence on the mass swine flu vaccination campaign before a Senate inquiry on March 23rd, according to AFP.

Francois Autain, the head of the commission, said the inquiry would focus "essentially on the incestuous links" between pharmaceutical companies and government, saying these links "explain the situation in which we are".

5.5 million people in France, or 7% of the population, were given the swine flu jab after an unprecedented campaign by the government and media.

At the end of August 2009, plans by Bachelot to vaccinate the entire French population in special swine flu vaccine centres were leaked.

Plans to suspend civil rights under the pretext of fighting a pandemic were also leaked.

Autain said that the risks of the swine flu vorus had been "overestimated" and the subject of a "dramatisation".

He said the role of "experts" needed to be investigated, noting that the same experts that advised the government also advised the pharmaceutical companies.

Both chambers of the French parliament -- the Senate and the National Assembly -- have announced inquiries into the mass vaccination campaign with the untested swine flu jab.

Should we be worried about the next pandemic wave?
Yes, argues French blog Panier des Crabes
Translated by Carolyn Dunning

Destination Sant, 22 March 2010 // The Flu Case, 26 March 2010 13:53
https://web.archive.org/web/20100401142117/http://www.theflucase.com/index.php?option=com_content&view=article&id=3156%3Ashould-we-be-worry-about-the-next-pandemic-waves-yes-argues-french-blog-panier-des-crabes&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Several pieces of information indicate that an attempt is being made to start a second, more lethal pandemic:

A) Firstly, the Swiss pharmaceutical group Novartis:

On 26/01/2010, Novartis warned governments not to cancel contracts for H1N1 vaccines.

On Tuesday, the Swiss pharmaceutical group Novartis, which produces a vaccine against H1N1 pandemic influenza, warned governments against the cancellation of orders, warning that in the future "reliable" states would be served first. The boss of the pharmaceutical giant warned that "the next time there was a pandemic - and there will be an pandemic" - governments that had been reliable partners would be treated preferentially.

Of course when the boss of Novartis said

- "the next time there is a pandemic - and there will be a pandemic,"

it can be argued that since time immemorial there have been pandemics but all the same .. . it sounds like a threat!

B) Secondly: 23/02/2010 The medical newspaper "Le Quotidien du Médecin", stated:

The WHO, which gives vaccine recommendations twice a year for the northern hemisphere and the southern hemisphere, has already expressed a recommendation in September for the southern countries.

The seasonal vaccine for the 2010-2011 northern hemisphere can therefore be expected to contain three strains of virus: H1N1 A-California/7/2009, H3N2 A / Perth/16/2009 and B/Brisbane/60/2008.

Indeed, these other influenza viruses have been circulating this winter across the world and should "continue to coexist in 2010-2011 in the northern hemisphere with a probability that the pandemic virus of 2009 will dominate," said the UN agency.

However, the seasonal H1N1 strain has circulated very little this winter.

"It is unlikely that seasonal influenza A (H1N1) viruses will circulate next winter in the northern hemisphere," says the WHO.

Therefore, WHO recommends not to include the seasonal H1N1 strain (which was the 'A/Brisbane/59/2007 in 2009-2010 such as the vaccine: Vaxigrip) in the vaccine 2010-2011.

Anyway those who refused the vaccination against influenza A but who were vaccinated for seasonal influenza will receive for the year 2010-2011 the A-California/7/2009 H1N1 (influenza A) which was rejected by so many people.

A reminder: The new virus, A / California / 7 / 2009, has been described as a recombination of multiple origins of the H1N1 strain.

It contains genetic sequences:
- from North American swine flu,
- from North American bird flu,
- from human flu,
- from eurasian swine flu.

To clarify:
In 2010-2011, you will receive an injection: A/California/7/2009 + H3N2 A/Perth/16/2009 and / Brisbane/60/2008.

Strain: A/California/7/2009 consists of
- Seasonal flu: very contagious and deadly
- Swine flu (H1N1): highly contagious but not deadly
- Bird flu: not contagious but extremely lethal in 60% of cases.

C) Thirdly: on 18/03/2010 in another surprising article by lyoncapitale:

A viral monster tested in Lyon
The P4 maximum security laboratory, has made the first page headline in this morning's newspaper “Progrès”.

At issue: the experiments undertaken by virologists who have worked for three weeks on crossing H1N1 (swine flu) and the H5N1 (bird flu) viruses. The first is highly contagious but not deadly, while the second is often fatal but spreads little. The experiment was especially designed to anticipate a possible mutation of the two viruses but not (yet) to create a vaccine. The virologist Bruno Lina, interviewed by the newspaper, said however that the probability of the existence of such viruses are fairly low.

Ok! Here, there is a problem ... Flashback to 13.03.2009: See note: Swine Influenza A (swine flu) coincidence or not?

The company Baxter had confirmed that it had manufactured a product contaminated with the bird flu virus H5N1.

The contaminated product, a mixture of human flu H3N2 virus and H5N1 bird flu virus which were not correctly identified ....

Biosafety specialists expressed fears the human influenza H3N2 virus had been mixed with bird influenza H5N1 virus.

This is a dangerous practice that should be prohibited, according to several experts.

An accidental spread of the mixture of H5N1 and H3N2 viruses could have led to disastrous consequences.

The H5N1 virus does not easily infect humans, but H3N2 does.

Again according to experts, in the event that a person exposed to the mixture was simultaneously infected by both strains, that person could serve as an incubator to a hybrid virus capable of spreading easily from one human to another.

This mixture of reassorted strains is one of two ways to create a pandemic virus.

And, strangely less than a month afterwards, we were alerted about a pandemic influenza A, obliging member states of WHO to buy vaccines.

So in 2009-2010, the cross between the H1N1 (swine flu) virus and the H5N1 (bird flu) virus was already tested in real life situation on those who agreed to be vaccinated against influenza A with strain: A/California/7/2009.

Let us not forget that it was a mixture of:
- Seasonal Influenza (H3N2): highly contagious and deadly
- Swine flu (H1N1): highly contagious but not deadly
- Bird flu (H5N1): very contagious but extremely lethal in 60% of cases.

As we understand from the WHO, the experiment will continue next year with the injection of the 2010-2011 flu vaccine still containing the A/California/7/2009 strain.

Given the concern about the mixture of the H3N2 virus and the bird flu H5N1 virus manufactured by the Baxter Group, specialists in biosafety were alarmed about people who would be simultaneously infected by both strains. Their fears revolved around the fact that they could serve as an incubator for a hybrid virus.

The research carried out by the security laboratory experimenting over the last three weeks a crossing of H1N1 (swine flu) and H5N1 (bird influenza) viruses is understandable, and according to them the purpose is to anticipate a possible mutation of the two viruses.

Questions:

Should we worry about a second pandemic?
Will people vaccinated in 2009-2010 be incubators for a hybrid virus capable of spreading easily from one human to another in 2010-2011?
And if not this winter, when? 2011?

Personally, I think if this were to happen, it would be for winter 2012!
Trying to cross H1N1 and H5N1 influenza viruses

on 18/03/2010 04h00
In the P4, a maximum security laboratory, an experiment in progress attempts to determine the conditions for hybridization of the two viruses. The first spreads fast but kills few, the second is not contagious but often fatal.

Over the last three weeks, the P4 in Lyon has stopped all other experiments. This maximum security laboratory - there is only in France and twenty in the world - is currently focusing on high-risk experiments: attempts to produce a cross between the new H1N1 virus and bird flu, the H5N1 virus. The first spreads far and kills few; the second spreads not much and kills many. Creating a hybrid of the two would be disastrous.

"We are trying to understand, by infecting a cell with these two viruses, which are the genetic determinants that would allow them to exchange genes (especially in pigs – Editor's note)" says virologist Bruno Lina, who heads the influenza A project for this Inserm laboratory. Three biologists from his team have been assigned to perform these tests which were determined and endorsed at ministerial level. Provided with specia ID, they are assisted by a half-dozen technicians attached to the site. "All operations are carried out in airtight safety suits (scaphandre) and are subject to very restrictive regulations" declares Lina.

If the experiment is linked to the National Reference Center for influenza virus, which Lina directs, its purpose would not, in his opinion, lead to a vaccine, but would just be "for knowledge purposes": "Why make a vaccine against a virus that does not exist? Or does not yet exist. The first results will not be before two months and will decide the action following the operation, the (provisional) budget of which is 200 000 euros. For now, "we have carried out some experiments, but obtained only very preliminary results," adds the virologist. If it is too early to deduce anything about the likelihood of the emergence of such a viral monster, "today, the risk seems low," he says. He concluded: "That is good news." // *Olivier Saison*

H1N1: Meanwhile, before the second wave

If the media appears to have finished with swine flu story, this is probably not true of our bodies. "*It is a certain there will be a new pandemic wave*," says Bruno Lina, head of the National Reference Center for influenza viruses. "Either the H1N1 virus will become a seasonal virus and the pandemic will have a moderate impact, or it will trigger a second wave next winter," he adds.

A second wave that could have a greater impact, as was the case during the winter influenza epidemics of 1957 (H2N2) and 1968 (H3N2): "It was during the second wave, in winter 58 and winter 69 that there were the most deaths," the virologist reminds us.

Even "if nothing is logical with this flu, we must still keep this in mind." Without being alarmist, the researcher is also keeping an eye on the bird H5N1 virus (287 deaths out of 486 cases in the world), which he says, "seems to be on the revival." As evidenced by five new cases reported in Egypt.

OS - The filoviruses Ebola and Marburg - Arenavirus of type 4: Lassa virus of African origin and arenaviruses from South America. – The haemorrhagic fever virus from the Crimean Congo - The smallpox virus - The Nipah and Hendra Henipaviruses – Influenza A viruses of H5N1 origin.

Зачем придумали «свиной» грипп

BFM.ru, 22 марта 2010, 08:36
https://www.bfm.ru/news/49100

«Свиной» грипп держал в напряжении весь мир на протяжении почти года. Масштабная компания по вакцинации была предпринята, чтобы остановить возможную пандемию. Однако, как выяснилось позднее, H1N1 был всего лишь безобидным штаммом обычного гриппа.

«Свиной» грипп держал в напряжении весь мир на протяжении почти года. Масштабная компания по вакцинации была предпринята, чтобы остановить возможную пандемию. Однако, как выяснилось позднее, H1N1 был всего лишь безобидным штаммом обычного гриппа. Как и почему этот штамм вызвал мировую гиперреакцию? Хронику событий попыталось восстановить издание Spiegel.

Сейчас только в Германии 10 млн доз ненужных вакцин от некогда «смертельно опасного» вируса «свиного гриппа», который было «невозможно остановить». Власти пытаются продать их Пакистану. Пресс-центр Всемирной организации здравоохранения не работает больше круглые сутки. Эксперты организации тратят свободное время на себя и свое хобби – как главный эксперт ВОЗ по вопросам пандемического гриппа Кейджи Фукуда, который играет после работы на виолончели. Российские регионы, наконец, начали получать вакцины от свиного гриппа и удивляются отсутствию желающих привиться. «Что же это была за пандемия?» – задается вопросом издание.

Первый случай так называемого «свиного» гриппа был зафиксирован в апреле 2009 года в мексиканской деревне у пятилетнего ребенка, который потерял аппетит, страдал от высокой температуры и болей во всем теле. Жители деревни поспешили обвинить во всем свиней, так как давно были убеждены, что это проклятые животные. Мальчик выздоровел так же внезапно, как и заболел. Однако результаты его медицинских анализов сделали его знаменитым – врачи обнаружили новый вид вируса, а ребенок стал первой его официальной жертвой.

Течение болезни было мягким, как и подавляющее большинство из тех миллионов случаев заболевания, которые будут отмечаться последующие несколько месяцев. Новый вирус мог бы привлечь меньше внимания, если бы не современная медицина, генетический анализ и тесты на антитела. Свиной грипп завоевал бы мир, и ни один врач этого бы не заметил.

Однако на этот раз мир заметил вирус – преимущественно из-за высокотехнологичной медицины и индустрии вакцин. «Иногда тебе кажется, что вся промышленность только и ждет пандемии, – говорит врач Том Джефферсон. – И все это потому, что один из вирусов гриппа мутировал».

24 апреля 2009 года специалист Всемирной организации здравоохранения (ВОЗ) Кейджи Фукуда позвонил начальнику отдела Центра по контролю над заболеваниями Нэнси Кокс. Потенциальные последствия этого звонка были ясны: могла начаться разрушительная пандемия, в результате которой, по прогнозам ВТО, могло умереть от 2 до 7,4 млн людей – в лучшем случае.

Ситуация же оставалась неясной: сначала сообщалась о нескольких десятках летальных исходов в Мексике, однако потом официальная цифра упала до 7. Эпидемиологи попали в неопределенную ситуацию, когда пришлось отвечать на вопросы: как быстро распространяется вирус? Кто в группе риска? И, главное, насколько опасен новый грипп? Чтобы получить

наиболее точные оценки, глава ВОЗ Маргарет Чен созвала экстренный комитет из 15 экспертов разных стран мира.

Значит ли это, что мягкое течение пандемии с самого начала не считалось возможным? В любом случае, попытки принизить риски были нежелательны, а ВОЗ ясно дала понять, что предпочитает основываться на самом пессимистичной сценарии. «Мы предпочитаем переоценивать, а не недооценивать ситуацию», – заявил Фукуда.

Средства массовой информации также внесли свою лепту в разжигание массовой истерии, считает издание. Сам Spiegel, например, напомнил об атипичной пневмонии и посвятил первую полосу новому «мировому вирусу», наполнив статью опасениями по поводу мутации вируса.

Отдельная роль в этой истории принадлежит фармпромышленности: производители вакцин даже начали специальное финансирование ученых. Группу лоббистов возглавлял Альберт Остерхаус из Erasmus Medical Center в Роттердаме, который также стал одним из наиболее влиятельных советников ВОЗ по вакцинам от гриппа.

Далее события разворачивались с калейдоскопической быстротой:

- 27 апреля 2009 года. ВОЗ подняла уровень пандемической угрозы до 4.
- 28 апреля 2009 года. Первые семь случаев заболевания предположительно новым вирусом гриппа в Германии.
- 29 апреля 2009 года. ВОЗ подняла уровень пандемической угрозы до 5. «Гриппозные» исследователи ликовали. «Пандемия для вирусологов – это как солнечное затмение для астрономов», – заявил тогда Маркус Айкман, глава лаборатории в Германии.
- 30 апреля 2009 года. Египт начал убой всех домашних свиней в стране.
- 4 мая 2010 года. В Мексике было объявлено, что футбольные матчи пройдут без зрителей. В одной из земель Германии было запрещено приветствовать друг друга поцелуем.
- 10 июня 2009 года. ВОЗ получил данные о 141 смерти от свиного гриппа.
- 11 июня в штаб-квартире ВОЗ состоялось совещание, после которого глава организации объявил, что вирус непредсказуем и его не остановить. Была объявлена пандемия. Однако реальная ситуация на 11 июня мало соответствовала таким мрачным заявлениям. Критики уже начали насмешливо спрашивать у ВОЗ, не будет ли очередная вспышка простуды также объявлена пандемией.

«Фармотрасль не влияет ни на какое-либо наше решение», – заявлял Фукуда. Однако в середине мая, за три недели до объявления пандемии, 30 представителей фармкомпаний встретились с главой ВОЗ Маргарет Чен и генсеком ООН Пан Ги Муном. Официальным поводом было заявлено обсуждение того, как развивающиеся страны будут обеспечиваться новыми вакцинами. Однако на тот момент всю индустрию интересовал лишь один вопрос – когда уровень эпидемиологической угрозы вырастет до 6?

Шестой уровень угрозы был спусковым крючком, тем более, что к тому моменту многие контракты на вакцины были уже подписаны.

- 14 июля 2009 года. Только в Германии зафиксировано 727 случаев нового гриппа. Ни одной смерти в результате его.
- Август 2009 года. Сезон гриппа в Австралии закончился. При отсутствии вакцин к концу сезона умерло 190 человек, что ниже, чем от «обычного» гриппа.

Всю осень 2009 года правительства всех стран обсуждали, какие вакцины закупать, в каком количестве и закупать ли их вообще. Фармацевтические компании не успевали наращивать производство под предстоящие заказы вакцин и прогнозировали бурное развитие отрасли и рекордные прибыли. В 2009 году фармацевтическая промышленность мира могла заработать на продаже вакцин против вируса A/H1N1 более 7 млрд евро, по подсчетам инвестиционного банка JP Morgan. Однако спрос населения на прививки от свиного гриппа был крайне низок, а «недостаток» летальных исходов начал сводить массовую истерию на нет.

В январе 2010 года ВОЗ попыталась оживить общественный интерес к H1N1. 28 января на собрании экспертов ВОЗ Кейджи Фукуда высказал мнение, что возможна еще одна, третья, волна свиного гриппа, передавал Reuters. Число умерших от этого заболевания составило по всему миру около 14 тысяч человек. Это заявление ВОЗ не смогло подогреть панику, а некоторые страны даже начали отказываться от вакцинации. Так, Швеция попыталась отказаться от заказанных вакцин, так как невостребованными оказались около 7 млн доз из 18 млн, заказанных ранее.

В итоге, в феврале 2010 года Всемирная организация здравоохранения была вынуждена признать: «Пандемия гриппа H1N1, кажется, является менее опасной, чем другие вспышки гриппа, скажем, в 20 веке», – заявил главный эксперт ВОЗ по вопросам пандемического гриппа Кейджи Фукуда. На всякий случай ВОЗ призвала не терять бдительность и продолжать закупать противовирусные препараты.

На прошлой неделе Главный санитарный врач России Геннадий Онищенко заявил, что российское правительство не зря потратило 4 млрд рублей на создание вакцины против свиного гриппа. «В принципе, это была организованная природой биологическая атака на здоровье россиян», – передает «РИА Новости» слова главсанврача. – Этот грипп не оправдал наши надежды, к счастью. Хотя он и успел распространиться по всему миру, но не приобрел агрессивных качеств, и это хорошо».

franceinfo:

La ministre sera auditionnée sur la collusion présumée entre laboratoires pharmaceutiques et experts sanitaires

France Info, 23 March 2010

https://www.francetvinfo.fr/france/la-ministre-sera-auditionnee-sur-la-collusion-presumee-entre-laboratoires-pharmaceutiques-et-experts-sanitaires_239155.html

Cette commission d'enquête du Sénat sur "le rôle des firmes pharmaceutiques dans la gestion par le gouvernement de la grippe H1N1" a été mise en place à l'initiative des communistes et du Parti de gauche.François Autain, sénateur et médecin, a donné le ton des débats en dénonçant une "surévaluation des risques", voire une "dramatisation".

Cette commission d'enquête du Sénat sur "le rôle des firmes pharmaceutiques dans la gestion par le gouvernement de la grippe H1N1" a été mise en place à l'initiative des communistes et du Parti de gauche.

François Autain, sénateur et médecin, a donné le ton des débats en dénonçant une "surévaluation des risques", voire une "dramatisation".

"Plus on alarme, plus ça fait vendre"

Parlant de "liens incestueux", il a déploré que les experts qui travaillent avec les laboratoires soient "souvent ceux qui conseillent les gouvernements". On s'est affolé parce que "plus on alarme, plus ça fait vendre", a dénoncé le sénateur Autain.

L'audition devrait s'élargir à une critique générale de la gestion gouvernementale de la lutte contre la pandémie : contrats signés à la hâte sans clause de résiliation, commande de 94 millions de doses "inutilisées et inutilisables", mise à l'écart des généralistes pour ce qui n'était finalement "pas une véritable pandémie". Depuis, l'indépendance des experts est mise en doute vis-à-vis de laboratoires qui financent leurs recherches, leur offrent des postes de consultants et des participations à des congrès.

Lors d'une audition collective sur l'expertise organisée début mars à l'Assemblée nationale par le député PS Gérard Bapt, Jean Marimbert, directeur général de l'Afssaps (l'agence du médicament), les avait défendus en estimant qu'"il y a une stigmatisation injuste des experts, dans l'ensemble intègres" et qu'il était difficile de trouver des experts sans conflit d'intérêt dans des domaines "pointus".

Pour lui, il faut seulement être "intraitable" sur le respect des règles de déontologie. La loi, certes, impose aux experts de préciser les intérêts personnels qu'ils peuvent avoir dans une affaire du fait notamment de leurs liens avec les laboratoires. Mais les déclarations d'intérêts ne sont pas vérifiées, et il n'y a pas de sanction en cas d'omission.

Un travail est en cours sur une charte de la déontologie de l'expertise en santé publique, commune à toutes les agences sanitaires. André Cicolella, du Réseau environnement santé, a suggéré de créer une "Haute autorité de l'alerte et de l'expertise", qui ferait respecter les principes. "Sans gendarme, le code de la route est un chiffon de papier", a-t-il dit à l'Assemblée.

L'Etat déboursera 48 millions d'euros pour les vaccins annulés

L'Etat va débourser 48 millions d'euros, au lieu des 358 millions prévus initialement, pour les commandes de 50 millions de vaccins contre la grippe A H1N1 résiliés, indique Le Figaro mardi, sans citer ses sources. Le ministère n'a pas souhaité commenter l'information. Toutefois, la ministre de la Santé, devrait faire le point lors de son audition mardi après-midi au Sénat, indique-t-on.

Le laboratoire Novartis a signé l'accord de résiliation avec le ministère, mais les deux autres laboratoires (GSK et Sanofi) sont toujours en cours de négociation avec l'Etat français, a indiqué une source proche du dossier.

L'Etat avait commandé 94 millions de doses de vaccins contre la grippe aux laboratoires pharmaceutiques, à l'occasion de l'épidémie de la grippe, pour un montant d'environ 700 millions d'euros. Cependant, la grippe a été moins virulente que prévu et seulement 5,6 millions de personnes ont été vaccinées.

Le Monde

Roselyne Bachelot rejette les critiques sur sa gestion de la grippe A

Le Monde, 23 Mars 2010, à 21h19
https://www.lemonde.fr/planete/article/2010/03/23/roselyne-bachelot-rejette-les-critiques-sur-sa-gestion-de-la-grippe-a_1323578_3244.html

La ministre de la santé, Roselyne Bachelot, a défendu devant la commission d'enquête du Sénat sa gestion de la lutte contre la pandémie de grippe A.

Achat en masse de vaccins, indépendance des experts, information des médecins généralistes, négociations avec les laboratoires : la ministre de la santé, Roselyne Bachelot, a défendu au Sénat, mardi 23 mars, sa gestion de la lutte contre la pandémie de grippe A(H1N1).

La commission d'enquête sur *"le rôle des firmes pharmaceutiques dans la gestion par le gouvernement de la grippe H1N1"* avait été mise en place à l'initiative des communistes et du Parti de gauche. Elle est présidée par François Autain (Parti de gauche) et son rapporteur est Alain Milon (UMP). Pourquoi 94 millions de doses achetées ? Pourquoi des commandes fermes ? Les experts sont-ils vraiment impartiaux ? Pourquoi les médecins généralistes ont-ils été tenus à l'écart ? Autant de sujets abordés par les sénateurs, lors d'une audition au ton parfois âpre, qui a duré plus de deux heures et demie.

LIENS D'INTÉRÊT

M. Autain a insisté sur l'influence des laboratoires pharmaceutiques et sur les liens d'intérêt des experts. *"Ce n'est pas parce qu'un expert va travailler pour un laboratoire que son expertise n'est pas valable ou qu'elle est orientée*, a déclaré Mme Bachelot. *Les liens d'intérêt ne sont pas forcément des conflits d'intérêt.* (...)*Nous devons mobiliser les professionnels les plus compétents, et, dans un domaine donné, leur nombre est compté."* Elle a estimé aussi que les expertises étaient toujours rendues *"de facon collégiale et plurielle"* et que cela représentait *"une garantie"*.

La ministre a fait le point sur les négociations avec les laboratoires suite à l'annulation de commandes de vaccins. Confirmant les informations rapportées ce matin par *Le Figaro*, elle a redit qu'un contrat d'indemnisation avait été signé avec le seul laboratoire Novartis, d'un montant de 16 % du contrat initial, et que les négociations *"continuent"* avec les autres laboratoires, GSK et Sanofi-Pasteur. *"Si nous ne parvenons pas à une démarche transactionnelle, nous notifierons à ces laboratoires une indemnisation unilatérale sur les mêmes bases que le contrat Novartis, de 16 %"*, a dit la ministre. Rappelant que les acquisitions de 94 millions de doses avaient été *"dimensionnées de façon a pouvoir proposer la vaccination à l'ensemble de la population"*, elle a souligné que les laboratoires étaient *"en position de force"* et demandaient *"des commandes fermes"*.

Mme Bachelot a par ailleurs listé le nombre de fois où elle a rencontré les médecins généralistes, les pharmaciens et les infirmières, assurant qu'on ne *"pouvait pas dire qu'on ne les a pas écoutés"*.

THE FLU CASE

French Health Minister faces tough questions over swine flu vaccination campaign in Senate:
reports Le Monde

The Flu Case, 24 March 2010, 14:06
https://web.archive.org/web/20100601144135/http://www.theflucase.com/index.php?option=com_content&view=article&id=3136%3Afrench-health-minister-faces-tough-questions-over-swine-flu-vaccination-campaign-in-senate-reports-le-monde&catid=41%3Ahighlighted-news&Itemid=105&lang=en

French Health Minister Roselyne Bachelot was subjected to a grill that was much tougher than expected in France's parliamentary chamber, the Senate, yesterday over the role pharmaceutical companies played in the country's mass swine flu vaccination campaign.

Chaired by Francois Autain and Alain Milon, the Senate commission quizzed Bachelot for two and half hours on potential conflicts of interest, asking why the government had bought 94 million doses of swine flu vaccines : why contracts had been put under seal; whether government experts were really impartial; and why family doctors had been excluded from the mass vaccination campaign, reports Le Monde.

It emerged during the inquiry that Novartis has agreed to a 16% indemnity for surplus swine flu vaccine.

The government has, however, not been able to reach a deal with Glaxo Smith Kline or Sanofi, Batchelot revealed.

Only about 7 million people in France took the inadequately tested swine flu jab – for which pharmaceutical companies were given blanket immunity – leaving the government sitting on a stock of almost 90 million jabs.

H1N1 Swine Flu Cases Increasing in Southern Hemisphere

Voice of America, 29 March 2010

https://www.voanews.com/a/h1n1-swine-flu-cases-increasing-in-southern-hemisphere-89394817/114894.html

Nurse Kim Bigham gives Alfredo Ochoa a vaccination against the H1N1 or "swine flu," as his daughter Monserrat Ochoa and her cousin Esteban Ochoa, 3, watch at the Riverside Neighborhood Family Health Center in Riverside, California, 17 Feb 2010

A Senior World Health Organization Official confirms the H1N1 Flu pandemic appears to have peaked in North America and Europe. He says the center of increasing pandemic activity has shifted to Africa and other parts of the southern Hemisphere. Lisa Schlein reports for VOA from WHO headquarters in Geneva.

The World Health Organization (WHO) says more than 213 countries and territories have reported nearly 17,000 laboratory confirmed deaths from the H1N1 influenza pandemic. It says most of these deaths have occurred in the northern Hemisphere.

But now the pandemic is more active in the southern Hemisphere and more deaths are likely to occur in that part of the world.

WHO Special Adviser on Pandemic Influenza, Keiji Fukuda, says the H1N1 virus is circulating most actively in parts of Southeast Asia, West Africa, and in the tropical zone of the Americas.

Fukuda says the World Health Organization is concerned about what will happen as the southern Hemisphere enters its winter season.

"Many of the countries in the southern Hemisphere are the countries who are least able to handle large outbreaks of disease and who have the least resources," noted Dr. Fukuda. "As you know, the reports of H1N1 in some parts of Africa, particularly West Africa have been relatively recent. We did not have reports of activity in Western Africa in 2009. They really were more reported in 2010"

Dr. Fukuda says a main focus of WHO activity is to get H1N1 vaccines shipped to countries in the southern Hemisphere.

He says 25 out of 95 poor countries in need of the vaccines have received them. He notes another concern is the weak monitoring ability in developing countries.

"I think it is clear that surveillance capacities still can be made much better," Dr. Fukuda added. "They can be improved in Africa, but also in a number of countries. So, this is one of our big aims that we hope to continue moving on over the next number of years to improve those basic capacities there."

The World Health Organization reports pandemic influenza activity remains variable in Sub-Saharan Africa. Data suggests the most active areas of transmission continue to be in West Africa and in limited areas of East Africa, particularly in Rwanda.

It says Ghana and Senegal have the largest number of reported cases of H1N1 In West Africa.

Fukuda says the world is far better prepared to tackle influenza pandemics now than in the past. He says important lessons have been learned from past outbreaks.

CIDRAP

WHO sets up external panel to review pandemic response

CIDRAP, 29 March 2010
https://www.cidrap.umn.edu/h1n1-2009-pandemic-influenza/who-sets-external-panel-review-pandemic-response

Mar 29, 2010 (CIDRAP News) – The World Health Organization (WHO) today said it is in the final stages of putting together an independent committee to review its preparation for and response to the H1N1 pandemic, a group of about 29 experts that will meet for the first time in the middle of April.

Keiji Fukuda, MD, special advisor on pandemic influenza to the WHO director-general, shared details about the review group with journalists in Geneva. The WHO posted an audio recording of the press conference on its Web site.

Fukuda said the independent review will parallel another review effort within the WHO that will examine pandemic response as part of a required evaluation of how the International Health Regulations (IHR) functioned during the outbreak. He said the H1N1 pandemic was the first major test of the IHR, which are an agreement outlining how governments should handle global health emergencies.

Fukuda and other WHO health officials have often said the group looks forward to the lessons learned from its pandemic response. "The bottom line is how we can do better with our preparations and response," he said.

The review's timing isn't a signal that the pandemic is over, he said. Instead, the review comes one year into the pandemic, when health officials have accumulated a lot of experience with the response and the actions are still fresh in people's memories.

Some elected officials and health ministers have criticized the response of the WHO and governments, claiming that health officials overreacted to the disease threat and were influenced by pressure from pharmaceutical companies to buy vaccine stockpiles. The WHO and health authorities from several countries have strongly denied the claims.

The Council of Europe (COE) has launched its own inquiry into the WHO and governmental pandemic responses, and today in Paris the social, health, and family affairs committee of the COE's Parliamentary Assembly (PACE) held its second hearing on the issue. The COE, separate from the European Union, works on issues such as civil rights, economics, and democracy. The group was established after World War II and is made up of elected officials from 47 nations.

The WHO is still putting together the pandemic review group, which will have a broad range of expertise, including scientists and public health experts both inside and outside the infectious disease arena. Fukuda said that though the review group will operate independently from the WHO, members will be required, like the WHO's internal expert groups, to make declarations of interest and reveal potential conflicts of interest.

The group will hold its first meeting Apr 12 to 14. The committee will elect its own chair and cochair, set its own agenda, and seek out its own expert assessments. It will produce a preliminary report on its actions for the WHO director-general to present to the World Health Assembly in May.

Fukuda said the WHO anticipates that many countries will want to air their views with the new committee, and countries will have the opportunity to speak or submit written comments at the group's first meeting. Though there won't be a public gallery for the meetings, representatives from governments and other groups will be welcome to observe, and the WHO is still working out how to provide media access.

A final report on the WHO's pandemic response will likely be completed in time for the WHO director-general to present to the May 2011 World Health Assembly.

At today's COE hearing, Paul Flynn, a socialist member of the British Parliament, presented an initial inquiry report on the WHO's pandemic response. Flynn said the report reflects a recent meeting with Gillian Merron, Britain's public health minister. He said he will meet with WHO officials on Apr 15 to gather more information. COE said in a press release that the PACE committee will likely approve the report in late April, in advance of a possible debate on the topic in Strasbourg in June.

Today the committee focused on transparency issues related to the WHO and governmental pandemic responses. The group heard from Poland's health minister, Ewa Kopacz, about the country's decision not to buy pandemic vaccine.

Also on the agenda were Marc Gentilini, a member of France's National Academy of Medicine, who spoke on France's pandemic response; Dr Tom Jefferson, from the Cochrane Collaboration, who spoke on the use of scientific evidence when making flu-related decisions; and Michele Rivasi, a European Parliament member who is calling for that group to launch an inquiry. The European Parliament is an elected group and is one of the European Union's two legislative branches.

USA TODAY

H1N1 flu resurfaces in the Southeast

US Today, 29 March 2010, 7:26 PM
https://web.archive.org/web/20100418003554/http://www.usatoday.com/news/health/2010-03-30-swineflu30_ST_N.htm?csp=34

State and federal disease detectives have converged in Georgia to investigate a late-season flurry of people hospitalized with H1N1 flu, health officials said Monday.

Georgia reflects a "worrisome trend" of persistent flu throughout the Southeast, says Anne Schuchat, director of the Centers for Disease Control and Prevention's National Center for Immunization and Respiratory Disease.

Georgia, Alabama and South Carolina all report an increase in regional flu activity. Local clusters of cases have been reported in Arkansas, Louisiana, Mississippi, North Carolina, Tennessee and Virginia.

It's too soon to tell whether the situation in the Southeast heralds a new wave of illness nationwide, Schuchat says. "I'm worried about a different possibility – more cases occurring day in, day out" in people who believe H1N1, or swine flu, is no longer a threat.

Georgia's hospitalizations, and a sprinkling of deaths, began among adults in mid-February and have continued, says Patrick O'Neal, Georgia's director of emergency preparedness and response.

Each week since then, hospitals have reported at least 40 hospitalizations and no more than four deaths statewide, O'Neal says. "That doesn't sound like a lot," he says. "But we had dropped down to no hospitalizations at the end of December. Seeing 40 per week was a significant increase for us."

Most of those hospitalized have chronic illnesses, including diabetes, chronic lung disease and neurologic ailments. Pregnancy also raises a woman's risk of severe flu illness.

U.S. Surgeon General Regina Benjamin urged people Monday to get vaccinated, especially those in high-risk groups. O'Neal said parents should take children younger than 9 for the full set of two shots.

Paul Flynn MP

WHO calamity

Pail Flynn, MP, 30 March 2010
https://paulflynnmp.typepad.com/my_weblog/2010/03/who-calamity.html

Yesterday was a whirlwind of good science and courageous politics. The *Polish Minister of Health explained* how she was threatened by the vaccine manufacturers. They wanted the Polish Government to take responsibility for the adverse reactions to the flu vaccines that they were trying to sell her. As a health professional she was aware that the vaccines were untried and the threat from swine flu was slight. She resented the blackmail that said she would be blame when 10s of thousands of deaths occurred. *She ordered no vaccine and saved her country a fortune*. In the UK we ordered enough vaccines for 80% of the population. Less than 10% was used.

The outcome in the two countries in the numbers of death and the incidence of the disease was roughly the same ! This is the press release that the Council of Europe published this morning.

Paris, 29.03.2010 – “The next time someone cries wolf over a pandemic, the overwhelming majority will not take it seriously,” participants were told today at a parliamentary hearing on the handling of the H1N1 pandemic, organised in Paris by PACE’s Social, Health and Family Affairs Committee.

“A pandemic can be whatever the WHO declares it is. If it turns out that former PACE member Wolfgang Wodarg was right when he said the pandemic was decided to help the pharmaceutical industry make bigger profits, this might well turn out to be one of the biggest health scandals ever,” said Paul Flynn (United Kingdom, SOC), PACE rapporteur on this issue.

Participants also expressed regret at the WHO’s failure to revise its position on the pandemic, and warned against a possible repetition of events if no lessons were learnt. “The world no longer trusts the WHO, but we need a body of this kind and it must therefore restore its own credibility,” Mr Flynn added.

He paid tribute to the rare courage of the Polish Health Min ist er Ewa Kopacz, who had refused to be held hostage by the pharmaceutical industry and did not order vaccines. She said that drug company profit should not be more important than people.

She urged the WHO to urgently re-examine their position and decrease the pandemic alert level. She also denounced the lack of solidarity among European states when the pandemic was declared and the lack of co-ordination at EU level. Marc Gentilini, an expert in infectious diseases who is a former President of the French Red Cross, regretted that there was no such thing as a European health policy and called for the building of what he called a Europe of Health: “The precautionary principle is not a political umbrella to be abused,” he said.

Health researcher Tom Jefferson, of the independently-funded Cochrane Collaboration, stressed that parliamentary democracy was the best means of ensuring that private interests do not prevail over the sovereignty of states: “We trust democracy to have a surveillance system that works. The public health sector may not rely on privatised expertise,” he warned, underlining that so-called experts did not emerge like daisies but were “created and made into key opinion-leaders”.

Michèle Rivasi, a member of the Green Group in the European Parliament, who is calling for an inquiry by MEPs into the handling of the ‘flu pandemic, illustrated what she called “the chronicle of a pandemic foretold” and denounced the rush with which the WHO had announced the pandemic. She asked whether we were getting the whole truth from the WHO. She said it was important for PACE and the European Parliament to work together on this issue.

The participants also regretted that the WHO had not accepted the invitation to participate in this second hearing.

CDC hypes return of swine flu to USA, blames low vaccination rates
Pandemic Influenza Strain Persists in Southeast, Top Doctors Say

ABC News, 30 March 2010, 13:56
https://abcnews.go.com/Health/SwineFluNews/georgia-h1n1-cases-spike-low-vaccination-rates-blamed/story?id=10238235

Health officials are carefully watching a spike in cases of the pandemic H1N1 flu in the Southeastern United States.

Georgia is particularly worrisome, with 40 people admitted to hospital for the flu last week – more than in any other state, according to Dr. Anne Schuchat, director of the CDC's National Center for Immunization and Respiratory Diseases.

Georgia has outpaced the rest of the nation in laboratory-confirmed H1N1 flu cases admitted to hospitals for the past three weeks, Schuchat said in a telephone press conference Monday.

The press conference – the first in several weeks to discuss the pandemic – was called largely because of the situation in Georgia, she said. The rate of H1N1 disease overall nationally is lower on average than last fall.

The increase in Georgia is "unusual, and we did want to spotlight that," she said.

Schuchat added that the number of hospital cases in the state is higher now than it was in early October, and since many cases of influenza-like illness are not tested for the virus, it's possible that the number is underestimated.

As well, she said, "H1N1 has been causing more disease recently in the Southeast." Georgia is one of three states reporting regional flu activity, she said. The others are Alabama and South Carolina.

Six other Southeastern states – Arkansas, Louisiana, Mississippi, North Carolina, Tennessee, and Virginia – plus Hawaii, New Mexico, and Puerto Rico are seeing local flu activity.

The flu that's causing anxiety in Georgia, Schuchat said, is caused by the H1N1 strain and is mainly affecting adults with underlying conditions. The virus itself has not changed, she said.

Schuchat said most of the people affected by the flu in Georgia have not been vaccinated, and indeed the state had one of the lowest vaccination rates in the country.

Although investigation of the spike is still under way, she said, the CDC decided to call attention to it in order to reinforce the message that vaccination remains an important preventive measure.

Surgeon General Dr. Regina Benjamin said the supply of H1N1 vaccine last week reached 24 million doses "but many Americans are still vulnerable to the H1N1 (flu) because they haven't gotten vaccinated yet."

She added that minorities are staying away from the vaccination program, even though they have higher rates of some of the underlying diseases that make the flu more dangerous.

Benjamin added that an estimated 60 million Americans have been infected by the virus, 265,000 have needed inpatient care, and nearly 12,000 have died.

While the death figure is lower than the 36,000 usually attributed to seasonal flu every year, Schuchat said that's misleading. Most of the deaths occurred among people younger than 65, where the death rate is five times higher than usual.

On the other hand, those over 65 have been "relatively spared," she said.

Schuchat added that the seasonal flu has been largely missing in action so far. "We've not seen seasonal flu in substantial numbers at all," she said.

Die Schweinegrippe ist offenbar zurück!

BILD, 30 March 2010, 14:58 UHR
https://web.archive.org/web/20100603142631/http://www.theflucase.com/index.php?option=com_content&view=article&id=3181%3Abild-newspaper-scare-mongers-over-third-swine-flu-wave&catid=1%3Alatest-news&Itemid=64&lang=en

Experten aus den USA beobachten einen erneuten Anstieg von schweren Erkrankungen und Todesfällen – droht jetzt die dritte Welle der H1N1-Epidemie?

Vor allem im US-Bundesstaat Georgia werden seit Mitte Februar plötzlich wieder zahlreiche infizierte Menschen ins Krankenhaus eingeliefert, mehrere Menschen starben, berichtet die Zeitung "USA Today".

Auch Alabama und South Carolina verzeichnen einen regionalen Anstieg der Grippe-Fälle.

In Arkansas, Louisiana, Mississippi, North Carolina, Tennessee and Virginia werden lokal vermehrt Erkrankungen bekannt.

Und die Zahl wächst weiter: Jede Woche berichten Kliniken von mindestens 40 Personen mit Schweinegrippe und bis zu vier Todesfällen im gesamten Staat, sagt Patrick O'Neal, Leiter des Notfallschutzes von Georgia.

"Das klingt nach wenig, aber Ende Dezember waren die Krankhaus-Einlieferungen auf Null gesunken. Plötzlich 40 neue Patienten die Woche sind ein deutlicher Anstieg für uns", erklärt O'Neal.

Die meisten eingelieferten Menschen leiden unter chronischen Krankheiten wie Diabetes oder Lungenerkrankungen. Auch Schwangerschaft erhöht das Risiko, an der Grippe zu erkranken.

Anne Schuchat, Leiterin des Nationalen Centers für Krankheiten und Prävention (DCD), spricht von einem "beunruhigenden Trend" von hartnäckigen Grippefällen.

Es ist zu früh zu sagen, ob die Situation im Südosten des Landes der Vorbote einer neuen bundesweiten Grippe-Welle ist, sagt Schuchat.

Aber: "Eine andere Möglichkeit macht mir Sorgen", sagt die Expertin und beklagt "immer mehr Fälle, tagaus, tagein" von Menschen, die glauben, das H1N1-Virus oder die Schweinegrippe wären keine Bedrohung mehr.

US-Generalchirurgin Regina Benjamin mahnt die Menschen, sich impfen zu lassen, besonders die gefährdeten Risikogruppen. Auch Notfallschutz-Leiter O'Neal rät Eltern, ihre Kinder unter neun Jahren mit den beiden nötigen Impfspritzen gegen die Schweinegrippe zu schützen.

=> Germany's Bild newspaper is hyping the return of a "third swine flu wave", quoting the CDC in Atlanta in preparation for new vaccine push.

EXPRESS

WHO's swine flu response examined

Express, (UKPA), 30 March 2010, 05:24
https://www.express.co.uk/news/world/166045/WHO-s-swine-flu-response-examined

Experts will investigate the World Health Organisation's response to the swine flu outbreak and probably examine whether it could have been clearer when it declared a pandemic of what turned out to be a relatively mild disease.

The independent review will be conducted by around 30 scientists and health chiefs and their initial findings will be presented to member states in May, said Keiji Fukuda, WHO's top flu official.

WHO's pandemic alert scale, or "phases" and the role that disease severity plays in the global body's assessment of an outbreak were likely to be among the "critical issues" the group would examine, he said.

Several governments urged WHO last year not to declare swine flu a pandemic, saying it could cause unnecessary alarm if the virus turned out to be harmless.

But the United Nations health agency went ahead, arguing that the term pandemic signifies only that a new strain is circulating worldwide, but says nothing about how dangerous it is.

Dr Fukuda insisted that the choice of word was correct, but acknowledged that the term pandemic may have caused confusion among some who later accused WHO and others of overplaying the threat the virus posed.

Finding "what is the best way to convey the magnitude of risk" would likely be a key issue for the expert group to discuss, particularly with a view to improving communication during future disease outbreaks, he said.

"A lot of attention will be spent on how do you do that in a way that is clear in Egypt, London or Anchorage, Alaska," he added.

The expert group, which will include "very well-known scientists", will hold its first meeting from April 12-14 and consultations would probably continue over the course of the year, Dr Fukuda said.

A final report will be presented at the WHO's annual meeting of member states in May 2011, he said. WHO is holding a separate, internal review of its handling of the outbreak.

"Swine Flue" Topples down Bulgaria's Health Minister

Standard, 1 April 2010 11:43

https://web.archive.org/web/20100403021048/http://paper.standartnews.com/en/article.php?d=2010-03-31&article=32664

The swine flu overthrew a Bulgarian minister. Bozhidar Nanev - minister of health tabled his resignation after the prosecution's office accused him of signing an unprofitable deal. "With that deal the minister has defrauded the state revenue by 2.5 million leva (1 euro=1.95 leva)," announced Margarita Nemska - monitoring prosecutor on the first case against a minister from the incumbent cabinet. She explained that Bozhidar Nanev has signed two contracts for delivery of "Tamiflu" - vaccine combating swine flu, at a price was much higher than the offered by another company.

The delivery of medicines occurred a month and a half after the officially announced end of the flue epidemics.

"The case is really a very grave one," Nemska was explicit.

Nanev's case has been investigated by agents from the State Agency for National Security and the PM reportedly ordered the checks personally. A day ago SANS discovered the fraud and reported to Bulgaria's Prosecutor General who ordered an investigation and according to the conclusions of the prosecutors, charges were launched.

Microchipping to Begin – Under New Health Bill

The Flu Case, 6 April 2010, 11:36
https://web.archive.org/web/20100413225746/http://www.theflucase.com/index.php?option=com_content&view=article&id=3207%3Amicrochipping-to-begin-under-new-health-bill&catid=1%3Alatest-news&Itemid=64&lang=en

The new Health Care Bill, H.R. 3200, just passed by Congress has within it the requirement that all people thereunder shall be microchiped. The plans for this microchipping has been in the hooper going back to December of 2004.

Witness the actual FDA (Food and Drug Administration) document dated December 10, 2004 entitled Class II Special Guidance Document: Implantable Radiofrequency Transponder System for Patient Identification and Health Information. This ten page document may be read on the FDA website at =>
https://web.archive.org/web/20090710201325/http://www.fda.gov/downloads/MedicalDevices/DeviceRegulationandGuidance/GuidanceDocuments/ucm072191.pdf

Now witness the wording within H.R. 3200, America's Affordable Health Choices Act of 2009 found on Congresses™ House Ways and Means website, =>
https://web.archive.org/web/20090805013455/http://waysandmeans.house.gov/media/pdf/111/AAHCA09001xml.pdf

On page 1001 is Subtitle C National Medical Device Registry which states, The Secretary shall establish a national medical device registry (in this subsection referred to as the registry™) to facilitate analysis of postmarket safety and outcomes data on each device that … is or has been used in or on a patient…

In other words, everyone microchipped pursuant to the new Health Care Bill must be registered with the Secretary. The Secretary is defined as the Secretary of Health and Human Services.

The date by which this registry is to begin is mandated on page 1006, which is 36 months after the Health Bill becomes law.

(2) *Effective Date.* – The Secretarry of Health and Human Services shall establish and begin implementation of the registry under section 519(g) of the Federal Food, Drug, and Cosmetic Act, as added by paragraph (1) by not later than the date that is 36 months after the date of the enactment of this Act, without regard to whether of not final regulations to establish and operate the registry have been promulgated by such date.

Therefore, under the law of H.R. 3200 recently passed by Congress, microchipping of Americans must begin by the year 2013.

Now you know what is behind the new Health Bill, H.R. 3200.:

Swine flu scare was exaggerated

Mid-Day, IANS, 6 April 2010, 06.23 pm IST
https://www.mid-day.com/author-detail/ians-14
https://www.news18.com/news/india/swine-flu-scare-was-exaggerated-who-336143.html

World Health Organisation admitted that the scare was exaggerated as alleged by several countries, including India

The World Health Organisation (WHO) on Tuesday admitted that the swine flu scare was exaggerated as alleged by several countries, including India, but it declined to comment whether it was done to benefit global pharmaceutical companies.

"Yes, it was," Samlee Plianbangchang, regional director of WHO southeast Asia, said in a reply to a question on whether H1N1 scare was exaggerated by the global health watchdog.

However, WHO authorities declined to comment whether the hype was created by the global health agency to benefit pharmaceutical companies.

"It will be answered by our designated spokesman," a WHO spokeswoman said.

The UN health watchdog declared Influenza A (H1N1) as a pandemic in 2009 after the disease broke out across the globe.

India has already expressed its displeasure and demanded an investigation into "unnecessary scare" created by the WHO.

Minister of state for Health and Family Welfare Dinesh Trivedi has said that it was important to find out whether there was ever a nexus between pharmaceutical companies and WHO which made the global health watchdog declare H1N1 flu a pandemic virus.

"We definitely demand an inquiry. WHO is not god," Trivedi had told reporters.

The global health watchdog had said that the pandemic will affect at least one-third of the global population and this created a lot of panic around the globe. However, the impact was much less than expected.

India, a country of over 120 crore, saw a little over 30,000 infections since May 2009 till date. Of these, 1,465 people have died till April 5, 2010. But going by the WHO forecasts, over 33 crore people were expected to be afflicted by the virus.

While several companies across the world are busy making the vaccine, India has already imported 1.5 million doses from the multinational firm Sanofi Pasteur. An Indian vaccine is yet to reach market.

2nd International Swine Flu Conference
August 18-19, 2010 Washington, DC

April 7, 2010

Dale Manuel
Commissioner
Jefferson County, West Virginia

Re: 2nd Int'l Swine Flu Conference via fax 3047257916

Dear Dale Manuel,

We are pleased to invite you to attend the 2nd International Swine Flu Conference, August 18-19, 2010 in Washington, DC.

WHO announced last week that more than 213 countries and overseas territories have reported cases of pandemic influenza H1N1, including at least 17, 483 deaths.

In the two-day event, public health officials, policy makers, scientists, and business leaders will focus on effective planning and preparation, improved coordination among all sectors to survive a global pandemic.

Break-out Session include:
- Breakout 1. **Business Continuity Planning**
- Breakout 2. **Continuity of Operations (COOP) and Continuity of Government Planning**
- Breakout 3. **Emergency Management Services**
- Breakout 4. **Law Enforcement Agencies**
- Breakout 5. **School/University Pandemic Planning**
- Breakout 6. **Workplace-based Planning**
- Breakout 7. **Hospital and Emergency Medical Services**
- Breakout 8. **Airlines, Travel, Airport, Quarantine and Border Health Services**
- Breakout 9. **Infectious Medical Waste**
- Breakout 10. **H1N1: Agricultural Perspective & Intervention**

Not registered yet? You may register in any of the following ways:
Call us at 202-536-5000. Or download the PDF registration form:
http://www.new-fields.com/2ndISFC/registration.pdf

Looking forward to working with you in this global effort to fight this panademic.

Sincerely,

Virginia Blanco, Project Manager
H1N1 Task Force
Virginia.Blanco@New-Fields.com

THE FLU CASE

Which is next? An engineered pandemic or debt implosion?

The Flu Case, 7 April 2010, 19:17
https://web.archive.org/web/20100413225818/http://www.theflucase.com/index.php?option=com_content&view=article&id=3234%3Awhich-is-next-an-engineered-pandemic-or-debt-implosion&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The global elite have been planning for decades to destroy the nation states in the European Union as well as the USA using biowarfare and also financial warfare to pave the way for the establishment of a one-world government under their control with the UN, WHO and IMF serving as their vehicles.

The elite's financial weapon of choice appears to be debt implosion; and their preferred timing for detonating this weapon looks to be in the next few weeks.

...

The implosion of our economies appears to have been planned to take place under the cover of pandemic martial law.

This was to have been implemented by WHO in conjunction with national governments under the pretext of a swine flu pandemic last year.

Because the swine flu pandemic failed to deliver martial law and mass deaths, the US government has now just pushed through a health bill with the key element of compulsory medical treatment that was in the national pandemic plan.

Under the Healthcare Bill, people can be forced to take vaccines, however unnecessary or even dangerous they might be. We know the global elite want a major population reduction, especially of the young, the elderly, the sick.

Now that the hurdle of controlling social and political unrest in the USA has been cleared, the globalists appear to be moving to the next stage – the implosion of our economies by detonating the debt bomb.

The fuse was lit when Greece was "found" to have budget deficit equivalent to 12.7 percent of gross domestic product earlier this year. In the meantime, we know Goldman Sachs helped contrive this mountain of debt and dramatize it by selling unsecured swaps.

We, the people, have to reclaim our governments, which have been so corrupted.

We might have to face economic meltdown and shocks, false flag nuclear wars in Iran and martial law in the near future. But we must focus on accomplishing our mission: the restoration of Constitutional and honest government.

One practical step in the fight against totalitarian government is preparing to set up regional currencies for use in an emergency.

Another meeasure is setting up community-supported agriculture and food projects.

A third step could be setting up local community banks.

THE IRISH TIMES

Carl O'Brien

Swine flu - pandemic or manipulated panic?

The Irish Times, 10 April 2010, 01:00
https://www.irishtimes.com/news/swine-flu-pandemic-or-manipulated-panic-1.650611

To guard against thousands of possible deaths, the Government set aside €80 million for swine flu vaccines, only a fraction of which were used. Was it an over-reaction, or a Catch-22 situation?

Quietly, and with barely a flicker of media interest, the last weekly briefing note on the swine flu pandemic was released a week ago. There wasn't much to excite even the most news-starved of reporters. Influenza activity was low. There had been no confirmed reports of swine flu. The vaccination campaign against the virus had officially drawn to a close.

This was in stark contrast to a few months earlier. Special weekly press conferences at Government Buildings were packed with media to hear top-ranking health officials talk about the public health threat facing the State.

Somehow, more than €80 million was scrambled together by health authorities to buy millions of vaccines, as well as anti-virals, masks and goggles. The national influenza pandemic plan was dusted down, along with the possibility that schools, universities and workplaces could be closed down as a protective measure. Most measures avoided creating a sense of panic, but it didn't always work. The media stoked fears, speculating that special morgues would be set aside and that the Army could be called in. A distinguished UK virologist even raised the possibility that swine flu could travel south and mix with bird flu to create “Armageddon flu”.

In the end, the consequences weren't nearly as bad as was feared. The H1N1 virus turned out to be a relatively mild strain compared to the more deadly avian flu (which killed one-third of those infected). About 5 per cent of the Irish population contracted the H1N1 virus, and 24 people died. Health authorities now find themselves saddled with two-thirds of the swine flu vaccines unused.

Given that in a typical flu season around 300 to 400 people die of flu-related illnesses, many are beginning to question whether health authorities over-reacted to the scale of the problem. To add into the mix, sceptics such as Wolfgang Wodarg, former chairman of the health sub-committee at the Council of Europe, say the swine flu outbreak was a “false pandemic” driven by drug companies which stood to make billions from a worldwide scare.

The biggest worry facing some health experts is that public trust may have been undermined – so the next time a pandemic disease hits, people may not take it seriously, a situation that could put the whole population at risk. Dr Kevin Kelleher, head of health protection at the Health Service Executive, played a key role in co-ordinating the State's response to the swine flu threat.

“I don't think we over-reacted,” says Dr Kelleher. “If you were to speak to people who had the swine flu, or to the families of those who died, you would get a very different picture. Maybe our reaction reduced the scale of the people affected . . . People were given advice, vaccinations were provided. I'd be happy to debate our reaction with anyone.”

One issue is the national pandemic influenza plan, a detailed guide drawn up for health authorities three years ago. But this was written with the avian flu in mind, which is far more severe, and envisages a scenario where the first wave of a pandemic could result in anything up to 50,000 deaths.

"Yes, the swine flu wasn't as severe as we might have feared, but it still had a major impact," says Dr Kelleher. "We are looking at lessons learned, but the plan was adapted as we went on to the emerging situation." One key adaptation, for example, was that hospitals continued to operate normally; whereas the plan envisages health services being forced to take drastic action to deal with a pandemic.

Prof Patrick Wall, associate professor of public health at UCD, takes a similar view, and says the health authorities got it right.

When the virus first emerged last April, he was quick to dampen any sense of panic. He said the swine flu appeared to be similar to ordinary flu and warned against over-reacting.

"Looking back, I suppose I was half right and half wrong," Prof Wall says. "It wasn't Armageddon. But it wasn't an ordinary version of the flu, either. It affected young people and pregnant women disproportionately. It was very serious for those vulnerable groups." There was always the possibility that a second wave of the flu could have been much more life-threatening, he says.

"As far as world health agencies are concerned, they were damned if they did and damned if they didn't [declare] a pandemic. I thought Tony Holohan [chief medical officer at the Department of Health] put it well last year. While the flu appeared to be mild, he said there were no grounds for complacency. That was good advice."

Ultimately, Ireland was guided by the World Health Organisation (WHO) in how it responded. Its emergency committee made a crucial decision on June 11th, declaring that an influenza pandemic had broken out, for the first time in just over 40 years.

As the WHO's director of global outbreak alert and response network, Dr Mike Ryan played a key role in shaping the organisation's response. "I feel very comfortable that the right calls were made at the right time," says Dr Ryan, originally from Co Sligo and now based in Geneva. "We live in a world of risk management. And this was a new strain of virus which was spreading like wildfire around the world and to which humans had no immunity. People were dying in intensive care, pregnant women were dying, under-twos were dying and the virus was adapting." A pandemic, or "phase six" on the WHO's warning system, occurs when a new virus is spreading uncontrollably in several regions of the world.

While the organisation's previous definition referred to a virus that created a "high mortality rate", this was left out of a more recent and revised definition.

On its website, the answer to the question "What is a pandemic?" included mention of "an enormous number of deaths and cases of the disease" – until May 4th, 2009.

That was when a CNN reporter pointed out the discrepancy between this description and the generally mild course of the swine flu. The language was quickly removed.

Some sceptics say a group with strong connections in Geneva had a strong interest in phase six being declared: the drugs industry. Once a pandemic was declared, sleeping contracts to supply millions of vaccines to dozens of governments around the world would automatically come into force.

"Sometimes you get the feeling that there is a whole industry almost waiting for a pandemic to occur," Tom Jefferson of the Cochrane Collaboration, an international non-profit organisation, told German news magazine Der Spiegelrecently. "And all it took was one of these influenza viruses to mutate to start the machine grinding."

Dr Ryan of the WHO rejects any suggestion that the pharmaceutical industry pressurised the organisation into declaring a pandemic. "It beggars belief that we would risk the integrity of our massive health agenda globally by helping companies to make short-term profits. It's simply not in our interest to do so," he says.

It is almost impossible to know the severity of a pandemic in its early stages, he adds, given the ability of flu strains to mutate quickly and impact differently among diverse populations.

Ireland was one of many countries that had signed agreements with vaccine manufacturers to supply pandemic jabs. It paid some €6 million in "hello money" to vaccine makers – just to secure access to supplies when they became available.

In addition, it ordered 7.7 million vaccines, enough for two doses for each member of the population at a total cost of close to €80 million. This included equal batches of Pandemrix, a vaccine made by GlaxoSmithKline, and Celvapan, made by Baxter.

Months later, however, it emerged that a shot of Pandemrix was sufficient for both children and adults, except those with weakened immune systems.

As a result, the Government renegotiated its contract with Baxter, saying it would not take up close to four million doses of its vaccine, saving up to €35 million in the process. However, it is still left with two-thirds of the vaccine that arrived in the country. It is in talks with GlaxoSmithKline over how to honour a contract worth between €5 million and €15 million. Most developed countries face a similar problem, but not everyone.

Poland's government, which chose not to buy the vaccine, feels vindicated by its stance. While opposition parties grumbled, its health minister, Ewa Kopacz, told the parliament: "Is it my duty to sign agreements that are in the interest of Poles, or in the interest of the pharmaceutical companies?"

So, what lessons can be learned from the swine flu pandemic? The WHO, for its part, has announced that an external panel will review the decisions it took over the handling of swine flu as part of a process which begins on Monday.

John MacKenzie, the chair of the organisation's emergency committee, a group of 15 health experts from around the world, has already suggested that the WHO's definition of a pandemic may need to be fine-tuned to include severity.

Dr Ryan feels that while its response was speedy and effective, there could be room for improvement on aspects of communications. "Was there unnecessary confusion in this pandemic versus the seriousness of something like H5N1 [avian flu]? That's something that will be looked at." For **Prof Patrick Wall**, the allegations against the WHO are serious and need to be addressed – if only to ease the public concerns.

"These allegations need to be banged on the head and sorted out, " he says. "An inquiry might help us learn lessons from this."

Swine Flu in Numbers:
22 million – The cost in euro of buying and administering vaccines in Ireland
1.9 million – Number of unused doses of pandemic vaccines in Ireland
1.1 million – Number of doses of pandemic vaccine administered in Ireland
16,931 – Number of deaths worldwide linked to swine flu
4,584 – Number of confirmed cases of swine flu notified in Ireland
25% – The proportion of the population that received the vaccine
24 – Number of deaths in Ireland linked to swine flu

WHO pandemic probe focuses on media, Internet role

Google – Host News, AFP, 13 April 2010

https://web.archive.org/web/20100517020117/http://www.google.com/hostednews/afp/article/ALeqM5hTYjXT1VALSJAJKgjnRtFE3bom1Q

GENEVA – The Internet had a disruptive impact on the handling of the flu pandemic by fanning speculation and rumours, officials said as a world health probe on Tuesday examined communications on swine flu.

World Health Organisation influenza chief Keiji Fukuda told 29 health experts reviewing the international response to the pandemic that the Internet had added a new dimension to flu alerts over the past year.

While it meant information about swine flu became more widely available, it also produced "news, rumours, a great deal of speculation and criticism in multiple outlets," including blogs, social networking and websites, he said.

"Anti-vaccine messaging was very active, made it very difficult for public health services in many countries," Fukuda said as a nine-month review of the A(H1N1) flu pandemic got under way.

Several governments have been trying to cancel orders for hundreds of millions of dollars' worth of special swine flu vaccines.

Mass vaccination campaigns in Europe last year fell flat amid public doubts about the value of immunisation because of milder than expected swine flu symptoms, speculation about the safety of the vaccine and concern about the influence of the pharmaceutical industry.

Fukuda also pinpointed the speed with which information spread and its influence on "volatile" public opinion, admitting that the WHO had struggled to find the "right tempo" for communications.

"We saw confusion over many of the words and phrases used in the pandemic," he added.

While the Internet is regarded as an essential conduit for information, many members of the health community believe it has also amplified the impact of sensationalist claims or blogging by self-styled experts, with little in the way of checks or balances.

Examples cited included a six-part video by a Spanish nun debunking the threat of A(H1N1) flu posted online, websites dedicated to "fake pandemic" claims, or the global reach of rumours exchanged by e-mail or social networking chatter.

Former WHO infectious diseases chief David Heymann told AFP that public health community had to take into account a "new factor" with the Internet and social networking.

"It's very difficult to correct any misperception," said Heymann, now chairman of the Health Protection Agency in Britain and a researcher on global health strategy.

Several governments on Monday urged the review to look at the broad issue of communications in the pandemic.

France indicated that authorities had struggled with the speed with which information got around, and suggested that some WHO recommendations had come too late.

"It emerged that the media timescale was far shorter than the political and administrative timescale, which may have complicated national decision making," a French delegate told the panel.

The WHO's International Health Regulations Review Committee Tuesday set communications as one of its five core subjects, with a first examination later in the day.

"Media should be one part of the communications strategy" review, panel member Tjandra Aditama, of Indonesia's health ministry, said earlier.

The review panel's final overall report on the handling of the pandemic is due by January 2011, a WHO spokesman said.

The INDEPENDENT

Jeremy Laurance

Governments accused of panicking over swine flu

The Independent, 22 April 2010
https://www.independent.co.uk/life-style/health-and-families/health-news/governments-accused-of-panicking-over-swine-flu-1950700.html

A blizzard of inquiries into the handling of the swine flu pandemic, which began one year ago, have been launched amid allegations that governments around the world over-reacted to the threat.

The World Health Organisation (WHO) has been accused of crying wolf over its decision last June to declare the H1N1 virus a pandemic, the first for 40 years, which could turn out to be the weakest in history. Up to 15 April there had been 474 deaths from swine flu in Britain, mostly in the age group 15 to 44, compared with 2,000 to 4,000 from seasonal flu in an average year, which targets the elderly.

Seasonal flu was driven out last winter by the novel H1N1 pandemic virus, which may therefore end up having saved lives overall from flu in the 2009-10 season.

Early in the pandemic, the Department of Health said it was planning on the basis of a "worst case scenario" of up to 65,000 deaths. That figure was revised down to 1,000 deaths in the autumn, as the virus turned out to be milder and to have spread further than had been thought.

About 5.5 million people have been vaccinated in Britain, but uptake has been low among frontline health workers and groups at risk, at just 30 per cent. The Government, which ordered 100 million doses of vaccine, announced earlier this month that it had "over-bought" 30 million doses, worth £150m, which were now being exchanged for other products.

The most advanced inquiry, being conducted by the Council of Europe, began in January. Paul Flynn, the British Labour MP who is drafting its report, has called attention to the discrepancy between the scale of the warnings and the actual threat. "The next time someone cries wolf over a pandemic, the overwhelming majority will not take it seriously. A pandemic cannot be whatever the WHO declares it to be," he said. The WHO has launched its own inquiry and the European Commission is under pressure from MEPs to establish a separate investigation. In Britain, the Government has announced an independent review chaired by Dame Deirdre Hine.

British experts defended the national and international response to swine flu at a briefing organised by the Science Media Centre in London yesterday. Professor Robert Dingwall, former director of the Institute for Science and Society at the University of Nottingham, said it was better for governments to prepare for the worst and then scale measures back than be faced with having to do the reverse. "Governments are damned if they act and damned if they don't," he said.

Professor Neil Ferguson, of the department of Infectious Disease Epidemiology at Imperial College, London, said assessments of the pandemic in the early months were broadly accurate.

"The difficult thing was tracking how many people were being infected. That was critical to tell how severe the virus was. We saw some people dying but we couldn't put those numbers in perspective." The uncertainty led to predictions that the autumn wave of infections could be up to three times greater than the summer wave but in the event it was about the same size. "The challenge is to develop more rapid diagnosis to overcome the problem of tracking the pandemic. Aspects of surveillance could be improved. Had we known what we were getting we would have responded at a lower level."

The Telegraph

Swine flu will be back in the winter: scientists

Swine flu will return in the winter and thousands of people could become infected, scientists have warned

The Telegraph, 22 April 2010, 7:15AM BST
https://www.telegraph.co.uk/news/health/swine-flu/7614164/Swine-flu-will-be-back-in-the-winter-scientists.html

The pandemic is not over and the H1N1 virus is likely to return in the winter when flu would normally be expected, scientists have said.

Despite the feeling that most people have already had the bug, even if they didn't show symptoms, tests have shown that in some areas of the country 85 per cent have not yet contracted H1N1.

Uptake of the vaccine has varied from around 10 per cent to 30 per cent of those offered it so many of the most vulnerable are not protected, they said.

Prof Neil Ferguson, Director of the MRC Centre for Outbreak Analysis and Modelling, Dept of Infectious Disease Epidemiology, Imperial College London, said there has been a resurgence of cases in the southern states of America and this time H1N1 appears to be striking older people.

Prof Peter Openshaw, Director of the Centre for Respiratory Infection at the National Heart and Lung Institute, at Imperial College London added: "The perception is that everyone has had it therefore won't get it again. In London and the West Midlands up to 40 per cent of schoolchildren have had it but they are the exception. In most regions it was about 15 per cent so there are still a lot of people still to be infected."

The scientists said despite criticism that the pandemic was overplayed, the response by the British Government was proportionate given what was known at the time.

They described it as a 'dry run' for a more serious pandemic and said valuable lessons will be learned about communicating risk to the public and how to track cases in the general population.

Prof Ferguson said the number of people who died from swine flu was probably underestimated in England because of the way the data was collected.

In the year since the outbreak 474 deaths have been attributed to swine flu in the UK.

Prof Ferguson said reasonable worst case scenarios for the NHS to plan for suggested early on that there could be 65,000 deaths and he said this was not unreasonable. However this was communicated as a prediction of what would happen when in actual fact is was a worst case to plan for when in reality far fewer deaths were expected.

Prof Openshaw added that even though the assumption is that H1N1 is a mild disease, the majority of deaths were in younger age groups than normal and 40 per cent of them had been fit and well previously.

"This was still an exceptional outbreak of flu", he said.

It is still not known why the disease struck people with asthma, pregnant women and those with diabetes.

He said it was hard to predict if H1N1 would behave more like normal seasonal flu when it returns or if it will retain some of these pandemic traits.

FIERCE Pharma

Swine flu outbreak: One year later

Fierce, 22 April 2010, 9:40 am
https://www.fiercepharma.com/vaccines/swine-flu-outbreak-one-year-later

Was the World Health Organization's response to the swine flu pandemic reasonable or over the top and tainted by commercial interests? Both *USA Today* and *AFP* take a look at the WHO's response to the swine flu pandemic a year after the discovery of the deadly virus.

"It's a decision which costs huge amounts of money, which frightened people throughout the world unnecessarily," said Paul Flynn, a British parliamentarian who has led a Council of Europe inquiry on the issue. According to *AFP*, Flynn says that massive sums were spent on anti-virals and vaccines, which went largely wasted as skeptical populations refused to get vaccinated. He lambasted the WHO's actions: "The next time someone cries wolf over a pandemic, the overwhelming majority will not take it seriously. A pandemic cannot be whatever the WHO declares it to be," he says, as quoted by the *Independent*.

For example, in France the purchase of 94 million vaccines cost the state around €600 million ($798.2 million), but only less than 10 percent of the population went to get vaccinated, *AFP* reports. And the U.K. government ordered 100 million doses of vaccine, but announced earlier this month that it had "over-bought" 30 million doses, worth £150 million ($230.2 million), which were now being exchanged for other products, the *Independent* reports.

While governments rushed to cancel massive vaccine orders, critics railed against drugmakers that they see as having benefited handsomely and decried the WHO's response. But others have come to the organization's defense: "A lot of the criticism is political. I've not heard criticism from any virologist," says John Oxford, a virologist and professor at Queen Mary's School of Medicine and Dentistry in Britain.

And although the WHO is looking into its own response to the pandemic, its flu expert Keiji Fukuda said that the body has "to have room to make decisions that are different from what the plans call for," as quoted by *USA Today*.

The article, which focuses on the U.S. government's response, points out that responders had to be nimble; for example, they couldn't have anticipated that flu would pop up in the spring, when the world's vaccine producers were already busy preparing seasonal flu vaccine for the fall. Furthermore, it came at a time when the Obama administration was in its infancy and was racing to fill key positions, among them the secretary of Health and Human Services.

University of Michigan flu expert Arnold Monto gives the federal government high marks for its actions. "I think the U.S. response was totally appropriate," he says, as quoted by *USA Today*. "We did get a little panicked at first, but when you're apprehensive about what's coming your way and getting reports of deaths flooding in from Mexico, that's understandable."

THE FLU CASE

More independent websites censored
Watch for new pandemic scare, says David MacPhail

The Flu Case, 6 May 2010 11:59
https://web.archive.org/web/20100517160424/http://www.theflucase.com/index.php?option=com_content&view=article&id=3415%3Amore-independent-websites-censored-watch-for-new-pandemic-scare-says-david-macphail&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Fear, shock and the censorship of the independent media will be the key to any successful new mass vaccination campaign by WHO and pharamceutical companies, argues David MacPhail:

"The Medical Veritas web site went down recently and today Mike Adams has reported that within hours after his video interview with Jeffrey Smith about GMOs went live, YouTube censored it, claiming it "violated" their terms of use. Clearly there are powerful forces at work.

I fear that Jean-Jacques warning that another mass vaccination campaign is imminent and will come on very suddenly with little or no warning is prescient. While there may be different views as to why mass vaccination is being aggressively pushed it seems to be an important component of global control."

[WHO and the pharmaceutical companies appear to be using their review of the failed swine flu vaccination campaign for no other purpose than] to identiy and assess camps of opposition and the methods by which the campaign was opposed which was mostly through the internet.

In view of recent events with yours and several other web sites it is probable that in the wave of swine/bird flu that is coming one of the first things that will happen is that sites like The Flu Case will be attacked and disabled.

The main reason the H1N1 campaign failed was because it did not develop sufficient fear to gain compliance of the majority. Had the batch of [seasonal flu] vaccine [contaminated by the bird flu virus in February 2009 by Baxter] not been exposed by [the independent media and internet]the outcome could have been much different.

In order to gain voluntary compliance as well as gain support for enforced vaccination the next viral campaign will have to initially and very quickly claim a lot of victims and in a brutal manner so that the media can run graphic images of people coughing up blood and dying within hours of becoming infected.

I also fear that those who resist being vaccinated can and will be labeled 'terrorists' and will either disappear or be vaccinated by force. Under so-called anti terror provisions in force in Canada one can be jailed without being charged just for being suspected of being a terrorist. Already in the failed H1N1 vaccination campaign resisters were being labeled as a liability and danger to the remainder of society based on claims that they were negatively impacting herd immunity. In a situation where a lethal virus is spreading rapidly it will be easy to label vaccination hold outs as terrorists much in the same manner in which those infected with AIDS are being portrayed as killers when they infect others. It is also probable that holdouts will reveal themselves as activists and will be targeted."

Mail Online

NHS slashes services to meet costs of swine flu scare

Daily Mail, 6 May 2010, 08:43 BST
http://www.dailymail.co.uk/news/article-1273513/NHS-slashes-services-meet-costs-swine-flu-scare.html

The NHS is being forced to cut services because of the huge costs of the swine flu scare that proved unfounded.

A survey has found that as many as one in six health trusts may have to slash services - or already have done so - to recoup costs.

The cuts required to pay for swine flu preparations are on top of the cuts needed after the election as the NHS adjusts to a post-credit crunch world.

And, for the first time, it has emerged that the average cost of the swine flu scare to primary care trusts was £340,000 - enough to pay the salaries of 17 nurses.

The huge amounts were spent on setting up antiviral collection points, storing and distributing vaccines, staff vaccination sessions and advertising to encourage people to have the jab.

The news comes just a month after ministers revealed that up to £300million of taxpayers' money was wasted on swine flu jabs that were never needed.

The Government ordered 90million doses of a vaccine last year as panic over the illness gripped the country – but when the pandemic failed to materialise, it soon became clear the order was far too large.

At the height of the scare, the chief medical officer, Sir Liam Donaldson, said as many as 65,000 people could die from the disease. In fact, the toll has been less than 500 - a fraction of the number who died from ordinary flu.

The survey of 107 Primary Care Trusts in GP magazine - which submitted a Freedom of Information request - has laid bare the full cost to local health services.

Five out of 31 PCTs which gave full details to the magazine said they had made cuts or were considering them, while others said they had used contingency funds to meet costs. None of the PCTs would say where the axe would fall.

Dr Richard Vautrey, deputy chairman of the British Medical Association's GP Committee, said individual trusts should not have had to foot the bill.

'I think a pandemic should be seen as an exceptional circumstance and a PCT should be fully supported by central government,' he said.

'The whole nature of a national health service is that one area should be able to support another, and the unusual financial burden of this episode should be borne centrally.'

REUTERS

WHO panel to review H1N1 pandemic status in coming weeks

Reuters, 11 May 2010, 7:28 PM GMT+8
https://www.reuters.com/article/world/who-panel-to-review-h1n1-pandemic-status-in-coming-weeks-idUSJOE64A0G0/

GENEVA (Reuters) - An expert panel advising the World Health Organisation on pandemics will review the status of the H1N1 virus later this month or in early June to decide whether the swine flu pandemic is over.

The Emergency Committee is waiting for the onset of winter in the southern hemisphere before making its recommendation, spokesman Gregory Hartl said.

That meant the 15-member independent panel would probably meet at the end of May or in early June, after the WHO's governing World Health Assembly next week, he told a briefing.

"They have to look at the information that exists at that time on the activity of the H1N1 virus," Hartl said.

The WHO's guidance on whether a disease constitutes a pandemic determines how its 193 member governments handle an outbreak, including stockpiling vaccines and antivirals.

The United Nations body has been accused of exaggerating the dangers of the H1N1 outbreak, which was declared a full pandemic in June 2009 after dominating last year's health assembly.

The current virus appears to have been less severe than the two previous influenza pandemics in 1957 and 1968, which killed about 2 million and 1 million people respectively, with most victims suffering only mild symptoms.

Confirmed deaths from H1N1 since the outbreak emerged in April last year number at least 18,000, but it will be a few years before the real – much higher – figure is known.

John Mackenzie, who chairs the emergency committee and is the only one of its 15 members to have been publicly identified, said last month that the current pandemic was as severe as the two previous ones and remained a threat.

We're all outside and obviously, you know, the flames walked down and the house was just demolished in pieces.

Members' identities are kept secret to protect them from pressure from drugs companies or other interest groups.

Hartl said the committee was likely to have three options: conclude that the pandemic was still in force and retain the WHO's current phase 6 on its 6-level pandemic scale; state that the pandemic had moved into a transitional "post-peak" phase; or declare that the pandemic had passed.

Мировое везение: не так страшен оказался грипп

59.RU, 18 мая 2010, 11:13
https://59.ru/text/health/2010/05/18/55668671/

Миру однозначно повезло, что вирус гриппа A(H1N1) не мутировал в более смертоносную форму, а вакцина против болезни оказалась эффективной и безопасной. Об этом заявила генеральный директор Всемирной организации здравоохранения (ВОЗ) Маргарет Чен, выступая перед делегатами открывшейся 63-й сессии Всемирной ассамблеи здравоохранения. «Хорошие новости для общественного здоровья обычно связаны с такими факторами, как политическая решимость, достаточные средства, масштабные программы государственной поддержки», – сказала она, признав, что «иногда нам просто везет».

В случае с новым гриппом именно это и произошло, уверена Чен. «Вирус не мутировал в другую, более смертоносную форму. Вакцина эффективно противостояла ходившим вирусам и продемонстрировала отличные результаты в области безопасности», – подчеркнула она. Руководитель ВОЗ предупредила, что, «если бы ситуация развивалась по неправильному пути в одной из этих областей, у нас была бы сегодня совсем другая повестка дня».

Выступление Чен стало своеобразным ответом на раздающуюся в последние месяцы в мировой прессе критику, что ВОЗ создала панику относительно нового гриппа, что заставило многие страны закупить вакцины в объемах, намного превышающих реальную в них необходимость. Сам же новый грипп оказался менее смертоносным, чем эпидемия сезонного гриппа. Как ожидается, на ежегодной сессии представители 193 стран-членов ВОЗ обменяются мнениями о том, насколько правильными были ответные меры на новый грипп, унесший жизни около 18 тыс. человек.

Сессия Всемирной ассамблеи здравоохранения продлится до пятницы. В ее работе принимают участие несколько тысяч человек, включая около 60 министров здравоохранения.

South Africa acts on World Cup flu threat

Financial Times, 18 May 2010
https://www.ft.com/content/b01bcfda-61e2-11df-998c-00144feab49a

South Africa is taking extra precautions to prevent a flu outbreak at next month's World Cup, amid concern a surge in infections during the football tournament may spread the disease globally.

The government has now taken delivery of 3.5m doses of pandemic flu vaccine donated by pharmaceutical companies via the World Health Organisation, supplementing its purchases of seasonal flu vaccines to protect its own citizens.

With 400,000 supporters predicted to travel to South Africa for the 32-team competition – which takes place at the time of South Africa's traditional peak in seasonal flu cases – public health officials are watching closely for signs of any mutation in the virus and any accelerated spread back to fans' own countries.

Asked when the WHO might call a formal end of the current swine flu pandemic, Keiji Fukuda, special advisor to the agency's head, told the Financial Times: "The last big question is whether there will be anything unusual in the southern hemisphere" in the next few months, including in South Africa.

His comments came on the opening day of the World Health Assembly, the annual meeting of health ministers, where agency officials are bracing for fresh scrutiny of their actions a year after the formal announcement of swine flu as a pandemic, which triggered large-scale investment but few deaths from the disease.

Margaret Chan, head of the WHO, told delegates she welcomed the review of her actions now underway and said "we were plain lucky" that the virus had not proved more lethal. "Had things gone wrong . . . we would have a very different agenda before us today."

No measures to vaccinate travellers on arrival have been planned in South Africa, although a number of countries, including the UK and Canada, have urged fans planning to travel there to obtain injections, especially those with underlying health conditions.

THE FLU CASE

Is WHO going to stage another false pandemic during the world cup in South Africa?

The Flu Case, 18 May 2010, 11:12

https://web.archive.org/web/20100523171458/http://www.theflucase.com/index.php?option=com_content&view=article&id=3528%3Ais-who-going-to-stage-another-false-pandemic-during-the-world-cup-in-south-africa&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Dr Keiji Fukuda, WHO flu chief, told the Financial Times yesterday that WHO was continuing to keep the world on pandemic emergency level 6 because of concerns of a fresh outbreak of the swine flu virus during the World Cup in South Africa in June.

Under WHO's emergency level 6 pandemic declaration, people around the world can be forced to take a vaccine.

"The last big question is whether there will be anything unusual in the southern hemisphere" in the next few months, including in South Africa, Fukuda said.

The South African government has been given 3.5 million doses of pandemic flu vaccines by WHO, which got the jabs as donations from pharmaceutical companies.

WHO has been hyping the danger of an outbreak of pandemic virus during the World Cup for months, and warning that the football tournament may spread the pandemic globally.

The WHO must realise time for it to stage another false pandemic is running out.

Leading WHO officials were grilled on the opening day of the World Health Assembly, over their decision to declare a pandemic emergency level 6 over the mild swine flu, triggering lucrative contracts for pharmaceutical industry as well as laws that allow forced vaccination.

The World Cup is the ideal occasion for the WHO to declare it has found signs of any mutation in the virus and that these virus mutations have spread back to fans' own countries.

The world's mainstrea controlled media will be focussed on the football event and ready to hype any virus outbreak; as many as 400,000 fans could travel to South Africa for the competition, which takes place at the time of South Africa's traditional peak in seasonal flu cases, and WHO could use this to declare the virus has spread around the globe quickly.

WHO supplied Baxter with the bird flu virus that it used to contaminate 72 kilos of seasonal flu material in its Austrian facilities in Orth an der Donau, nearly triggerign a global bird flu pandemic in 2009 just weeks before the swine flu appeared in Mexico City.

WHO-affiliated Professor Bruno Lina is currently working in an Inserm lab in Lyon on finding a cross between a swine flu and bird flu virus.

The Washington Post

Frank Jordans

Expert panel to view confidential swine flu papers

The Washington Post // The Associated Press, 19 May 2010; 10:24 AM
https://web.archive.org/web/20100520032435/http://www.washingtonpost.com/wp-dyn/content/article/2010/05/19/AR2010051901783.html

GENEVA – An expert panel investigating the World Health Organization's response to last year's swine flu outbreak said Wednesday it wants to see confidential exchanges between the U.N. body and drug companies.

The 29-member panel will seek WHO records and correspondence from before and after the H1N1 strain was declared a pandemic in June, said committee chairman Harvey Fineberg, who is also president of the Institute of Medicine in Washington.

"We will want to have access to certain confidential documents that may be in place here at WHO or elsewhere," Fineberg told reporters in Geneva.

The documents include "contractual or letters of understanding" between the pharmaceutical industry and WHO, he said. "Some of the agreements with industry that we would like to examine have been considered confidential," but so far all of the panel's requests have been met, he said.

WHO spokesman Gregory Hartl said he couldn't immediately comment.

Under criticism for how the outbreak was handled, WHO Director-General Margaret Chan convened the panel last month and urged its members to conduct a "credible and independent review" that she promised would be transparent.

The Geneva-based agency has denied allegations that it gave pharmaceutical companies privileged access to national decision-makers.

Governments around the world spent millions of dollars (euros) buying antiviral drugs and flu vaccines in anticipation of a serious outbreak that never happened.

Among the companies that benefited was Switzerland's Roche Group, which saw sales of its Tamiflu antiviral medication jump by 2 billion Swiss francs ($1.74 billion) last year. British firm GlaxoSmithKline PLC sold both vaccines and its antiviral Relenza, while France's Sanofi-Aventis SA and U.S.-based Baxter International made vaccines. Some companies donated medicine to poor countries.

WHO has confirmed 18,036 deaths from the H1N1 strain over the past year - far fewer than would have died from seasonal flu during the same period.

Chan said this week at a meeting of WHO's 193 member states that the world had been "just plain lucky" that swine flu wasn't deadlier.

The panel's final report is expected to be finished next year, and will be made public, Fineberg said.

THE FLU CASE

WHO's Dr Chan says "there will be more" pandemics

The Flu Case, 25 May 2010 14:45

http://thefastertimes.com/globalpandemics/2010/05/22/who-takes-lessons-from-2009-h1n1-swine-flu-pandemic/

Global Pandemics
WHO Takes Lessons from 2009 H1N1 'Swine Flu' Pandemic
May 22, 2010 Onome Akpogheneta

The handling of the 2009 H1N1 pandemic was reviewed at the 63rd meeting of the World Health Assembly, which opened in Geneva on 17th May and closed on 21st May 2010.

"Sometimes… we are just plain lucky", considered Dr Margaret Chan, World Health Organization (WHO) Director-General, during her opening address to the Assembly. Chan was referring to the 2009 H1N1 'Swine Flu' pandemic. H1N1 was to be discussed during the Assembly, but Chan's opening remarks emphasized the major focus would be thorough assessment of Millennium Development Goal (MDG) progress. With the approach of the 2015 MDG finish line, "we need to move forward fast" urged Chan.

In relation to pandemics, Chan assured "there will be more". Clearly there are no reliable predictions about when we might expect new pandemic outbreaks, so lessons about the handling and management of the 2009 H1N1 'Swine Flu' pandemic should be learned soon. During the Assembly and beyond, the working group charged with reviewing H1N1 has and will continue to investigate the criticisms "levelled at WHO for its management of the pandemic" confirmed Chan.

The WHO Global Influenza Surveillance Network continues to monitor the progress of the 2009 H1N1 influenza pandemic today. Current reports of virus transmission are most frequent in parts of the Caribbean and Southeast Asia. There have now been at least 18,097 H1N1 deaths and the viral infection has been confirmed in 214 countries and overseas territories. However, estimates on the number of infections are no longer given. With Dr Chan's remarks, it seems that WHO clearly and publicly considers that the worst, or even moderate, fears about the 2009 H1N1 pandemic have not been, and will not be, recognized.

The pandemic influenza preparedness working group is open-ended. During the Assembly the group discussed a recent intergovernmental pandemic influenza meeting, which had been held between 10-12 May 2010. The group considered that meeting to have been "transparent, substantive, collaborative and an important foundation for future negotiation". During the Assembly the working group also discussed the increased global access and capacity for developing affordable vaccines and medicines for pandemic influenza. There were 2 resolutions passed in relation to pandemic influenza preparedness and keeping the working group activities open-ended. The first resolution was a request for continued support from the WHO Director-General for ongoing technical consultations and studies, the second was that the working group should report at the 64th World Health Assembly in May 2011.

In concluding remarks, Chan was enthusiastic about the overall achievements of the Assembly. She described the “spirit of collaboration and consensus-seeking”, “the real gift to public health” and the “solid and inspiring guidance” given by Assembly members in relation to the “challenging agenda” which the Assembly presented.

We are certainly fortunate not to have experienced a devastating influenza pandemic in 2009-10 and there is much to be learnt from the handling of the pandemic. In particular, that the risk of disease was largely ineffectively communicated to varied audiences, that fears of disease were disproportionate to available evidence about disease risk, and that the implementation of preventative interventions in the form of vaccines caused so much controversy are all serious causes for concern. These are some of the lessons which need to be learnt if future pandemics are to be handled better. Chan offered assurance that the 2009 H1N1 pandemic experience is one from which WHO and health officials globally can learn to do things better, and from which the WHO, she insisted, is “seeking lessons”. It will be a while before we can know whether the lessons learnt will mean that things are done better. As more pandemics are assured, lessons must be learnt with time to reflect and consolidate, in advance of future international public health emergencies which put those same lessons learnt on trial.

World Health Organization

Dr Margaret Chan

Director-General Statement
following the eighth meeting of the Emergency Committee

Geneva, WHO, 3 June 2010
https://www.who.int/news/item/03-06-2010-director-general-statement-following-the-eighth-meeting-of-the-emergency-committee

The Emergency Committee held its eighth meeting by teleconference on 1 June 2010.

A global update was provided to the Committee on the pandemic situation, including a particular focus on developments in Africa and the Southern Hemisphere. The most active areas of pandemic influenza virus transmission are currently in tropical areas, primarily in parts of the Caribbean and Southeast Asia. These areas are now experiencing a relatively low level of resurgence of cases after experiencing more intense activity during July 2009. In temperate zones of the Southern Hemisphere, countries are not reporting increases in influenza activity above epidemic thresholds, or unusually early influenza activity. Pandemic influenza activity across the African continent is low or sporadic; data from West Africa indicates that the active transmission of pandemic influenza virus has largely subsided after peaking during February and March 2010.

After extensive discussions and questions, the Committee expressed the unanimous view that from a global perspective while pandemic activity is continuing, the period of most intense pandemic activity appears likely to have passed for many parts of the world. Committee members stressed that it remains critical for countries to continue to maintain vigilance concerning the pandemic, including all necessary public health measures for disease control as well as influenza virus and disease surveillance.

Following the advice of the Emergency Committee, the Director-General determined that while the period of most intense pandemic activity has passed, pandemic disease is expected to continue to occur and that a further meeting of the Emergency Committee to reassess the epidemiological situation would be convened by mid July 2010, when information from the winter influenza season in the Southern Hemisphere will be available.

On a separate issue, the Director-General noted that the secretariat is following the practice of the Organization for public disclosure of the names of the Emergency Committee members to take place once the work of the Committee had been completed. The purpose of this practice is to protect the integrity and independence of the Members while doing this critical work - but also to ensure transparency by publicly providing the names of the members as well as information about any interest declared by them at the appropriate time. The Committee Members strongly concurred with this approach.

The Sydney Morning Herald

Swine flu death toll at 18,156 a year

The Sydney Morning Herald, 12 June 2010, 11.06 am
https://www.smh.com.au/world/swine-flu-death-toll-at-18156-a-year-20100612-y47o.html

The World Health Organisation said Friday that 18,156 people had died from swine flu, a year after the influenza was declared a pandemic.

The virus is now "globally less active," Gregory Haertl, a spokesman of the UN health agency told AFP, but he warned that children and pregnant women in particular should remain vigilant.

Haertl also said that the figures on swine flu are "without doubt underestimated. It will be probably several times more than that."

"It is difficult to say what is the exact number, we'll have it within two years" after the disappearance of the virus, he added.

The WHO has been defending its handling of the pandemic in recent weeks, with a top medical journal becoming the latest to challenge it earlier this month.

The British Medical Journal found that WHO guidelines on the use of antiviral drugs were prepared by experts who had received consulting fees from the top two manufacturers of these drugs, Roche and GlaxoSmithKline (GSK).

But the head of the WHO defended the agency, rejecting claims that its handling of the pandemic was marred by commercial interests.

"At no time, not for one second, did commercial interests enter my decision-making," said Margaret Chan, WHO director-general, in a letter sent to the British Medical Journal, following the publication's article.

Centers for Disease Control and Prevention
CDC 24/7: Saving Lives. Protecting People.™

The 2009 H1N1 Pandemic: Summary Highlights, April 2009-April 2010

CDC, 16 June 2010
https://www.cdc.gov/h1n1flu/cdcresponse.htm

This document summarizes key events of the 2009 H1N1 pandemic and CDC's response activities for historical purposes. This document is a summary; it is not a comprehensive account of all CDC actions and activities nor is it intended to represent response efforts by other agencies and partners.

Pandemic Preparedness, Background

The 2009 H1N1 influenza (flu) pandemic occurred against a backdrop of pandemic response planning at all levels of government including years of developing, refining and regularly exercising response plans at the international, federal, state, local, and community levels. At the time, experts believed that avian influenza A (H5N1) viruses posed the greatest pandemic threat. H5N1 viruses were endemic in poultry in parts of the world and were infecting people sporadically, often with deadly results. Given that reality, pandemic preparedness efforts were largely based on a scenario of severe human illness caused by an H5N1 virus. Despite differences in planning scenarios and the actual 2009 H1N1 pandemic, many of the systems established through pandemic planning were used and useful for the 2009 H1N1 pandemic response.

CDC's response to the 2009 H1N1 pandemic response was complex, multi-faceted and long-term, lasting more than a year. This document seeks to document for the public the key events of the pandemic as they unfolded and CDC's response. The following is a summary narrative of highlighted CDC-related events from the 2009 H1N1 pandemic.

A Virus Emerges

2009 H1N1 was first detected in the United States in April 2009. This virus was a unique combination of influenza virus genes never previously identified in either animals or people. The virus genes were a combination of genes most closely related to North American swine-lineage H1N1 and Eurasian lineage swine-origin H1N1 influenza viruses. Because of this, initial reports referred to the virus as a swine origin influenza virus. However, investigations of initial human cases did not identify exposures to pigs and quickly it became apparent that this new virus was circulating among humans and not among U.S. pig herds.

Infection with this new influenza A virus (then referred to as 'swine origin influenza A virus') was first detected in a 10-year-old patient in California on April 15, 2009, who was tested for influenza as part of a clinical study. Laboratory testing at CDC confirmed that this virus was new to humans. Two days later, CDC laboratory testing confirmed a second infection with this virus in another patient, an 8-year-old living in California about 130 miles away from the first patient who was tested as part of an influenza surveillance project. There was no known connection between the two patients.

Laboratory analysis at CDC determined that the viruses obtained from these two patients were very similar to each other, and different from any other influenza viruses previously seen either in humans or animals. Testing showed that these two viruses were resistant to the two antiviral drugs amantadine and rimantadine, but susceptible to the antiviral drugs oseltamivir and zanamivir. CDC began an immediate investigation into the situation in coordination with state and local animal and human health officials in California.

The cases of 2009 H1N1 flu in California occurred in the context of sporadic reports of human infection with North American-lineage swine influenza viruses in the United States, most often associated with close contact with infected pigs. (During December 2005 – January 2009, 12 cases of human infection with swine influenza were reported; five of these 12 cases occurred in patients who had direct exposure to pigs, six patients reported being near pigs, and the source of infection in one case was unknown). Human-to-human spread swine influenza viruses had been rarely documented and had not been known to result in widespread community outbreaks among people. In mid-April of 2009, however, the detection of two patients infected with swine origin flu viruses 130 miles apart, raised concern that a novel swine-origin influenza virus had made its way into the human population and was spreading among people.

CDC remained in close contact with the international health community as the outbreak unfolded and on **April 18, 2009**, under the International Health Regulations (IHR) the United States International Health Regulations Program reported the 2009 H1N1 influenza cases to the World Health Organization (WHO). The cases also were reported to the Pan American Health Organization (PAHO), Canada and Mexico, as part of the Security and Prosperity Partnership of North America.

Response Ramps Up

CDC worked closely with state and local animal and human health officials on epidemiological investigations by tracing contacts of both patients to try to determine the source of their infection and by examining whether there was any link between the patients and pigs. Surveillance also was enhanced to try to detect additional cases of human illness with this virus. Based on the geographic location of the first cases, lack of contact between these cases and swine, and data collected through contact tracing and laboratory testing, CDC epidemiologists suspected that human-to-human transmission of this virus had taken place. In an article entitled Swine Influenza A (H1N1) Infection in Two Children --- Southern California, March-April 2009 published on April 21, 2009 in the Morbidity and Mortality Weekly Report (MMWR), CDC described the cases and requested that state public health laboratories send to CDC all influenza A specimens that could not be subtyped. That same day CDC responded to media inquiries related to the MMWR from medical reporters. Within a day, three additional samples of this new virus were identified in San Diego County and Imperial County California hospitals and sent to CDC for further testing. CDC laboratory testing confirmed that these samples also were positive for the virus that would come to be called “2009 H1N1.”

By **April 21, 2009**, CDC had begun working to develop a virus that could be used to make vaccine to protect against this new virus (called a candidate vaccine virus). There are many steps involved with producing a vaccine – the first step is getting a good high yield vaccine virus. A high-yield vaccine virus is a sample of the virus that is used to grow the virus in mass quantities in chicken eggs. Once the virus is grown in mass quantities, the virus particles are then purified to make vaccine. Recognizing that 2009 H1N1 was a new flu virus – and, like all flu viruses, unpredictable – CDC simultaneously pursued multiple scientific methods to create a high-yield virus. A virus isolated at CDC, (called A/California/07/2009) was eventually chosen to be the vaccine virus used to make vaccine. CDC sent the vaccine virus to vaccine manufacturing companies so that they could begin vaccine production, in the event that the U.S. government should decide a vaccine was necessary.

CDC activated its Emergency Operations Center (EOC) on April 22, 2009, to coordinate the response to this emerging public health threat. Response activities were organized into a team structure according to the National Incident Management System (NIMS) These teams had different areas of focus including but not limited to: surveillance, laboratory issues, communications, at-risk populations, antiviral medications, vaccine, and traveler’s health issues. As the outbreak unfolded, team structures and staffing were periodically assessed for functionality and utility.

On April 23, 2009, samples submitted by Texas revealed two additional cases of human infections with 2009 H1N1, transforming the investigation into a multistate outbreak and response. At the same time, CDC was testing 14 samples from Mexico, some of which had been collected from patients who were ill before the first 2 U.S. (California) patients. Results from seven of the samples were

positive for 2009 H1N1 and similar findings were reported for specimens submitted by Mexico to Canada. It had now become clear that cases were occurring in multiple countries and human to human spread of the virus appeared to be ongoing. That same day CDC held the first formal full press briefing to inform the media and guide the public and health care response to the rapidly evolving situation. CDC held nearly 60 press briefings during the 2009 H1N1 response.

On April 24, 2009, CDC uploaded complete gene sequences of the 2009 H1N1 virus to a publicly-accessible international influenza database, which enabled scientists around the world to use the sequences for public health research and for comparison against influenza viruses collected elsewhere, and an updated report on the outbreak was published online in the MMWR.

World Braces for Possible Pandemic

On Saturday, **April 25, 2009**, under the rules of the International Health Regulations, the Director-General of WHO declared the 2009 H1N1 outbreak a Public Health Emergency of International Concern and recommended that countries intensify surveillance for unusual outbreaks of influenza-like illness and severe pneumonia. Also on April 25, 2009, New York City officials reported an investigation into a cluster of influenza-like illness in a high school, and CDC testing confirmed two cases of 2009 H1N1 influenza infection in Kansas, and another case in Ohio shortly after.

On April 26, 2009, the United States Government determined that a public health emergency existed nationwide; CDC's Strategic National Stockpile (SNS) began releasing 25% of the supplies in the stockpile that could be used to protect and treat influenza. This included 11 million regimens of antiviral drugs, and personal protective equipment including over 39 million respiratory protection devices (masks and respirators), gowns, gloves and face shields, to states (allocations were based on each state's population).

As part of the nation's pre-pandemic planning efforts, by April 2009 the Federal Government had purchased 50 million treatment courses of antiviral drugs – oseltamivir and zanamivir – for the SNS, and states had purchased 23 million antiviral regimens. After the determination of the public health emergency, FDA also took action to expand possible usage of antiviral drugs oseltamivir and zanamivir by issuing Emergency Use Authorizations (EUAs).

The EUAs allowed for use of the products in a manner different from what they were FDA-approved for. This included allowing for off-label use of:

- oseltamivir to treat children younger than 1 year of age and to help prevent influenza in children 3 months to 1 year of age, and;
- oseltamivir and zanamivir to treat patients who are symptomatic for more than two days before initiation of treatment, or who had complicated illness requiring hospitalization.

On April 27, the WHO Director-General raised the level of influenza pandemic alert from phase 3 to phase 4 , based primarily on epidemiological data demonstrating human-to-human transmission and the ability of the virus to cause community-level outbreaks. Based on reports of widespread influenza-like-illness and many severe illnesses and deaths in Mexico, CDC issued a travel health warning recommending that United States travelers postpone all non-essential travel to Mexico. As in past influenza seasons, CDC urged the public and especially those people at highest risk of influenza-related complications, to protect themselves by taking antiviral drugs early in their illness when recommended by their doctor; CDC also advised that everyone take every day preventive actions like covering coughs and sneezes and staying home from work and school when ill to help reduce the spread of illness.

On April 29, 2009 WO raised the influenza pandemic alert from phase 4 to phase 5 , signaling that a pandemic was imminent, and requested that all countries immediately activate their pandemic preparedness plans and be on high alert for unusual outbreaks of influenza-like illness and severe pneumonia. The U.S. Government was already implementing its pandemic response plan. CDC continued to post and update guidance for states, clinicians, laboratories, schools, partners and the public on topics ranging from the non-pharmaceutical measures communities could take to limit

spread of disease, to how to evaluate a patient for possible infection with 2009 H1N1 influenza, to how to care for children who might be sick with 2009 H1N1 influenza.

On April 30, 2009, CDC issued an MMWR Dispatch describing the initial outbreak of 2009 H1N1 influenza in Mexico. Findings in Mexico indicated that transmission in Mexico involved person-to-person spread with multiple generations of transmission. CDC also issued an MMWR Dispatch on the outbreak of 2009 H1N1 influenza infection in a high school in New York City, that was, at the time, the largest reported cluster of 2009 H1N1 cases in the United States. The Dispatch suggested that the high school age students had respiratory and fever symptoms similar to those caused by a seasonal flu, but in addition, about half had diarrhea, which is more than expected with seasonal flu. As the details of the outbreak unfolded, the Federal response continued in high gear. Also on April 30, 2009, HHS announced that the Federal government would purchase an additional 13 million treatment courses of antiviral drugs to help fight influenza . The additional treatment courses would be added to the SNS.

As the outbreak spread, CDC began receiving reports of school closures and implementation of community-level social distancing measures meant to slow the spread of disease. School administrators and public health officials were following their pandemic plans and doing everything they could to slow the spread of illness. (Social distancing measures are meant to increase distance between people. Measures include staying home when ill unless to seek medical care, avoiding large gatherings, telecommuting, and implementing school closures).

CDC Laboratories Bolster Nation's Testing Capacity

While initial efforts were underway to develop a safe and effective vaccine to protect people against 2009 H1N1, work also was being done at CDC to help laboratories supporting health care professionals to more quickly identify the 2009 H1N1 virus in samples from patients. The real-time PCR test developed by CDC was cleared for use by diagnostic laboratories by FDA under an Emergency Use Authorization (EUA) on April 28, 2009, less than two weeks after identification of the new pandemic virus. Prior to the availability of this EUA, public health laboratories had been able to identify whether influenza A viruses were seasonal influenza viruses or were a novel strain, but the new diagnostic kits allowed labs to confirm a virus as 2009 H1N1. On May 1, 2009, CDC test kits began shipping to domestic and international public health laboratories. (Each test kit contained reagents to test 1,000 clinical specimens). From May 1 through September 1, 2009, more than 1,000 kits were shipped to 120 domestic and 250 international laboratories in 140 countries. Once labs had the test kits and verified that their testing was running properly, they were able to identify new cases more quickly than before and no longer needed to send samples to CDC for lab confirmation. The transition away from CDC lab confirmation testing didn't happen overnight though - between April 23 and May 31, 2009, CDC influenza laboratory analyzed about 5,000 influenza virus samples, five times the number that were processed in a similar timeframe in 2008, and more than during any previous influenza season. By May 18, 2009, 40 states had been validated to conduct their own 2009 H1N1 testing, with eight states having multiple laboratories able to do their own testing. CDC alerted the public that the expansion in testing capacity would likely result in a jump in the number of 2009 H1N1 cases, but that this would actually present a more accurate picture of the true scope of 2009 H1N1 influenza in the United States.

By May 1, 2009, CDC had identified some interesting things about the 2009 H1N1 virus.

- Researchers had confirmed earlier testing that the 2009 H1N1 influenza virus was a quadruple-reassortant virus, meaning that it contained virus genes that originated from four different influenza virus sources. Some of the gene segments originated from North American swine influenza viruses, some gene segments originated from North American avian influenza viruses, one gene segment originated from a human influenza virus, and two gene segments were normally found in swine influenza viruses from Asia and in Europe.
- Testing of a number of the virus samples submitted to CDC showed that they were very similar, which means they likely originated from the same source.

- Laboratory testing showed that the 2009 H1N1 influenza virus did not have any 1918-like markers that had been associated with increased risk of severe disease.
- Testing also did not find genetic markers that were previously associated with high death rates in people infected with the avian influenza A (H5N1) virus in other countries.

On May 4, 2009, CDC shifted from reporting confirmed cases of 2009 H1N1 to reporting both confirmed and probable cases of 2009 H1N1. At that point, more than 98% of "probable" flu virus samples were testing positive for 2009 H1N1, indicating the ever-growing scale of the outbreak. Probable cases were reported to CDC by state health departments and occurred in people who tested positive for influenza A and negative for seasonal influenza A(H1N1) and A(H3N2) subtypes at their state health department laboratory, but whose samples had not had confirmatory testing for the 2009 H1N1 influenza virus.

CDC Shares Personnel, Guidance, Early Results of Studies

CDC deployed a large number of staff to the field to support the outbreak response; by May 1, 2009, 50 staff people were deployed, and that number climbed to more than 100 by May 11, 2009, before gradually declining as field teams returned from deployment to complete studies, analyze collected data, and help inform policy decisions for the prevention and control of 2009 H1N1 influenza. Over the course of the outbreak, more than 3,300 people from throughout CDC would support the response.

On May 6, 2009, CDC distributed recommendations for the use of influenza antiviral medicines to provide guidance for clinicians in prescribing antiviral medicines for treatment and prevention (chemoprophylaxis) of 2009 H1N1 influenza. CDC recommended that testing and antiviral treatment be prioritized for people with severe respiratory illness and people at high risk of complications from seasonal influenza. This included children younger than 5 years old, pregnant women, people with chronic medical conditions, and people 65 years and older.

On May 8, 2009, CDC issued an MMWR updating the situations in Mexico, the United States, and worldwide, and on May 15, 2009, CDC's Travel Health Warning recommending against non-essential travel to Mexico, in effect since April 27, 2009, was downgraded to a Travel Health Precaution for Mexico.

By this point in the outbreak, about half of all influenza viruses being detected through laboratory surveillance were 2009 H1N1 viruses, with the other half being regular seasonal influenza viruses, including seasonal influenza A H1N1, influenza A H3N2 and type B viruses. Surveillance reports indicated that the largest number of 2009 H1N1 influenza confirmed and probable cases (about 57% of cases) were occurring among people between 5 years and 24 years of age, and 41% of the hospitalizations were occurring among older children and young adults. The highest rates of hospitalization were among children younger than 5 years of age; the next highest hospitalization rate was in people 5 years to 24 years of age. Based on data from previous influenza pandemics and seasonal influenza, pregnant women had been recognized as a high-risk group early in the outbreak. Early data on 2009 H1N1 illness among pregnant women was reported in an article published as an MMWR Dispatch on May 12, 2009. This article emphasized the importance of empiric treatment (treatment without confirmatory testing) of pregnant women suspected to have 2009 H1N1. People with other previously recognized medical conditions that placed them at high risk of complications from seasonal influenza also appeared to be at increased risk of complications from 2009 H1N1 influenza. In this report, seventy-one percent (71%) of hospitalized patients had one or more underlying chronic medical conditions. Reported deaths had occurred in people ranging in age from 22 months old to 57 years old. Also, only 13% of hospitalizations had occurred in people 50 years and older, and there were few cases and no deaths in people older than 65 years, which was unusual when compared with seasonal flu.

Early results of an antibody study conducted by CDC indicated that children had no existing cross-reactive antibody to the 2009 H1N1 influenza virus, while about one-third of adults older than 60

years of age had cross-reactive antibody against the 2009 H1N1 flu virus. One possible explanation for this pre-existing antibody in older adults was that they may have had previous exposure, either through infection or vaccination, to an influenza A H1N1 virus that was more closely related to the 2009 H1N1 flu virus than contemporary seasonal influenza A (H1N1) viruses are. Data from a similar study suggested that seasonal influenza vaccine would not provide any significant protection against 2009 H1N1 influenza virus.

A Pandemic is Declared

On June 11, 2009, WHO signaled that a global pandemic of 2009 H1N1 influenza was underway by further raising the worldwide pandemic alert level to Phase 6 . That day, CDC held its first press conference with the new CDC Director Thomas Frieden, MD, MPH. The press conference had a total of 2,355 participants. At the time, more than 70 countries had reported cases of 2009 H1N1 infection, and community level outbreaks of 2009 H1N1 were ongoing in multiple parts of the world. The WHO decision to raise the pandemic alert level to Phase 6 was a reflection of spread of the virus in other parts of the world and not a reflection of any change in the 2009 H1N1 influenza virus or associated illness. To date, most people in the United States who had become ill with 2009 H1N1 influenza had not become seriously ill and had recovered without hospitalization.

After the WHO declaration of a pandemic on June 11, the 2009 H1N1 virus continued to spread and the number of countries reporting cases of 2009 H1N1 nearly doubled from mid-June 2009 to early July 2009. Significant levels of 2009 H1N1 illness continued, with localized and in some cases intense outbreaks occurring. By June 19, 2009, all 50 states in the United States, the District of Columbia, Puerto Rico, and the U.S. Virgin Islands had reported cases of 2009 H1N1 infection. The United States continued to report the largest number of 2009 H1N1 cases of any country worldwide, although most people who became ill recovered without requiring medical treatment. By late June more than 30 summer camps in the U.S. had reported outbreaks of 2009 H1N1 influenza illness, and CDC released guidance for day and residential camps to reduce the spread of influenza. At the June 25, 2009 Advisory Committee on Immunization Practices Meeting , CDC estimated that at least 1 million cases of 2009 H1N1 influenza had occurred in the United States.

In early July, 2009, three 2009 H1N1 influenza viruses that were resistant to the antiviral drug oseltamivir were detected in three countries. (Antiviral resistance is when a virus changes in such a way that the antiviral drug is less effective in treating or preventing illnesses caused by the virus.) CDC and WHO partners continued to conduct surveillance for antiviral resistance, although instances of antiviral resistance continued to be detected very rarely.

Also **in July 2009**, CDC reported findings in the MMWR that indicated a striking prevalence of obesity in intensive care patients who were confirmed to have 2009 H1N1 influenza. Throughout the pandemic, CDC would continue to examine the relationship between 2009 H1N1 influenza, obesity, severe disease and other underlying risk factors.

CDC continued to work with the Council of State and Territorial Epidemiologists (CSTE) to enhance surveillance for 2009 H1N1 influenza. As 2009 H1N1 cases continued to occur through the spring and summer, the task of counting cases became increasingly difficult. On May 12, 2009, CDC transitioned from reporting individual confirmed and probable cases of 2009 H1N1 influenza to reporting aggregate counts of 2009 H1N1 lab confirmed and probable cases, hospitalizations and deaths with the launch of an aggregate reporting web site. Once the numbers of cases increased beyond the point where counting of individual cases was practical, on July 23, 2009, CDC reported the number of 2009 cases for the last time. Reporting of 2009 H1N1 hospitalizations and deaths continued. In addition, CDC continued using its traditional surveillance systems to track the progress of the 2009 H1N1 influenza outbreak. Traditional surveillance systems do not count individual cases, but instead monitor activity levels and virus characteristics through a nationwide surveillance system.

CDC worked closely with countries in the Southern Hemisphere to monitor and enhance surveillance for influenza viruses throughout the summer months. The Southern Hemisphere's

influenza season began in May 2009 and countries there reported that 2009 H1N1 virus was spreading and causing illness along with regular seasonal influenza viruses. After mid-July , disease activity in most countries decreased, and by November, temperate regions of the Southern Hemisphere were reporting very little 2009 H1N1 disease activity. In general, the experience of the Southern Hemisphere with the 2009 H1N1 virus was similar to what is usually seen during a regular influenza season and did not seem to excessively impact the health care systems in the Southern Hemisphere. Also, surveillance systems did not find significant changes in the 2009 H1N1 influenza viruses circulating in the Southern Hemisphere as compared to viruses isolated from people in the Northern Hemisphere. These findings provided the U.S. with valuable clues related to what the 2009-2010 influenza season in the United States might be like. Importantly, the lack of significant changes in the virus indicated that the 2009 H1N1 vaccine being manufactured would closely match the currently circulating 2009 H1N1 viruses and likely provide people with good protection against 2009 H1N1 influenza.

Ongoing Surveillance & Response

2009 H1N1 influenza summer activity peaked in the United States during May and June and declined during July and early August. However, levels of influenza activity would remain above normal throughout the summer months with localized outbreaks. During the last two weeks of August, 2009 H1N1 influenza activity again began to increase United States.

In **August 2009,** CDC reported an additional two instances of oseltamivir-resistant virus infection in two immunosuppressed patients in Seattle, Washington. Later, in mid-September, CDC reported two additional cases of oseltamivir-resistant 2009 H1N1 influenza in two summer campers in North Carolina. CDC and partners continued to carefully track 2009 H1N1 influenza antiviral resistance. As of June 2010 the 2009 H1N1 virus remains susceptible to the antiviral drugs oseltamivir and zanamivir, with rare exception. Cases of antiviral resistance are carefully tracked and updated numbers are posted each week as part of the CDC publication FluView.

In late August, CDC began working with the commercial supply chain (manufacturers, distributors, retailers) for certain influenza countermeasures to monitor national inventory levels of critical supplies (antivirals and respiratory protective equipment) on a weekly basis. This visibility provided important data to guide SNS decision-making leading to the release of additional SNS countermeasures.

FDA and the manufacturer of the antiviral drug Tamiflu® (oseltamivir) recognized that commercial and stockpiled supplies of Tamiflu® oral suspension (liquid formulation meant for children) were limited in October 2009. CDC worked with partners to reach pharmacists with background information, updates on antiviral drug supplies, and instructions on how to compound oral suspension from Tamiflu® capsules meant for adults (Compounding is the mixing of drugs by a health care professional to fit the unique needs of the patient). CDC also provided instructions for parents and caregivers on how to make a medicine mixture for their child using adult Tamiflu® capsules and thick, sweetened liquid. CDC also analyzed related surveillance data and based on the analysis over 500,000 bottles of pediatric oral suspension were distributed from the CDC SNS to states to fill production gaps and meet the increasing demand for the formulation.

On **October 23rd, 2009**, FDA issued an Emergency Use Authorization (EUA) for Peramivir IV. Peramivir IV is an investigational intravenous antiviral drug used to treat people who have been hospitalized due to severe flu illness. This drug was held in the Strategic National Stockpile (SNS) and distributed by CDC under an EUA. Licensed clinicians were able to request this product through the CDC website electronic request system, and product was delivered directly to hospital facilities. Also in October, HHS authorized the release of an additional 59.5 million N95 respirators.

CDC closed out reports of 2009 H1N1 hospitalizations and deaths for the 2008-09 season in late August. On August 30, 2009, reporting modifications were implemented to allow states to report hospitalizations and deaths associated with any influenza or to report hospitalizations and deaths using a pneumonia and influenza syndromic case definition through the Aggregate Hospitalizations and Deaths Reporting Activity (AHDRA). This change in reporting was implemented in order to

provide a fuller picture of the burden of serious flu illness and deaths during the pandemic. The new reporting season for the 2009-2010 flu season began on August 30, 2009, and the first new numbers for the 2009-2010 season were reported in the September 11, 2009 issue of FluView.

Over the course of the pandemic, CDC refined and revised its surveillance methods, eventually developing a methodology based on surveillance data to estimate the range of 2009 H1N1 cases, hospitalizations and deaths in the United States. CDC released its first official estimates for 2009 H1N1 cases, hospitalizations and deaths on November 12, 2009, and updated these on December 10, 2009, January 15, 2010, February 12, 2010, March 12, 2010, April 19, 2010 and for the final time on May 14, 2010.

2009 H1N1 Vaccination

The emergence and spread of the 2009 H1N1 virus resulted in extraordinary influenza-like illness activity in the United States throughout the summer and fall months of 2009. During this period, influenza activity reached its highest level in the reporting week ending October 24, 2009, with 49 of 50 states reporting geographically widespread disease. A cornerstone of the U.S. Government response to the 2009 H1N1 pandemic was the launch of the national influenza 2009 H1N1 vaccination campaign that began in October.

...

On February 18, 2010, the World Health Organization (WHO) published recommendations for the composition of influenza virus vaccines for the upcoming season in the Northern Hemisphere (November 2010-April 2011). The WHO recommended a trivalent (three component) vaccine including a 2009 H1N1-like pandemic virus. In February of 2010, the components of the 2010-2011 influenza vaccine were announced. The 2010-2011 flu vaccine will protect against a 2009 H1N1-like virus in addition to an influenza A H3N2 virus and an influenza B virus.

The United States experienced its second wave of 2009 H1N1 activity in the fall with activity peaking during the second week in October. After that, activity declined quickly to below baseline levels in January, but persisted for several more months at lower levels. However, by May, influenza activity levels in the United States were low across key flu indicators. Reporting for the 2009-2010 influenza season was finalized on May 28, 2010. Even as flu activity reached normal summer-time levels in the U.S., CDC continued to recommend influenza vaccination, particularly for high risk persons, because of reports of ongoing sporadic cases of 2009 H1N1, ongoing spread of 2009 H1N1 in the Southern Hemisphere and the possibility that 2009 H1N1 viruses might circulate early during the upcoming flu season.

CDC Communication Activities During the 2009 H1N1 Pandemic

The CDC response to the 2009 H1N1 pandemic was led by science and continually evolved to meet the nation's needs as events unfolded and as more information became available. However, a consistent underlying communications strategy underscored the entire CDC response. The strategy is based on the emergency risk communications principles of quickly, proactively and transparently communicating accurate information to the public and to partners. This strategy included CDC clearly stating its goals and actions in response to the evolving situation and acknowledging what was not known, as well as what was known. Another important part of the strategy was CDC setting the expectation that information and advice would change rapidly as the situation evolved. From the earliest days of the pandemic, CDC regularly articulated its goals to "reduce transmission and illness severity, and provide information to help health care providers, public health officials and the public address the challenges posed by the new virus." Throughout the response, in an effort to provide the most helpful information in the most effective ways possible, CDC drew on existing knowledge but also worked with partners to conduct ongoing scientific research and evaluation of people's knowledge, attitudes and practices related to a number of topics including 2009 H1N1 flu, infection control guidance, and vaccine.

Especially during the early days of the outbreak, the release of information from CDC and exchange of information with partners was conducted on a 24-hour cycle. This included frequent updates to media and the public, the consistent use of a core group of spokespersons, daily information outreach to partners, and rapid establishment and ongoing maintenance of an extensive Web site dedicated specifically to the emergency response for 2009 H1N1 flu. The goal was not only to be as transparent as possible in all activities related to managing the public health response, but also to maintain credibility and continue to be a trusted source of information for the public and for partners.

Beginning early in the response and continuing throughout the year and into 2010, special care was taken to keep state and local public health partners informed of CDC's activities. Key messages were regularly provided to help maintain consistent, clear communication across the response. Special care also was taken to regularly collect feedback from state and local public health partners to help ensure that CDC recommendations were finely tuned to what was happening in the field. Regularly scheduled conference calls with the Association of State and Territorial Health Officials, the National Association of City and County Health Officials, and the National Public Health Information Coalition proved to be an effective way to share information. In addition, on April 24, 2009, CDC held the first of more than 30 Clinician Outreach and Communication Activity (COCA) calls presented on a variety of 2009 H1N1-related topics. COCA is designed to reach a diverse group of health care providers and provide a system through which clinicians can communicate their educational needs to CDC and receive answers to questions about related emerging diseases. At the peak of the 2009 H1N1 response, COCA had more than 41,100 listserv subscribers.

CDC also worked hard to keep the policy community informed. CDC provided responses to congressional requests for information and briefings on 2009 H1N1-related issues, and also provided email and web-based informational updates as the pandemic unfolded. In all, CDC participated in 14 hearings, provided technical assistance in another 12 hearings, issued over three dozen 2009 H1N1 newsletters to policymakers, arranged for over 40 congressional briefings or speaking engagements and fielded over 350 congressional inquiries during the pandemic.

There was a concerted effort to get information out as soon as possible and to keep the public and partners aware of developments as they unfolded, even as guidance was changing quickly. For example, when relatively few cases of human infection with this virus were lab confirmed and severity of the pandemic was not known, on April 28, 2009, CDC posted guidance for schools and advised that they close if they had a suspected or actual case of the flu in order to lessen the risk of spreading 2009 H1N1 into their communities. As more information became available suggesting a lower risk of severe illness and death from 2009 H1N1, six days later the recommendation was changed to recommend against school closure for community mitigation purposes.

The development of CDC guidance is an example of the collaborative communication and sharing of information that took place between CDC, HHS, other federal agencies, and external partners. Development of appropriate guidance often relied on CDC communication with many external partners several times a week, with the goal of achieving consensus on what the best practice would be given the best science currently available. For example, CDC worked with representatives from a number of organizations including but not limited to

Council of State and Territorial Epidemiologists (CSTE), National Association of County and City Health Officials (NAACHO), American Academy of Pediatrics (AAP), American Academy of Family Physicians (AAFP), American College of Obstetricians and Gynecologists (ACOG), Association of State and Territorial Health Officials (ASTHO), American College of Physicians (ACP), Infectious Diseases Society of America (ISDA), American Academy of Pediatrics (AAP), Food and Drug Administration (FDA) and World Health Organization (WHO), during the development of guidance related to everything from surveillance systems to the appropriate use of antiviral drugs during the pandemic. On the topic of vaccination, these discussions helped inform decision-making by the Advisory Committee on Immunization Practices (ACIP).

Apart from ongoing collaboration between CDC and its external partners, the communications response for 2009 H1N1 flu also was characterized by ongoing, close coordination between CDC's communicators and its scientists to ensure that messages stayed scientifically accurate. Also, CDC communicators took time to regularly analyze feedback from a variety of external sources, including polls and surveys, in order to ensure that CDC's messages were clear.

CDC provided a steady stream of information to audiences across the spectrum: from the public to pharmacists to laboratorians to international partners and countries around the globe. Information provided by CDC reached a myriad of audiences through a variety of channels including but not limited to: a 24-hour information hotline, press briefings for the media, dissemination through health alert networks, daily postings (including video and audio podcasts) to the CDC 2009 H1N1 web site, regular updates on Facebook and Twitter, and further outreach by partners and partner organizations to their own audiences, just to name a few channels. For example, in November 2009, CDC kicked off a national travelers' health public awareness campaign and urged travelers to plan ahead and stay informed about what to do if they got sick while they were away from home. The campaign used a variety of media, including informational posters distributed at over 300 ports of entry in the United States, national radio and print advertising, and social media and online outreach, which culminated in over 80 million exposures. CDC also coordinated with HHS and the Flu.gov web site and posted communication toolkits for the 2009-2010 influenza season for businesses, employers, childcare groups and institutions of higher education.

The CDC 2009 H1N1 influenza and seasonal influenza vaccination campaign was made up of multiple outreach efforts including placement of articles geared to numerous audiences like parents and young adults, in high-profile media outlets. Article placements led to nearly 403 million overall impressions. Other national outreach efforts made via social media tools, radio ads, two television public service announcements (PSAs), online media banners, and city bus ads. Numerous print materials in multiple languages were made for partners to distribute and were downloaded tens of thousands of times. Special audiences identified for additional print materials included Native Americans, African Americans, Hispanics, pregnant women, young adults, first responders, and health care workers.

In addition to materials provided for the 2009 H1N1 and seasonal influenza vaccination campaign, CDC provided other key materials in multiple languages. For example, the entire English-language 2009 H1N1 web site was mirrored in Spanish. In addition, key tools and resources were created in Chinese, Vietnamese, Korean, French, German, Arabic, Russian, Amharic, Farsi, Somali, Karen, Burmese, Cambodian, and Kirundi.

In all, between April 2009 when 2009 H1N1 flu first emerged and April 2010, CDC held 60 related media events – 39 press briefings and 22 telebriefings – for a total of more than 35,000 participants. CDC also hosted its first ever two-day workshop for the news media on the subjects of both 2009 H1N1 influenza and seasonal influenza in late August. Originally conceived to include 12 members of the news media, the attendance grew to over 40 journalists from national, regional and local news outlets representing radio, television, newspapers, magazines, and online news media. Speakers at the event included the Secretary of Health and Human Services, the CDC Director, influenza experts, vaccine safety experts, and laboratory experts. The CDC hotline (1-800-CDC-INFO) responded to more than 211,000 related inquiries from the general public and health care providers, and the CDC 2009 H1N1 web site had more than 219,595,000 page views. Also, the number of CDC Facebook fans rose to more than 55,000 fans and the CDC emergency profile on Twitter was tracked by more than 1,200,000 followers.

KING'S College LONDON

Public 'reassured' by swine flu media coverage

King's College London, 20 July 2010
https://www.kcl.ac.uk/archive/news/ioppn/records/2010/07july/publicreassuredbyswineflumediacoverage

Advertising and media coverage about swine flu *reduced public concern* and improved the uptake of useful, protective behaviours such as hand-washing, according to new research by King's College London and University College London (UCL).

The research, funded by the Department of Health's National Institute for Health Research, is published today in the journal *Health Technology Assessment.* The study looked at data from 36 telephone surveys with over 38,000 respondents which examined public attitudes to swine flu over the time course of the pandemic. The surveys were conducted at weekly intervals across the UK between 1 May 2009 and 10 January 2010 and examined how the public reacted throughout the pandemic and the reasons behind their behaviour.

The authors found that the public generally showed low levels of behaviour change. For example, only a third of people were carrying tissues as recommended at the time by the government. Only 56 per cent of the general public said they would have the swine flu vaccine if offered it. However, those people who were exposed to media reporting or advertising about swine flu were more likely to engage in helpful, protective behaviours and were less likely to be worried about swine flu.

First author Dr James Rubin, King's College London, said: 'Contrary to speculation about media 'scaremongering', exposure to media reporting or government advertising about swine flu was associated with people being less rather than more worried about it. So the media had a reassuring, rather than a scaremongering, effect.'

During the 2009 swine flu pandemic, the UK government urged members of the public to adopt several behaviours in order to reduce the effects of the outbreak – cleaning hands regularly, using tissues and using automated telephone numbers or websites to check on symptoms. Later, certain groups of the population where approached to have the swine flu vaccination.

All the people surveyed were asked to state how worried they were about the possibility of personally catching swine flu. Some groups were also asked how likely they were to take up a swine flu vaccination if offered it and whether they had recently carried tissues, bought sanitising hand gel, avoided using public transport, been to see a GP, visited a hospital, or called NHS Direct for a flu-related reason.

The percentage of 'very' or 'fairly' worried participants varied between almost 10 per cent and just over 30 per cent. There was an association between the volume of media coverage and the level of worry, even after adjusting for the severity of the outbreak at that time. However, this effect only occurred during the UK's first summer wave of swine flu and did not continue.

Just over 56 per cent of people interviewed were very or fairly likely to accept the swine flu vaccination if offered it. They were more likely to accept it if they were worried about the possibility of themselves or their child catching swine flu.

Co-author Dr Henry Potts, UCL, said: 'Exposure to media coverage or advertising about swine flu increased the perceived effectiveness of behaviours such as tissue carrying or buying hand gel, but reduced the perceived effectiveness of strategies such as avoiding public transport. So the coverage and advertising broadly had a positive effect on those behaviours that the Government were recommending.

'This demonstrates that when levels of public worry are generally low, increasing the volume of mass media and advertising coverage is likely to increase how effective people think certain behaviours are and so increase their uptake. However, more work needs to be done to examine the responses of different demographic groups during a future pandemic.

SÉNAT

Rapport remis à Monsieur le Président du Sénat le 29 juillet 2010, N° 685
Session Extraordinaire de 2009-2010

France, Paris, SÉNAT, 29 juillet 2010

World Health Organization

Dr Margaret Chan

Director-General Statement following the ninth meeting of the Emergency Committee

Geneva, WHO, 10 August 2010
https://www.who.int/news/item/10-08-2010-director-general-statement-following-the-ninth-meeting-of-the-emergency-committee

The Emergency Committee held its ninth meeting by teleconference on 10 August 2010.

The Emergency Committee was given an epidemiological overview and update of the global H1N1 (2009) pandemic influenza situation by the secretariat. Particular emphasis was placed on the epidemiological situation in the southern hemisphere, where many countries are experiencing their winter influenza season. The update also covered certain countries reporting active pandemic influenza virus transmission. Representatives of the governments of Argentina, Australia, India, New Zealand and South Africa described the most recent developments in their countries. Particular attention was given to the situation in some countries which are currently experiencing intense influenza epidemics largely caused by the H1N1 (2009) virus.

While noting such epidemics with concern, the Committee based its assessment on the global situation. Members noted clear indications that influenza, worldwide, is transitioning towards seasonal patterns of transmission. In the majority of countries, out-of-season outbreaks are no longer being observed, and the intensity of H1N1 (2009) transmission is lower than that reported during 2009 and early 2010. Members further noted that the H1N1 (2009) virus will likely continue to circulate for some years to come, taking on the behaviour of a seasonal influenza virus.

The Committee agreed that the global influenza situation no longer represented an extraordinary event requiring immediate emergency actions on an international scale. In their view, the public health emergency of international concern, recommended following the emergence of the H1N1 (2009) virus, should be considered over. The Committee further noted that the temporary recommendations adopted in response to the public health emergency of international concern were terminated.

After extensive discussions, the Committee unanimously advised the Director-General that the world was no longer experiencing an influenza pandemic, but that some countries continue to experience significant H1N1 (2009) epidemics. Members agreed that waiting for winter data from the southern hemisphere had been necessary in order to make such a global assessment with reasonable confidence.

The Committee noted that the information from India, New Zealand and the Pacific Island countries was consistent with the expectation that individual countries might experience significant levels of influenza associated with the H1N1 (2009) virus in the future, and expressed the need for national authorities to continue to implement outbreak response measures in those countries when such events occur. The Committee strongly emphasized the need for States to maintain vigilant disease surveillance and monitoring for influenza outbreaks and influenza-like illness as well as ensuring the availability of necessary public health measures for preventing and controlling influenza.

Such measures include the continued use of H1N1 (2009) pandemic or seasonal influenza vaccines where appropriate and available. The Committee noted that the uptake of pandemic vaccine in some Pacific Island countries appeared sufficiently high to reduce the risk of outbreaks in these countries.

Based on the advice of the Emergency Committee, and her own assessment of the situation, the Director-General determined that the world was no longer in an influenza pandemic and therefore terminated the public health emergency of international concern in accordance with the International Health Regulations (2005).

In light of these determinations, the Director-General thanked the members and the advisor of the Emergency Committee for their diligent service and expert advice, which were of great importance to international public health.

The work of the Emergency Committee now being ended, the names, affiliations and declared interests of the Committee members and advisor will be published on the WHO website as soon as possible.

World Health Organization

H1N1 IHR Emergency Committee

WHO, 25 April 2009 - 10 August 2010
https://www.who.int/groups/h1n1-ihr-emergency-committee

The IHR Emergency Committee concerning Influenza Pandemic (H1N1) 2009 met on nine occasions from April 2009 to August 2010. At its first meeting on 25 April 2009, following the advice of the Committee, the WHO Director-General determined that the ongoing events constituted a Public Health Emergency of International Concern (PHEIC). The Director-General terminated the PHEIC on 10 August 2010.

A List of the Members includes: Dr Lawson Ahadzie (Ghana), Mr. André Basse (France), Dr Muhammad Akbar Chaudhry (Pakistan), Dr Supamit Chunssuttiwat (Thailand), Dr Nancy Cox (US), Dr Anthony Evand (Canada), Prof. John S. Mackenzie (Australia), Prof. Arnold Monto (US), Dr Fernando Otaiza (Chile), Dr Rogelio Pérez Padilla (Mexico), Professor Wing Hong Seto (Hong Kong), Dr Masato Tashiro (Japan), Dr Claude Thibeault (Canada), Dr John Wood (UK), Professor Maria Zambon (UK); Advisor to the Emergency Committee Mr. Prof. Neil M. Ferguson (UK).

Dr Margaret Chan

Director-General's opening statement at virtual press conference
H1N1 in post-pandemic period

Geneva, WHO, 10 August 2010.
https://www.who.int/news/item/10-08-2010-h1n1-in-post-pandemic-period
https://web.archive.org/web/20100812022101/http://www.who.int/mediacentre/news/statements/2010/h1n1_vpc_20100810/en/index.html

The world is **no longer in phase 6 of influenza pandemic alert**. We are now moving into the post-pandemic period. The new H1N1 virus has largely run its course.

These are the views of members of the Emergency Committee, which was convened earlier today by teleconference.

The Committee based its assessment on the global situation, as well as reports from several countries that are now experiencing influenza. I fully agree with the Committee's advice.

As we enter the post-pandemic period, this does not mean that the H1N1 virus has gone away. Based on experience with past pandemics, we expect the H1N1 virus to take on the behaviour of a seasonal influenza virus and continue to circulate for some years to come.

In the post-pandemic period, localized outbreaks of different magnitude may show significant levels of H1N1 transmission. This is the situation we are observing right now in New Zealand, and may see elsewhere.

In fact, the actions of health authorities in New Zealand, and also in India, in terms of vigilance, quick detection and treatment, and recommended vaccination, provide a model of how other countries may need to respond in the immediate post-pandemic period.

Globally, the levels and patterns of H1N1 transmission now being seen differ significantly from what was observed during the pandemic. Out-of-season outbreaks are no longer being reported in either the northern or southern hemisphere. Influenza outbreaks, including those primarily caused by the H1N1 virus, show an intensity similar to that seen during seasonal epidemics.

During the pandemic, the H1N1 virus crowded out other influenza viruses to become the dominant virus. This is no longer the case. Many countries are reporting a mix of influenza viruses, again as is typically seen during seasonal epidemics.

Recently published studies indicate that 20–40% of populations in some areas have been infected by the H1N1 virus and thus have some level of protective immunity. Many countries report good vaccination coverage, especially in high-risk groups, and this coverage further increases community-wide immunity.

Pandemics, like the viruses that cause them, are unpredictable. So is the immediate post-pandemic period. There will be many questions, and we will have clear answers for only some. Continued vigilance is extremely important, and WHO has issued advice on recommended surveillance, vaccination, and clinical management during the post-pandemic period.

Based on available evidence and experience from past pandemics, it is likely that the virus will continue to cause serious disease in younger age groups, at least in the immediate post-pandemic period. Groups identified during the pandemic as at higher risk of severe or fatal illness will probably remain at heightened risk, though hopefully the number of such cases will diminish.

In addition, a small proportion of people infected during the pandemic, including young and healthy people, developed a severe form of primary viral pneumonia that is not typically seen during seasonal epidemics and is especially difficult and demanding to treat. It is not known whether this pattern will change during the post-pandemic period, further emphasizing the need for vigilance.

As I said, pandemics are unpredictable and prone to deliver surprises. No two pandemics are ever alike. This pandemic has turned out to be much more fortunate than what we feared a little over a year ago.

This time around, we have been aided by pure good luck. The virus did not mutate during the pandemic to a more lethal form. Widespread resistance to oseltamivir did not develop. The vaccine proved to be a good match with circulating viruses and showed an excellent safety profile.

Thanks to extensive preparedness and support from the international community, even countries with very weak health systems were able to detect cases and report them promptly.

Had things gone wrong in any of these areas, we would be in a very different situation today.

I will be happy to answer your questions.

WHO chief says H1N1 flu pandemic is over

Reuters, 10 August 2010, 9:24 PM

https://web.archive.org/web/20221115034321/https://www.reuters.com/article/idINIndia-50750620100810

GENEVA (Reuters) - The H1N1 pandemic is over and the global outbreak turned out to be much less severe than was feared just over a year ago, the head of the World Health Organization (WHO) said on Tuesday.

WHO director-general Margaret Chan once again rebutted criticism that the United Nations agency had hyped the first pandemic in more than 40 years, whose mildness left some Western governments holding huge stockpiles of unused vaccines.

The Hong Kong public health expert said the world had been lucky the H1N1 virus had not mutated into a more deadly form and that a safe vaccine developed in record time remained effective against it.

"We are now moving into the post-pandemic period. The new H1N1 virus has largely run its course," Chan said.

"That was the right call," she said, defending the decision taken in June last year to declare a pandemic.

The swine flu virus will continue to circulate as part of seasonal influenza for years to come, requiring health authorities to remain vigilant, she told a news conference.

It still threatens high-risk groups including pregnant women who would benefit from vaccination, she said.

Stockpiled H1N1 vaccines remain effective against the strain and so far the virus has not developed widespread resistance to the antiviral oseltamivir, the best treatment, she said.

The WHO's downgrading of the H1N1 outbreak to "post-pandemic" was based on recommendations by external influenza experts who conducted a review earlier in the day.

"I think even if we see severe outbreaks occurring in some countries – which is still definitely possible – that the global threat is really much lower and much different than a year ago," Keiji Fukuda, WHO's top flu expert, told reporters.

Continued Vigilance

In June 2009, the WHO said a new swine flu virus, H1N1, that emerged in the United States and Mexico and spread around the world in six weeks, was the first pandemic since 1968. A full pandemic corresponds to phase 6 on the WHO's six-point scale.

"We need to continue to maintain our vigilance and not be complacent," Chan said, noting that outbreaks continued in countries including India and New Zealand.

The behavior of influenza viruses is notoriously difficult to predict and no two pandemics are alike, flu experts say.

"I am very pleased that European member states prepared for something worse. I'd rather have it go that way than their planning for less or not being prepared at all," Angus Nicoll, influenza program coordinator at the European Center for Disease Prevention and Control, told Reuters Tuesday.

The WHO has also rejected allegations that it acted under the influence of drug companies in declaring a pandemic.

Chan said that three viruses were now circulating as part of a "mixed virus pattern" in many countries, typically seen during seasonal epidemics. These were H1N1 and H3N2 -- both type 'A' influenza -- as well as type 'B'.

Either H1N1 vaccine or a trivalent (triple shot) vaccine against the three strains should be used to inoculate those at risk, depending on their availability, she said.

"Pandemic and seasonal vaccine in both hemispheres confer the same protection (against H1N1)," Fukuda said.

An estimated 350 million people worldwide have been vaccinated against H1N1, he said.

Dozens of companies make influenza vaccines, including Sanofi-Aventis SASY.PA, GlaxoSmith Kline GSK.L, Novartis NOVN.VX, AstraZeneca AZN.L and CSL CSL.AX. Roche DNA makes the frontline antiviral oseltamivir, marketed as Tamiflu.

The U.S. Centers for Disease Control and Prevention said the WHO pronouncement will not alter U.S. plans for the upcoming flu season. The CDC recommends that everyone over 6 months of age be vaccinated against seasonal flu this year, the most universal recommendation yet for flu vaccines.

Twenty-second pandemic pharmacovigilance update

European Medicines Agency, 19 August 2010, EMA/527985/2010
https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=&cad=rja&uact=8&ved=2ahUKEwig0uKksb2AAxVhXmwGHRSHABMQFnoECBAQAQ&url=https%3A%2F%2Fwww.ema.europa.eu%2Fen%2Fdocuments%2Freport%2Ftwenty-second-pandemic-pharmacovigilance-update_en.pdf&usg=AOvVaw1mKV4Npi6twRfSuLDunapC&opi=89978449

This report summarises the adverse drug reactions reported after the use of the centrally authorised pandemic vaccines Arepanrix, Celvapan, Focetria and Pandemrix, and the antiviral Tamiflu1. It also provides information on the evolution of the H1N1 pandemic, an estimate of how many doses of vaccines and antivirals have been distributed or administered in Europe, and other available information on the benefits and risks of the vaccines and antivirals.

The Director-General of the World Health Organization (WHO) announced on 10 August 2010 that the world has moved from phase 6 of influenza pandemic alert to the post-pandemic period (see WHO statement here). In advance of this development, the Agency's Committee for Human Medicinal Products (CHMP) recommended that three of the centrally authorised pandemic vaccines used in Europe should be given full marketing authorisations allowing for their use outside a declared influenza pandemic.

...

Pandemic information

In its bi-weekly influenza surveillance overview dated 13 August 2010, the European Centre for Disease Prevention and Control (ECDC) concluded that, during the weeks of 26 July to 8 August 2010, epidemiological indicators showed no influenza activity in the 19 reporting EU countries.

By 2 May 2010, there had been a total of 2,900 deaths due to the pandemic announced by EU/European Free Trade Association (EFTA) Member States. Click here for a breakdown by country.

See the ECDC pandemic website for additional information on the influenza A/H1N1 pandemic.

In its weekly update dated 13 August 2010, the WHO reported that Influenza H1N1 (2009) virus transmission remains locally intense in parts of India and New Zealand.

Based on epidemiological data, a preliminary estimate of vaccine field effectiveness (VE) from Germany, which was published in Eurosurveillance, indicates for Pandemrix an excellent VE in people aged 14-59 years (96.8%; 95% confidence interval (CI): 95.2-97.9) and moderately high VE in those aged 60 years or older (83.3%; 95% CI: 71.0-90.5. Other published data from Scotland have reported a VE of 95.0% (95% CI 76.0 to 100.0). See also the latest ECDC Executive Science Update no 11 (April–June 2010) for an overview of the ECDC funded Influenza Monitoring of Vaccine Effectiveness (I-MOVE) project during the season 2009/10. Its preliminary data from eight countries (France, Hungary, Ireland, Italy, Romania, Portugal, Spain and United-Kingdom) consistently showed good vaccine effectiveness of the pandemic vaccines.

How far did the UK government over-respond to the 2009 threat of Swine Flu?

LSE, 18 October 2010

https://blogs.lse.ac.uk/politicsandpolicy/how-far-did-the-uk-government-over-respond-to-the-2009-threat-of-swine-flu/

Managing major risks creates problems for governments when probabilities are hard to estimate and outcomes are uncertain. Reviewing the experience of the 2009 swine flu pandemic fear, ***Adam Oliver*** *argues that the UK government over-reacted in some key respects. Partly underlying this response was an 'aversion to ambiguity' pattern of behaviour that has long been studied by social scientists. Ambiguity aversion led to an under appreciation by ministers of the opportunity costs of acting, resulting in the government prolonging an insufficiently targeted use of antivirals, and the purchasing of more flu vaccine than was necessary, at an additional cost of perhaps £500 million.*

In the spring of 2009, the UK government claimed that the country was well prepared to respond to the global swine flu outbreak. The response was based upon a feared outbreak of avian flu. Swine flu ultimately proved milder and less deadly that a worst case avian flu outbreak, which has led some to conclude that the government overreacted to the 2009 threat. One possible explanation for an excessive response from the government is given by ambiguity (or 'uncertainty') aversion. That is, the behaviour of the swine flu virus was unknown, and thus the government attached disproportionate weight to the worst possible outcome of the threat. A dislike of ambiguity, or ambiguity aversion, implies that people will pay a high price to avoid it, or, when it cannot be avoided, they adopt a pessimistic approach and overweight the slight possibility of the worst outcome occurring.

The potential drivers of the government's strong response were manyfold. For example, Sir Liam Donaldson, the Chief Medical Officer for England at the time, had for many years invested much effort in highlighting the threat of pandemics. Moreover, the initial information from Mexico appeared to suggest that the virus was associated with rapid spread and high fatality. In parallel, the modellers that the government relied on to predict the outcome of the 2009 outbreak relied on parameters that reflected more accurately the greater severity of the avian flu outbreak, and fears provoked by previous pandemics had a significant influence on the government. For instance, the Asian flu and Hong Kong flu outbreaks in 1957 and 1968-69, respectively, had each killed 1-4 million people, and the Spanish flu outbreak of 1918-19 is estimated to have killed up to 40 million people worldwide.

Between 27 April and 2 July 2009, the government focused upon a swine flu containment strategy, the focal point of which centred on the use of antiviral medications. The government implemented a policy of recommending antiviral use by those who had come into contact with anyone infected with the virus, in the hope that this would slow the spread and thus give more time to learn about the virus' characteristics before it had spread extensively throughout the population. The English government adopted a 'treat all' approach with respect to antivirals, meaning that all those with swine flu symptoms were advised to take the medications. However, by mid May the Health Protection Agency recommended that the use of antivirals be reduced, due to the observed side of effects of the medications, the large number of people who were not completing the courses of the drugs, and the risk of causing drug resistance. The English government did not change its policy until the beginning of July, and thus its actions regarding the use of antivirals can reasonably be viewed as excessive. However, in this case, any excessive reaction is perhaps less likely to have been motivated by ambiguity aversion per se; rather, the principal motivation may well have been to maintain public confidence.

Losing public confidence is a possible opportunity cost of not acting aggressively, but there are also opportunity costs of acting too aggressively that the government may have insufficiently considered. Initially, the reasonable worst case scenario specified up to 65,000 deaths, intended for planning purposes, but used by some in the media as a prediction. This may have incited a degree of fear within the population. Aside from the disutility felt from personal anxiety, fear can lead to attention and resources being directed away from interventions that are potentially more health-enhancing and life-saving. In an independent review of the government's swine flu policy (the Hine Review), it was estimated that the response consumed £1.2 billion in direct costs. If a part of this spending could have been avoided with a more measured response, it could have been used to significant effect elsewhere. On the flipside of provoking short term fear is the danger of desensitising people to risk in the longer term. That is, in the longer term, the government could face accusations of 'crying wolf'.

By 2 July 2009, the government moved onto a treatment strategy, and focused on more targeted antiviral use. However, the stand-out feature of the treatment phase was the development and later use of a swine flu vaccine. In the Spring of 2009, Ministers had to choose between buying 30 million doses and 132 million doses of the vaccine, with the latter being sufficient to vaccinate the whole population effectively. The decision to purchase 132 million doses was confirmed on 17 June. This quantity of vaccine was ultimately not required. It took until 21 October before the vaccine was developed and cleared to administer, almost six months since the first UK cases of illness had been recorded on 27 April. The process could not have been significantly quicker. It has been estimated by some experts that a worst case pandemic would largely be over within four months of the first cases being recorded, which raises the question of whether a vaccine is likely to negate an outbreak significantly.

The government announced that high risk groups would initially be targeted for vaccination. These included those aged between six months and sixty-five years with low immunities or certain chronic illnesses, pregnant women, the non-healthy over sixty-fives, and frontline health care workers; in total, 13 million people. The government anticipated that 75 per cent of these would choose to be vaccinated. However, only 5.5 million people in total vaccinated themselves against the virus. Although it is likely that more people would have vaccinated themselves had the full threat been realised, the government would have been well advised of the likelihood that a significant percentage of the population would not have done so. The government thus purchased sufficient vaccine for a worst case scenario, which appears to lend itself to ambiguity aversion, but even if the worst case is certain to happen, a policy of purchasing vaccine for the whole population is questionable. By the time the vaccine is ready, the peak of the pandemic is likely to be over, many will have natural immunity, and a great number will not in any case vaccinate themselves.

To conclude, most of us are ambiguity averse. We will think of the opportunity costs of not acting, and be influenced by a 'what if' effect. Erring on the side of caution in such cases feeds into a basic human need for security. However, at the policy making level, it ought to be recognized that in addition to the opportunity costs of not acting (e.g. the potential political costs, the possible loss of public confidence, the loss of life if the worst happens), there are opportunity costs of acting (e.g. provoking unnecessary fear, the repercussions from 'crying wolf', the lives and health lost by diverting resources away from other services) that should not be overlooked. The contention here is that, in part due to an aversion to ambiguity, the government in England overlooked to some extent the opportunity costs of acting, which led them to prolong an insufficiently targeted use of antivirals, and to purchase more vaccine than they ought to have done.

Prevalence of seroprotection against the pandemic (H1N1) virus after the 2009 pandemic

– Can Med Assoc J, 18 October 2010; Epub 2010 Nov 23;182(17):1851-6.
doi: 10.1503/cmaj.100910.. PMID: 20956500; PMCID: PMC2988533.
https://www.cmaj.ca/content/182/17/1851

Abstract

Background: Before pandemic (H1N1) 2009, less than 10% of serum samples collected from all age groups in the Lower Mainland of British Columbia, Canada, showed seroprotection against the pandemic (H1N1) 2009 virus, except those from very elderly people. We reassessed this profile of seroprotection by age in the same region six months after the fall 2009 pandemic and vaccination campaign.

Methods: We evaluated 100 anonymized serum samples per 10-year age group based on convenience sampling. We measured levels of antibody against the pandemic virus by hemagglutination inhibition and microneutralization assays. We assessed geometric mean titres and the proportion of people with seroprotective antibody levels (hemagglutination inhibition titre ≥ 40). We performed sensitivity analyses to evaluate titre thresholds of 80, 20 and 10.

Results: Serum samples from 1127 people aged 9 months to 101 years were obtained. The overall age-standardized proportion of people with seroprotective antibody levels was 46%. A U-shaped age distribution was identified regardless of assay or titre threshold applied. Among those less than 20 years old and those 80 years and older, the prevalence of seroprotection was comparably high at about 70%. Seroprotection was 44% among those aged 20-49 and 30% among those 50-79 years. It was lowest among people aged 70-79 years (21%) and highest among those 90 years and older (88%).

Interpretation: We measured much higher levels of seroprotection after the 2009 pandemic compared than before the pandemic, with a U-shaped age distribution now evident. These findings, particularly the low levels of seroprotection among people aged 50-79 years, should be confirmed in other settings and closer to the influenza season.

Swine flu: top doctor warns of crisis as few have H1N1 jab

The Guardian, 21 December 2010, 21:06 GMT
https://www.theguardian.com/world/2010/dec/21/swine-flu-top-doctor-crisis

'Shockingly few' health professionals have been vaccinated as more than 300 people lie in critical care beds

The NHS may become unable to cope with the rapid spread of influenza because shockingly few people, including health professionals, have been vaccinated, a senior doctor warns today.

Professor Steve Field, who until last month was the chairman of the Royal College of General Practitioners, spoke out as the Department of Health revealed there are more than 300 people in critical care beds with flu and 17 people have died.

Field said the decision not to encourage the public to have a jab to protect themselves was "ill-advised" and needed to be urgently reversed.

The NHS should have acted more decisively to encourage people to have the jab because it was known that H1N1 swine flu was still circulating and that few NHS staff had the swine flu vaccine when it was offered to them late last year.

"Rates of uptake are shockingly low," said Field. "It was ill-advised not to have the public awareness campaign on seasonal flu jab uptake that we usually have, because we knew that the public and healthcare professionals were likely to become complacent after last year's swine flu pandemic wasn't the serious attack on the country that we thought it could be. With the added winter pressures on the NHS, we need NHS staff to be vaccinated as soon as possible, so that they can continue working, and we also need pregnant women and people who are vulnerable to have a flu jab that includes the swine flu vaccine as soon as possible."

He warned that there could be big problems after Christmas as the numbers build. "This is getting to the point where it's becoming an emergency for the public's health and also the NHS's ability to cope, and we want to avoid that," he said.

Yesterday, health secretary Andrew Lansley briefed the cabinet on flu and told colleagues the NHS had plenty of capacity to cope with an upsurge in cases. David Cameron told a press conference at Downing Street that the flu figures were a little worse than last year, but that despite a doubling of cases in the last week, the Department of Health had things under control. "I think there is a very good grip in the Department of Health on this issue. Andrew Lansley has a great grip over that department," he said.

The government's interim chief medical officer, Sally Davies, said at a briefing that England was experiencing a normal flu season. It was "just winter flu" but with swine flu as the dominant strain. "We have not got a pandemic," she said.

Of the 17 deaths so far, 14 have been confirmed as due to swine flu and none of the victims have been 65 or over. Eight are known to have been considered "at risk", such as people with asthma or heart problems – but that leaves nine who appear to have been previously healthy.

Most of those now in critical care are younger than is usual for a flu outbreak. While 23 of the 302 are aged 65 or over, 243 are aged 16 to 64. There are 12 children between the ages of five and 15 and 24 under-fives.

Take-up of the flu vaccine, which includes H1N1, has been very slow. Last year, on the back of the flu pandemic, the government spent £177,573 on advertising to persuade the elderly and those in at-risk groups to come forward.

This year, it was left to primary care trusts and GPs to tell people the vaccine was available. Davies said the Department of Health had been constrained by government spending curbs. "The government freeze on media meant we had to decide how best to use our resources, which were ploughed into local campaigns and local work. At the end of the winter we will have to assess where we are for future years," she said.

Professor Lindsey Davies, president of the UK Faculty of Public Health, said not enough had been done to persuade people to be vaccinated. "It may well be that the lack of a national campaign is making the difference to the take-up at the moment, and that's regrettable." It was "disappointing" that last year's Catch It, Bin It, Kill It anti-swine flu campaign had not been continued, she added.

The shadow health secretary, John Healey, said the government needed to "get a grip" on the outbreak. Lansley had been, suggesting he had been obsessed with reorganising the NHS and had "The only attention he's paid to the preparations for this winter's flu outbreak is to axe the autumn advertising campaign to encourage people to get vaccinated and make them aware of the risks. He made the wrong judgement and it's "left too many people without the flu protection they should have"," he said.

Davies sought to reassure people on the spreading flu outbreak, saying "the numbers are not massive and we are not at anything like capacity [in the NHS]".

However, she urged at-risk groups to get themselves protected. "We want more people to come forward for the vaccine, particularly pregnant women," she said.

But critical care beds around the country have come under pressure as the numbers taken ill have increased. In some places, this has led to the suspension of routine heart surgery and other procedures where critical care beds are essential for recovery.

For some of the sickest victims of swine flu, a procedure called ECMO, in which blood is oxygenated outside the body, has been used. But the UK has only a small number of ECMO beds. The main centre is Glenfield hospital in Leicester, which has five ECMO beds. Last week, because of demand, extra beds were commissioned at four other major centres – Papworth, the Royal Brompton in London, South Manchester and Newcastle. There are now 16 patients on ECMO treatment in England.

Paul Flynn, Labour

General Matters: Part of the debate in the House of Commons on 5th April 2011.

Newport West, 5 April 2011, 6:11 pm
https://www.theyworkforyou.com/debates/?id=2011-04-05c.987.0

The swine flu pandemic that never was is an extraordinary story of bad science, fortunes made, public money wasted and fear-mongering on a mass scale. It started in May 2009 when a new branch of flu was detected in Mexico. The epidemiology then and now is still the same – that this flu was very mild. It killed about one in every 10,000 who had it.

On the World Health Organisation website in May 2009, the definition of a phase 6 pandemic – a crucial issue – was that the flu had to be likely to cause “a terrible number” of deaths and serious injuries. In the next month, that definition was changed to take the severity of the flu out of the definition; it was described as a flu that was being experienced in more than two WHO areas. In June 2009, however, Margaret Chan declared a phase 6 pandemic. The world press turned up and asked what a phase 6 pandemic was and whether there was a phase 6.5 or a phase 7 pandemic. She said, “No, this is the most severe pandemic – the top one.” Understandably, the world press went into hysteria mode and announced that this was as bad as the 1918 flu that killed between 25 million and 40 million people.

There was never any possibility that it was going to turn out like that. In this country, Liam Donaldson said that the likelihood was that deaths would be between

3,000 and 750,000. The average we should expect, he said, was 65,000 deaths. The WHO said that we should expect between 2 million and 7 million deaths in the world. In the event, there were 18,000 deaths. In Britain, there were 447 deaths of people with swine flu, but fewer than 150 died of swine flu. It is, of course, a tragedy for all the individuals involved, but this was nothing compared to the normal seasonal flu we have almost every year, when 10,000 and sometimes 20,000 people die.

The World Health Organisation has been challenged since and there have been a number of inquiries. In this country, we had an inquiry by Deirdre Hine, but I am afraid that it was premature. It did not come up with the right answers because it did not ask the right questions. There is a far better inquiry, just published, by the European People’s Party group in the European Parliament. Its main conclusion is that next time, the severity of the flu must be a feature in any warnings given. It is extraordinary that in calling this a phase 6 pandemic, no judgment was made about the severity of the disease.

What was the cost to this country? We spent £1.2 billion and we suffered greatly from anxiety and fear. That was particularly the case for parents of young children, who were told that there would be 65,000 deaths. The health service was disrupted for nearly a year. All its priorities were changed, and vital services were neglected so that the necessary preparations could be made. Heaven knows

what the cost was of the closure of all the schools, for instance. All that was unnecessary, and we must now consider what we can do about it. It is difficult to blame the national Governments, because they would be damned if they did and damned if they didn't, but can we say that spending more than £1 billion in Britain had a good result? Can we say that more people would have died if we had not spent that money? In fact, the reverse is true.

A splendid example is provided by Ewa Kopacz, who was the Polish Health Minister at the time. In November 2009, she made a very brave speech saying that the Polish Government would not buy vaccines and antiviral medicines because she did not believe that H1N1 flu posed any serious threat. In Britain, having spent £1 billion, we lost 7.4 people per million of the population; Poland, having spent about 7 zlotys, ended up with 4.7 deaths per million. In other words, Poland spent virtually nothing, and suffered half the number of deaths per million that we suffered. There is a lesson to be learnt from that. As I said earlier, I do not blame the national Governments, because they were in a very difficult position. They had the advice of the World Health Organisation, which is a body that we should respect, because we need a body that is above the national melee and national interests. Can we blame the World Health Organisation? We certainly can.

I have been to Geneva on a number of occasions. Incidentally, my general election result was greatly improved by the fact that I was there at the time. Because of the ash cloud I had to stay there for five days, which, according to my constituency workers, helped to ensure that the swing against the Labour party was one of the lowest in Wales, and to secure my re-election. Absence is a great factor. However, although we have heard reports from various organisations throughout the world, we must face the fact that the problem lay not with national Governments but with the World Health Organisation. The decision was taken by an emergency committee with 15 members –

The invention of the swine-flu pandemic

Eur J Epidemiol, 9 April 2011, 26:187–190
DOI 10.1007/s10654-011-9573-6

Introduction

The hype about the swine-flu pandemic is over. Should we, therefore, forget about this episode? We feel that there is a need to evaluate on a national as well as international level the events which have occurred and the mistakes which have been made.

The announcement of the swine-flu pandemic on June 11, 2009 by the World Health Organization (WHO) was a real precedent. In May 2009 WHO eliminated the severity of disease from the definition of stage six of a pandemic and demanded as sole criterion the swift and worldwide spread of a new virus against which the population has no immunity.

For the first time expensive measures against a pandemic such as the production of vaccines and mass vaccination were initiated worldwide. The pandemic stage six has been kept until August 2010, although there was neither any indication for serious health threats from A/H1N1 influenza, nor was the virus "new".

...

What have we learned from the swine-flu-affair?

What needs to be done?

Firstly – The current concept of pandemics has to be reconsidered and it should be accepted that the spread and severity of infectious diseases is generally more dependent on social conditions of populations than on the properties of the infectious agent [9]. Most people including scientists and politicians are hardly aware of the fact, that the A/H1N1 virus of the Spanish Influenza has hit populations stricken by war and hunger: Poor, frail and undernourished people paid the highest death toll. According to Murray, Lopez et al [10] mortality figures from the Spanish flu showed a 31-fold variability according to the nutritional- and social status of the respective populations; in a hypothetical re-occurrence of the Spanish Influenza pandemic, 96% of all deaths would occur in the developing countries and only 4% in the developed world [10]. Therefore, the swine-flu vaccination campaigns in Europe and North America were especially inappropriate. Obviously, the most effective way to prevent any infectious disease pandemic is to invest in the improvement of social conditions [9, 11]. Tuberculosis is an excellent example. This major scourge was very prevalent and produced a high death toll at the time, when the mycobacterium tuberculosis was detected by Robert Koch [12]. Although there was no effective treatment, the disease declined dramatically with the improvement of social conditions. When streptomycin appeared on the scene (1952) the epidemic in Europe had nearly disappeared.

Secondly – Sound infectious disease epidemiology must be applied to the surveillance of influenza epidemics, e.g. define the target population, draw appropriate random samples from the respective population to obtain unbiased estimates of the incidence of flu like symptoms and of the viral status of the sample. Such methodology allows for proper inference of the spread and the

virulence of the espective infectious agent. Data currently provided by the Global Influenza Surveillance Network are insufficient; they are not population based and therefore do not provide reliable data on disease severity, nor on case fatality. The data on the seasonal influenza show similar weaknesses and the estimates of disease frequency, mortality, and case fatality are similarly vague [13]. Consequently, the effectiveness of seasonal influenza vaccination campaigns and of anti-viral medication is more than questionable [13].

Thirdly – Conflicts of interest of scientific advisors to WHO or to other international and national public health institutions regarding connections with the respective pharmaceutical industry must be disclosed and acted upon in a similar fashion as is the case for employees of and advisors to WHO regarding the tobacco industry [14].

Fourthly – To blame the media alone for the horror scenarios pertaining to the swine-flu pandemic is too simple. The media most often conveyed messages they received from scientists (with hidden links to vaccine producers), representatives of government agencies close to those experts, and WHO. However, contrary to WHO and its experts there were a number of critical journalists questioning the pandemic scenarios. Also not all countries in Europe were following WHO's advice: The minister of health of Poland decided not to buy any swine-flu vaccine. Consequently, there was no vaccination campaign against A/H1N1 in Poland; however, the course of the disease there was similarly mild as in the other European countries.

Fifthly – WHO failed to give appropriate guidance in the swine flu pandemic. To prevent this from recurring, new strategies for the evaluation of the impact of new infectious diseases are needed.

According to ... Doshi [15] four scenarios are conceivable:

- a severe disease infecting many (Type 1),
- a severe disease infecting few (Type 2),
- a mild disease infecting many (Type 3) and
- a mild disease infecting few (Type 4).

So far WHO has misclassified SARS, avian flu and swine flu as Type 1 diseases, which produced a hat trick of false alarms within less than a decade [16].

Future WHO emergency committees must comprise scientists from a wide range of disciplines thus diminishing the chance of misclassification of future infectious disease epidemics. Advice from disease experts, e.g. molecular virologists, is important, but final policy recommendations must come from scientists trained in evaluation, priority setting, and public health and being fully independent [17].

WHO processes on dealing with a pandemic need to be overhauled and made more transparent

BMJ, 31 May 2011; 342: d3378
doi: 10.1136/bmj.d3378.

The World Health Organization failed to manage possible conflicts of interests between its expert advisers and industry in handling the H1N1 flu pandemic, an independent review panel has found.

The review, chaired by Harvey Fineberg, president of the US Institute of Medicine, concluded procedures were inadequate, should be overhauled, and made more transparent.

The panel found no evidence of “attempted or actual influence” by commercial interests on advice or decisions taken by the WHO concerning the pandemic. But WHO failed to acknowledge legitimate reasons for some criticism, in particular, inconsistent descriptions of a pandemic that “may have inadvertently contributed to confusion and suspicion.”

An investigation published last year by the BMJ and the Bureau of Investigative Journalism (BMJ 2010;340:c2912, doi:10.1136/bmj.c2912) found that key scientists advising the WHO on planning for an influenza …

Oseltamivir and risk of lower respiratory tract complications in patients with flu symptoms: a meta-analysis of eleven randomized clinical trials

Clin Infect Dis. 15 June 2011 // 1 August 2011; 53(3): 277-279. doi: 10.1093/cid/cir400.
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3137795/

Abstract

An independent reanalysis of 11 randomized clinical trials shows that oseltamivir treatment reduces the risk of lower respiratory tract complications requiring antibiotic treatment by 28% overall (95% confidence interval [CI], 11%–42%) and by 37% among patients with confirmed influenza infections (95% CI, 18%–52%).

Conclusion

Our reanalysis confirms that oseltamivir reduces the risk of LRTC treated with antibiotics among patients with flu symptoms or with confirmed influenza. The 24-day risk reduction was about 28% overall and 37% in patients with influenza infection. No reduction was observed in patients without influenza. The effect estimates changed little even under rigorous sensitivity analyses. We also confirmed previous reports of increased risk of nausea and vomiting [2, 10], but found no evidence of increased risk of neuropsychiatric disorders, except for headache, among those assigned to oseltamivir.

As for any meta-analysis, the quality of our estimates depends on the quality of the individual studies. Of the 11 trials included in the meta-analysis, only 2 have been published in peer-reviewed journals [11, 12].

The other 9 were either unpublished or published only in abstract form until their findings were reported by Kaiser et al. Jefferson et al considered the unpublished trials analyzed by Kaiser et al as ‘‘inaccessible to proper scrutiny’’ and excluded them from their Cochrane meta-analysis.

However, the unpublished trials are no more favorable to oseltamivir than the published ones. Using only the 2 published trials, the reduction in the 24-day risk of LRTC treated with antibiotics is 65% (risk ratio, .35; 95% CI, .15–.82) in the oseltamivir arms.

Our reanalysis has at least 2 limitations.

First, it was not possible to assess the potential benefit for high-risk participants who are hospitalized [13], because the sample size of most studies was too small to consider hospitalization as an outcome.

Second, the data in these studies were collected in an era without viral resistance to oseltamivir. The effectiveness of oseltamivir may be different now.

ACLU

President Obama signs Indefinite Detention Bill into Law

American Civil Liberties Union (ACLU), 31 December 2011, 4:26
https://www.aclu.org/press-releases/president-obama-signs-indefinite-detention-bill-law

President Obama signed the National Defense Authorization Act (NDAA) into law today. The statute contains a sweeping worldwide indefinite detention provision. While President Obama issued a signing statement saying he had "serious reservations" about the provisions, the statement only applies to how his administration would use the authorities granted by the NDAA, and would not affect how the law is interpreted by subsequent administrations. The White House had threatened to veto an earlier version of the NDAA, but reversed course shortly before Congress voted on the final bill.

"President Obama's action today is a blight on his legacy because he will forever be known as the president who signed indefinite detention without charge or trial into law," said Anthony D. Romero, ACLU executive director. "The statute is particularly dangerous because it has no temporal or geographic limitations, and can be used by this and future presidents to militarily detain people captured far from any battlefield. The ACLU will fight worldwide detention authority wherever we can, be it in court, in Congress, or internationally."

Under the Bush administration, similar claims of worldwide detention authority were used to hold even a U.S. citizen detained on U.S. soil in military custody, and many in Congress now assert that the NDAA should be used in the same way again. The ACLU believes that any military detention of American citizens or others within the United States is unconstitutional and illegal, including under the NDAA. In addition, the breadth of the NDAA's detention authority violates international law because it is not limited to people captured in the context of an actual armed conflict as required by the laws of war.

"We are incredibly disappointed that President Obama signed this new law even though his administration had already claimed overly broad detention authority in court," said Romero. "Any hope that the Obama administration would roll back the constitutional excesses of George Bush in the war on terror was extinguished today. Thankfully, we have three branches of government, and the final word belongs to the Supreme Court, which has yet to rule on the scope of detention authority. But Congress and the president also have a role to play in cleaning up the mess they have created because no American citizen or anyone else should live in fear of this or any future president misusing the NDAA's detention authority."

The bill also contains provisions making it difficult to transfer suspects out of military detention, which prompted FBI Director Robert Mueller to testify that it could jeopardize criminal investigations. It also restricts the transfers of cleared detainees from the detention facility at Guantanamo Bay to foreign countries for resettlement or repatriation, making it more difficult to close Guantanamo, as President Obama pledged to do in one of his first acts in office.

Oseltamivir for influenza in adults and children: systematic review of clinical study reports and summary of regulatory comments

BMJ, 9 April 2014;348:g2545.
doi: 10.1136/bmj.g2545. PMID: 24811411; PMCID: PMC3981975.
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3981975/

Abstract

…

Results: From the European Medicines Agency and Roche, we obtained clinical study reports for 83 trials. We included 23 trials in stage 1 (reliability and completeness screen) and 20 in stage 2 (formal analysis).

In treatment trials on adults, oseltamivir reduced the time to first alleviation of symptoms by 16.8 hours (95% confidence interval 8.4 to 25.1 hours, P<0.001).

There was no effect in children with asthma, but there was an effect in otherwise healthy children (mean difference 29 hours, 95% confidence interval 12 to 47 hours, P=0.001).

In treatment trials there was no difference in admissions to hospital in adults (risk difference 0.15%, 95% confidence interval -0.91% to 0.78%, P=0.84) and sparse data in children and for prophylaxis.

In adult treatment trials, oseltamivir reduced investigator mediated unverified pneumonia (risk difference 1.00%, 0.22% to 1.49%; number needed to treat to benefit (NNTB) 100, 95% confidence interval 67 to 451). The effect was not statistically significant in the five trials that used a more detailed diagnostic form for "pneumonia," and no clinical study reports reported laboratory or diagnostic confirmation of "pneumonia." The effect on unverified pneumonia in children and for prophylaxis was not significant. There was no significant reduction in risk of unverified bronchitis, otitis media, sinusitis, or any complication classified as serious or that led to study withdrawal. 14 of 20 trials prompted participants to self report all secondary illnesses to an investigator.

Oseltamivir in the treatment of adults increased the risk of nausea (risk difference 3.66%, 0.90% to 7.39%; number needed to treat to harm (NNTH) 28, 95% confidence interval 14 to 112) and vomiting (4.56%, 2.39% to 7.58%; 22, 14 to 42).

In treatment of children, oseltamivir induced vomiting (5.34%, 1.75% to 10.29%; 19, 10 to 57). In prophylaxis trials, oseltamivir reduced symptomatic influenza in participants by 55% (3.05%, 1.83% to 3.88%; NNTB 33, 26 to 55) and households (13.6%, 9.52% to 15.47%; NNTB 7, 6 to 11) based on one study, but there was no significant effect on asymptomatic influenza and no evidence of a reduction in transmission.

In prophylaxis studies, oseltamivir increased the risk of psychiatric adverse events during the combined "on-treatment" and "off-treatment" periods (risk difference 1.06%, 0.07% to 2.76%; NNTH 94, 36 to 1538) and there was a dose-response effect on psychiatric events in two "pivotal" treatment trials of oseltamivir, at 75 mg (standard dose) and 150 mg (high dose) twice daily (P=0.038). In prophylaxis studies, oseltamivir increased the risk of headaches on-treatment (risk difference 3.15%, 0.88% to 5.78%; NNTH 32, 18 to 115), renal events with treatment (0.67%, -0.01% to 2.93%), and nausea while receiving treatment (4.15%, 0.86% to 9.51%; NNTH 25, 11 to 116).

Conclusions:

In prophylactic studies oseltamivir reduces the proportion of symptomatic influenza. In treatment studies it also modestly reduces the time to first alleviation of symptoms, but it causes nausea and vomiting and increases the risk of headaches and renal and psychiatric syndromes. The evidence of clinically significant effects on complications and viral transmission is limited because of rarity of such events and problems with study design. The trade-off between benefits and harms should be borne in mind when making decisions to use oseltamivir for treatment, prophylaxis, or stockpiling.

Tamiflu: drugs given for swine flu 'were waste of £500m'

The Telegraph, 10 Apr 2014, 12:01AM BST
https://www.telegraph.co.uk/news/health/swine-flu/10756200/Tamiflu-drugs-given-for-swine-flu-were-waste-of-500m.html

Drug Tamiflu does nothing to halt the spread of influenza and Government wasted nearly £500 million stockpiling it over swine flu pandemic, study finds.

The drug Tamiflu, given to tens of thousands of people during the swine flu pandemic, does nothing to halt the spread of influenza and the Government wasted nearly £500 million stockpiling it, a major study has found.

The review, authored by Oxford University, claims that Roche, the drug's Swiss manufacturer, gave a "false impression" of its effectiveness and accuses the company of "sloppy science".

The study found that Tamiflu, which was given to 240,000 people in the UK at a rate of 1,000 a week, has been linked to suicides of children in Japan and suggested that, far from easing flu symptoms, it could actually worsen them.

Roche claimed at the time of the 2009 swine flu outbreak that trials had shown that it would reduce hospital admissions and complications such as pneumonia, bronchitis or sinusitis.

Based on the results, the Department of Health bought around 40 million doses of Tamiflu at a cost of £424 million and prescribed it to around 240,000 people. In 2009, 0.5 per cent of the entire NHS budget was spent on the drug.

However, researchers from The Cochrane Collaboration, a not-for-profit organization which carries out reviews of health data, found that Tamiflu only cut flu-like symptoms from seven days to 6.3 days and there was no evidence of a reduction in hospital admissions.

Eight children who took the drug in Japan ended up committing suicide after suffering psychotic episodes. Other side effects included kidney problems, nausea, vomiting and headaches.

Many people reported feeling anxious or depressed when taking the drug.

Data from 20 trials of Tamiflu also suggested that it prevented some people from producing sufficient numbers of their own antibodies to fight infection.

Dr Carl Henegen, professor of evidence-based medicine at Oxford, said: "This drug was given to 1,000 people a week over a phone line, but it was no better for symptom relief than over-the-counter medication – and you're talking about potentially serious complications. I wouldn't prescribe it to my patients."

Dr Tom Jefferson, an epidemiologist with The Cochrane Collaboration, added: "The stuff is toxic. It increased the risk of psychiatric events, headaches and renal events in one in 150 people. People reported nausea, vomiting and constriction of the airways. In Japan eight children jumped out of windows and committed suicide." The report's authors said they had struggled to obtain the original trial data from Roche, which initially claimed it was confidential.

The Government began stockpiling Tamiflu in 2006 over fears about bird flu after it was approved by the National Institute of Health and Clinical Excellence. It is not widely prescribed for regular flu.

Roche said it “fundamentally disagrees” with the latest findings.

Dr Daniel Thurley, the company’s UK medical director, added: “We disagree with the overall conclusions of this report. Roche stands behind the wealth of data for Tamiflu and the decisions of public health agencies worldwide, including the US and European Centres for Disease Control and Prevention and the World Health Organisation.

“The report’s methodology is often unclear and inappropriate, and their conclusions could potentially have serious public health implications. Neuraminidase inhibitors are a vital treatment option for patients with influenza.”

The Department of Health said that Tamiflu had a “proven record” of safety, quality and efficacy. But a spokesman said health officials would consider the latest Cochrane review “closely”.

The review is published on Thursday in the British Medical Journal [*Oseltamivir* = *Tamiflu*].

Stockpiles of Roche Tamiflu drug are waste of money, review finds

Reuters, 10 April 2014, 1:47 pm EDT
https://web.archive.org/web/20140410191430/http://www.reuters.com/article/2014/04/10/us-roche-hldg-novartis-search-idUSBREA390EJ20140410

(Reuters) - Researchers who have fought for years to get full data on Roche's flu medicine Tamiflu said on Thursday that governments who stockpile it are wasting billions of dollars on a drug whose effectiveness is in doubt.

In a review of trial data on Tamiflu, and on GlaxoSmithKline's flu drug Relenza, scientists from the respected research network the Cochrane Review said that while the medicines can shorten flu symptoms by around half a day, there is no good evidence behind claims they cut hospital admissions or lessen complications of the disease.

"There is no credible way these drugs could prevent a pandemic," said Carl Heneghan, one of the lead investigators of the review and a professor of evidence-based medicine at Britain's Oxford University.

The review's main findings were that the medicines had few if any beneficial effects, but did have adverse side effects that were previously dismissed or overlooked.

"Remember, the idea of a drug is that the benefits should exceed the harms," Heneghan said. "So if you can't find any benefits, that accentuates the harms."

Yet Roche, which has been under fire for several years over its refusal to allow the Cochrane team unrestricted access to Tamiflu data, rejected the findings, saying it "fundamentally disagrees with the overall conclusions" of their study.

"We firmly stand by the quality and integrity of our data ... and subsequent real-world evidence demonstrating that Tamiflu is an effective medicine in the treatment and prevention of influenza," it said in a statement.

Tamiflu sales hit almost $3 billion in 2009 - mostly due to its use in the H1N1 flu pandemic - but they have since declined.

The drug, one of a class of medicines known as neuraminidase inhibitors, is approved by regulators worldwide and is stockpiled in preparation for a potential global flu outbreak. It is also on the World Health Organization's "essential medicines" list.

The United States has spent more than $1.3 billion buying a strategic reserve of antivirals including Tamiflu, while the British government has spent almost 424 million pounds ($703 million) on a stockpile of some 40 million Tamiflu doses.

"Down The Drain"

Heneghan's team say their analysis is the first based on full data - from 20 trials of Tamiflu, known generically as oseltamivir, and 26 trials of Relenza, also known as zanamivir.

At a briefing in London about their findings, Heneghan said the money spent on stockpiles "has been thrown down the drain" because, until now, the full data had not been seen by regulators, governments, doctors or patients.

"The original evidence presented to government agencies around the world was incomplete," said Fiona Godlee, editor of the British Medical Journal which has spearheaded a four-year campaign to force Roche to reveal all its Tamiflu data.

"And when they (the Cochrane review team) eventually received the full information on these drugs, the complete evidence gives a very much less positive picture."

But the European Medicines Agency (EMA) - which approved the drug for sale in Europe - disputed the claim they had not seen all the Tamiflu data.

Enrica Alteri, head of medicines evaluation, said EMA had seen and reviewed all 20 studies referred to in the review, and this new analysis did not raise any fresh concerns or alter the agency's assessment that Tamiflu's benefits outweigh its risks.

Wendy Barclay, a flu expert at Imperial College London with no links to the Cochrane Review or the drugs, said she still felt the benefits were worthwhile, particularly in a pandemic.

"If another pandemic came tomorrow, and the government had no drug with which to treat thousands of influenza infected patients, I imagine there would be a public outcry," she said.

The Cochrane review found that compared with a placebo, or dummy pill, Tamiflu led to a quicker alleviation of flu-like symptoms of around half a day (down from 7 days to 6.3 days) in adults, but the effect in children was more uncertain.

There was no evidence of a reduction in hospitalizations or in flu complications like pneumonia, bronchitis, sinusitis or ear infections in either adults or children, Heneghan's team said, and Tamiflu also increased the risk of nausea and vomiting in adults by around 4 percent and in children by 5 percent.

Godlee described the battle with Roche as a "really lengthy cat and mouse, Alice in Wonderland, bizarre experience of trying to get data on a drug which governments around the world were busy buying, stockpiling and spending billions of dollars on".

"Why did no-one else demand this level of scrutiny before spending such huge sums on one drug?" she said. "The whole story gives an extraordinary picture of the entrenched flaws in the current system of drug regulation and drug evaluation." ($1 = 0.6028 British Pounds)

Military Poised to Help FEMA Battle Swine Flu Outbreak

Fox News, 24 December 2015 4:01 PM EST
https://www.foxnews.com/politics/military-poised-to-help-fema-battle-swine-flu-outbreak

The Pentagon is preparing to make troops available if necessary to help the Federal Emergency Management Agency tackle a potential outbreak of the H1N1 virus this fall, FOX News has confirmed.

This comes as a government panel recommends certain groups be placed at the front of the line for swine flu vaccinations this fall, including pregnant women, health care workers and children six months and older.

The Advisory Committee on Immunization Practices panel also said those first vaccinated should include parents and other caregivers of infants; non-elderly adults who have high-risk medical conditions, and young adults ages 19 to 24. The panel, whose recommendations typically are adopted by federal health officials, voted to set vaccination priorities for those groups Wednesday during a meeting in Atlanta.

Obama administration officials told Congress that H1N1 vaccinations won't be available for several months.

Defense Secretary Robert Gates is preparing to sign an order authorizing the military to set up five regional teams to deal with the potential outbreak of H1N1 influenza if FEMA requests help.

A senior U.S. defense official told FOX News that the plan calls for military task forces to work in conjunction with the FEMA. No final decision has been reached on how the military effort would be manned, but one source said it likely would include personnel from all branches of the military.

It is not known how many troops would be needed and whether they would come from the active duty or the National Guard and Reserve forces.

In the event of a major outbreak, civilian authorities would lead any relief efforts, the official said. The military, as it would for a natural disaster or other significant emergency situation, could provide support and fulfill any tasks that civilian authorities could not, such as air transport or testing of large numbers of viral samples from infected patients.

As a first step, military leaders have asked Gates to authorize planning for the potential assistance.

Orders to deploy actual forces would be reviewed later, depending on how much of a health threat the flu poses this fall, the officials said

Наблюдая за пандемией свиного гриппа

BIG Picture, 26 October 2009 – 9 November 2009
https://bigpicture.ru/nablyudaya-za-pandemiej-svinogo-grippa/#more-19411

Работники здравоохранения по всему миру начинают массовую вакцинацию и отслеживают прогресс распространения вируса H1N1/09 (также называемого в СМИ «свиным гриппом»). Представители Всемирной организации здравоохранения недавно заметили, что вирус просочился практически во все страны мира, добравшись даже до отдаленных племен Венесуэлы и аборигенов Австралии. Хотя количество смертей от свиного гриппа остается низким (на данный момент 7000) по сравнению с уровнем смертности в период обычного сезонного гриппа (несколько сот тысяч смертей в год), медицинские работники озабочены нестабильностью вируса H1N1/09 и его тенденцией поражать молодых, более здоровых людей. В этом выпуске собраны фотографии, объединенные темой борьбы со свиным гриппом по всему миру.

2. Афганский мальчик продает защитные маски на рынке в Кабуле в понедельник 9 ноября 2009 года. В Афганистане от свиного гриппа погибло 11 человек. В этой стране сотни афганцев и международных войск борются с болезнью и участившимися действиями повстанческих сил. Афганское министерство здравоохранения сообщило в понедельник, что 710 случаев заражения свиным гриппом из 779 вообще произошли среди военных.

5. Лиза Фоли (В центре) смотрит, как врач Лана Пета вводит вакцину против гриппа H1N1 ее 5-летней дочери Мэдди в конгрегационалистской церкви Уэллесли Хиллся, Штат Массачусетс, в субботу 7 ноября 2009 года. Минздрав Уэллесли предоставил клинике 200 доз вакцины для детей от 2 до 19 лет.

6. Премьер-министр Украины Юлия Тимошенко в маске во время визита в районную больницу в Луцке в 400 км от Киева в понедельник 9 ноября 2009 года. Выборы президента Украины, запланированные на январь, могут быть отложены из-за свиного гриппа. Об этом официально заявили представители украинского правительства. (AP Photo/Aleksandr Prokopenko)

13. Молодой человек в противогазе в западно-украинском городе Львове 4 ноября 2009 года. Всемирная организация здравоохранения сообщает, что большая часть случаев гриппа на Украине были вызваны вирусом H1N1.

33. Тайваньскому президенту Ма Ин-цзю делают прививку против вируса гриппа H1N1 в начальной школе в округе Тайбэй 16 ноября 2009 года. Ма решил сделать прививку в знак поддержки вакцинации.

Totality of Evidence

Pre-Pandemic Timeline
Chronological order of significant global,
Australian and SA data points leading up to the COVID-19 Pandemic.

Totality of Evidence, 2023
https://totalityofevidence.com/pandemic-timeline/pre-pandemic-2000-2015/

...

On May 19, 2008, the WHO **Global Initiative on Sharing All Influenza Data** (GISAID) was launched at the 61st WHA as a public online database for influenza data, on the back of Indonesia's 2007 bird flu and the mainstream media's attention. [1, 2, 3] The initial funding to "kickstart the development of GISAID's EpiFlu™ database application" was provided by US HHS.

...

October 25, 2008, representatives from more than 120 countries and 26 international and regional organizations attended the 2008 International Ministerial Conference on Avian and Pandemic Influenza in Sharm el-Sheikh, Egypt. During this meeting, "**Contributing to One World, One Health**™ – A Strategic Framework for Reducing Risks of Infectious Diseases at the Animal-Human-Ecosystems Interface" was officially released. [1]

The document was put together based on recommendations of the 2007 International Ministerial Conference on Avian and Pandemic Influenza in New Delhi where FAO , OIE , WHO , UNICEF , the World Bank, and the United Nations System Influenza Coordination (UNSIC), said to be "built on the lessons learned from the highly pathogenic H5N1 avian influenza response during the early 2000's and presented a strategy for applying the One Health concept to emerging infectious diseases at the animal-human-ecosystem interface." [2, 3]

...

January 1, 2009 - New system for monitoring global health events:

EU Medical Information System (MedISys) is an internet monitoring and analysis system developed and managed by JRC, provides global Public Health focused events surveillance, which upon automated threat analysis will generate alerts.

The information processed by MedISys is derived from the Europe Media Monitor (EMM) also developed by the Europe's Joint Research Center (JRC). EMM developed around 2009

February 1, 2009 - Lipid Nanoparticle developer Acuitas Therapeutics is founded:

Acuitas Therapeutics is a private company incorporated in British Columbia, Canada. They were founded in February 2009 (initially as AlCana Technologies). Their "goal is to apply nanotechnology delivery solutions to improve the therapeutic options available to patients." They are the developers of the lipid nanoparticle (LNP) used to delivery mRNA code into cells. [1, 2]

May 6, 2009 - WHO changes the definition of a 'pandemic'

In May 2009 the WHO lowered the standards for defining a pandemic, not taking into account the number of infections and death (page 9, point 25), allowing for a 'pandemic' to be declared when a new virus is NOT causing serious harm to most of the population.

A 'pandemic' post-May 2009 can be declared simply if "a disease epidemic occurs when there are more cases of that [new] disease than normal." Previously an "enormous number of deaths and illness" was included in the criteria.

By changing the definition of "pandemic" in 2009 the WHO can declare a PHEIC for the seasonal flu across the globe, excessive mortality and relative lethality are no longer a criteria to be considered. Declaring a PHEIC is grounds for using vaccines under emergency status.

On the same day Jaques Attali, a French political theorist and special advisor to presidents wrote:
History teaches us that humanity only evolves significantly when it is truly **afraid**. The [H1N1 swine flu] pandemic that is beginning could trigger one of these structuring fears. We will then come to the point, much more quickly than would have been possible on economic grounds alone, *of putting in place the foundations of a true world government*. [See: 6 May 2009]

June 11, 2009 - WHO declares H1N1 influenza a pandemic
In 2009, a new H1N1 influenza virus emerged, causing the first global flu pandemic in 40 years, called Swine Flu.
On June 11, 2009, the World Health Organization (WHO) declared it a pandemic and raised the worldwide pandemic alert level to phase 6, which means the virus was spreading to other parts of the world. A month earlier the definition of pandemic was changed! [1, 2]
There was a big push for a fast-tracked vaccine, and 4 months after the declared pandemic, in October 2009 the vaccines rolled out, with manufacturers indemnified! Depending on the countries regulator, clinical trials were either 4 weeks in a few people or not required at all "as many clinical trials were done with similar annual vaccine preparation, and the **assumption** is that the new pandemic vaccine will behave similarly," thus shortening the timeline of for approval. [11]
England had ordered 132 million doses before there was any trial data. Only 6 million people, mainly pregnant women and children took the vaccine. The US CDC in July 2009 stopped testing, and said to diagnose "probable" or "presumed" as H1N1, thus exaggerating cases, but also advised recovered patients to "go ahead and get vaccinated anyway". [5, 6]
In August 2010, a few months into vaccine roll out Finland, Sweden and Iceland identified a problem in children and adolescents who developed narcolepsy. [4, 7] In February 8, 2011 the WHO reported 12 countries with narcolepsy cases, but advised to vaccinate anyway as it appears to be associated with only GSK Pandemrix vaccine and not a "general worldwide phenomenon". The vaccine was also attributed to febrile convulsions and miscarriage.
It took until 2013 before public health England acknowledged they had a narcolepsy problem too, and only 11 years later, in 2020 did public health England published more data that says in retrospect it was worse than we thought! [3, 8, 9, 10]

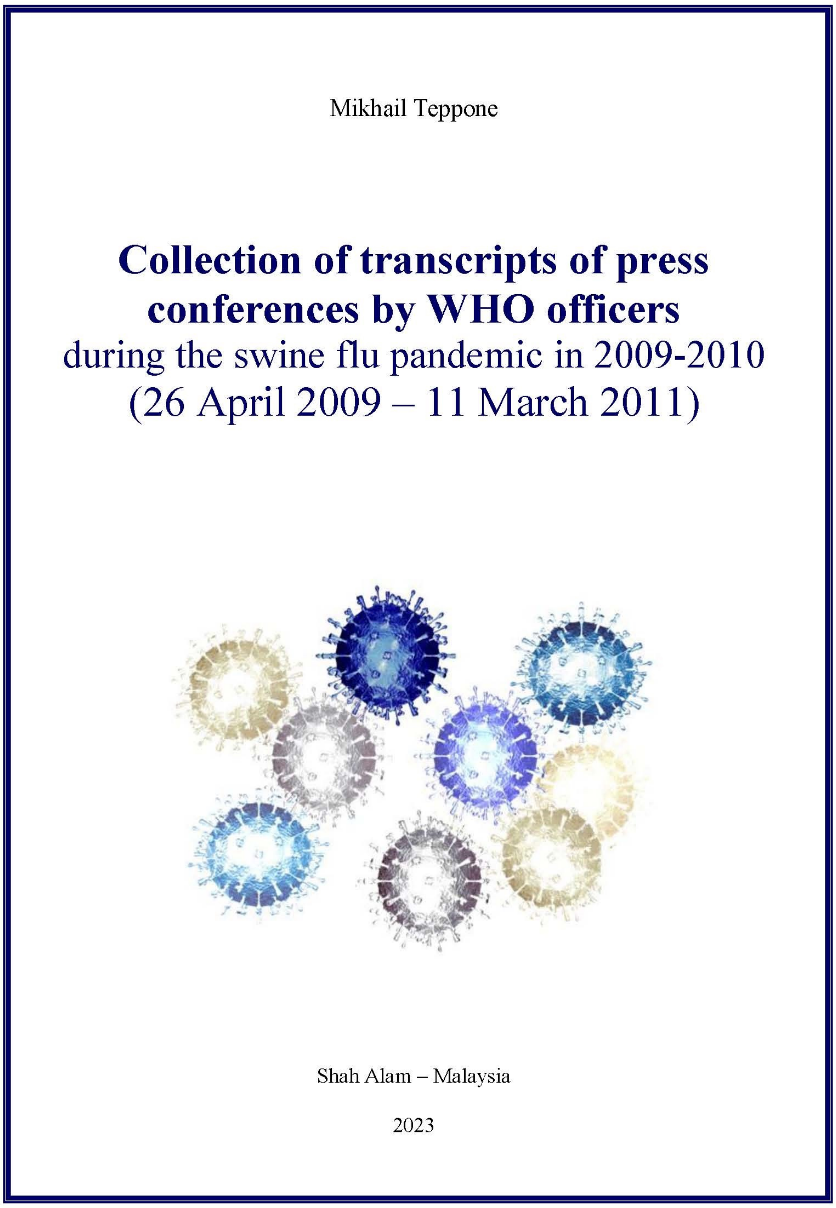
September 2, 2009
Pharmaceutical giant Pfizer agrees to pay $2.3 billion for fraudulent marketing with the intent to defraud or mislead. This is the largest health care fraud settlement in the US Justice Department's history. [1, 2, 3, 4]
In 2009 Pfizer's total revenue was around $50 billion, with a declining trend from 2011 to 2020. [5]. Vaccine revenue in 2021 are responsible for 60% of Pfizer's sales, with an expected $36 billion from vaccines alone!
Will this Big Pharma company be a repeat offender in 2020?

October 1, 2009
October 2009, the U.S. Agency for International Development (USAID) launched the **Emerging Pandemic Threats** program (**EPT-1**), a 5-year program targeting "the early detection of new disease threats; enhanced 'national-level' preparedness and response capacities for their effective control; and a reduction in the risk of disease emergence by minimizing those practices and behaviors that trigger the 'spill-over and spread' of new pathogens from animal reservoirs to humans." [1, 2]
This effort "grew out of a recognition that we are now in an era of new, re-emerging and recurring global health threats that argue for a longer-term, more strategic approach to global health security."
"EPT-1 and Avian Influenza work has been focused on building those capacities and expanding the evidence base that contributes to mitigating the impact of **novel** "high consequence pathogens" arising from animals."
In 2014 **EPT-2** was born which "will also make major contributions to the Global Health Security Agenda to more effectively address threats posed by the natural emergence of new disease threats, as well as the intentional and/or accidental release of dangerous pathogens." **... etc.**

Mikhail Teppone

Collection of transcripts of press conferences
by WHO officers during the swine flu pandemic in 2009-2011
(26 April 2009 - 11 March 2011)

Shah Alam, Malaysia, 2023, 409 p.
DOI: 10.13140/RG.2.2.29361.66409/3
https://archive.org/details/pandemic-h-1-n-1-2009



This Collection was prepared in the course of research on Swine Flu Pandemic that was discussed in 2009-2010. The need for this collection is due to the fact that some of the web pages with the press briefings have been removed from the original sites and have been preserved only in the web archive. The Collection has been prepared for research and education purposes to encourage further studies related to influenza pandemics that have occurred in the XXI century.

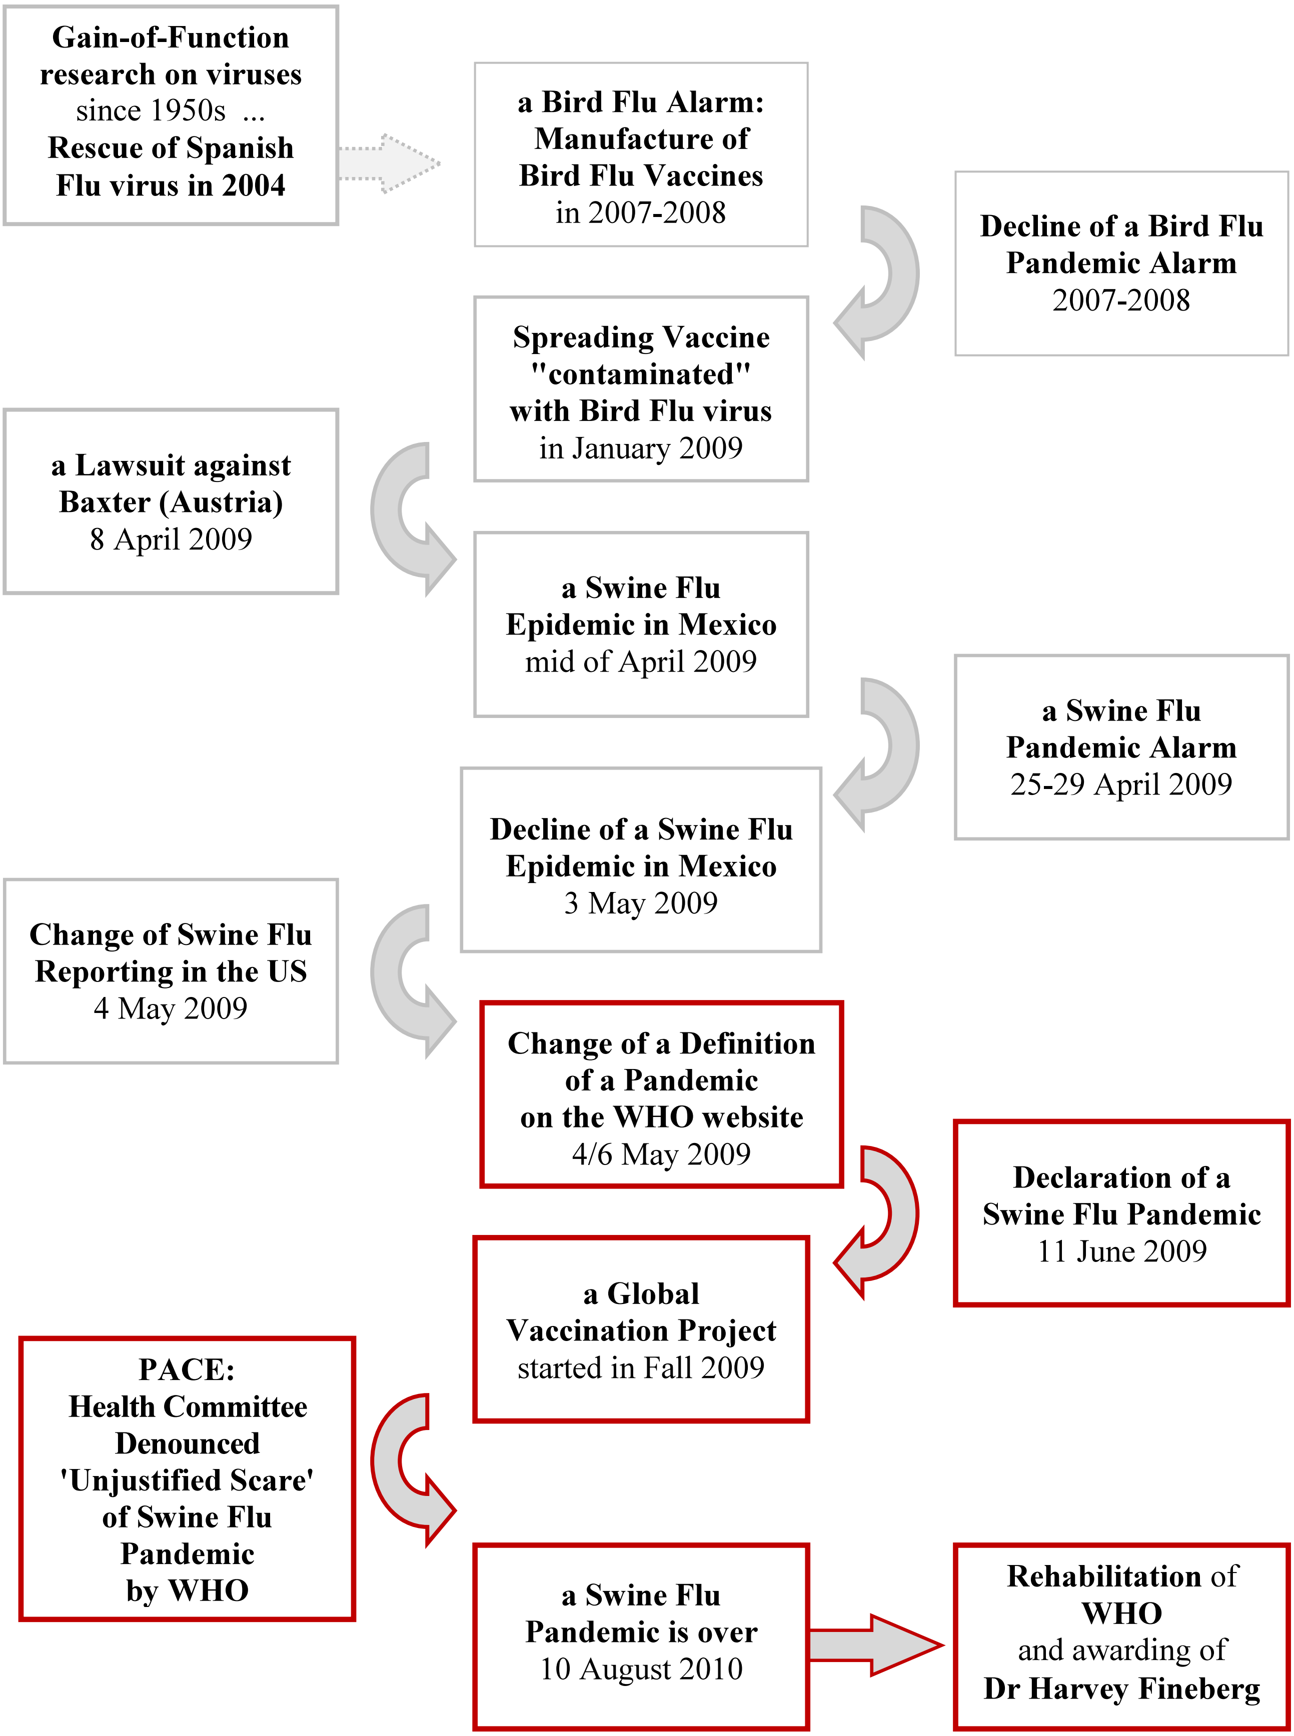
Rehabilitation of WHO

and awarding of

Dr Harvey Fineberg

Roadmap
of the Swine Flu Pandemic



THE BUREAU
OF INVESTIGATIVE JOURNALISM

WHO welcomes Bureau Investigation

The Bureau Investigates, 7 June 2010
https://www.thebureauinvestigates.com/stories/2010-06-07/who-welcomes-bureau-investigation/

On May 6th 2010, the Bureau and BMJ revealed that key scientists advising the WHO for guidelines on pandemic influenza had major financial links to pharmaceutical companies.

These links were not disclosed by the WHO, leading to potential conflicts of interest in its decision-making processes. The same day, the WHO faced strong criticism from the Council of Europe for a severe "lack of transparency."

Following this, Harvey Fineberg, President of the Institute of Medicine of the U.S. National Academy of Sciences, and chair of the WHO's internal review committee of the management of the H1N1 Pandemic, released the following statement:

"Our review committee welcomes the opportunity to learn from reports published today by the British Medical Journal and released by the Social, Health and Family Affairs Committee of the Parliamentary Assembly of the Council of Europe (PACE).

"These reports raise questions about potential, inappropriate influences on WHO decision-making in the assessment and response to the 2009 H1N1 pandemic and, more generally, question practices employed by WHO to guard against conflict of interest among its expert advisers. These topics are among those that will be fully considered by our review committee.

"At our upcoming meeting in Geneva (30 June – 2 July 2010) we anticipate hearing from critics of WHO as well as from those who were involved from the public and private sectors, at national and international levels, and in policy and decision-making related to the H1N1 pandemic."

The Bureau in the news

The revelations of the Bureau and BMJ have been picked up in over 800 news outlets worldwide.

Coverage includes Al Jazeera; The Washington Post; Daily Mail; Financial Times; BBC News and BBC World Service; The Guardian; The Herald; ABC America; Swiss National Radio; South Africa National Radio; Irish National Radio; BBC Spanish Service; RTE (Swiss) TV; BBC Radio Belfast; CBC and Reuters.

No proof of drug industry sway on WHO in pandemic-report

Reuters, 10 March 2011, 10:28 PM GMT+8
https://www.reuters.com/article/idUSLDE72917A/
https://jp.reuters.com/article/idUSTRE7293QG/

GENEVA, March 10 (Reuters) - Independent experts who examined the World Health Organisation's handling of the H1N1 pandemic said on Thursday they had found no evidence of drug industry influence on the U.N. agency's decision-making in the crisis.

But in a draft report made public, the panel said WHO had failed to recognise and manage conflicts of interest among some experts on its advisory Emergency Committee who had disclosed their ties to pharmaceutical companies.

The world remains "ill-prepared" to face a severe influenza pandemic or similar public health emergency, the experts added.

The United Nations agency announced in June 2009 that the newly-emerged H1N1 swine flu virus was causing the world's first influenza pandemic in more than 40 years. It declared the pandemic over in Aug. 2010, saying that the global outbreak had turned out to be much less severe than was feared.

"WHO performed well in many ways during the pandemic and confronted systemic difficulties and demonstrated some shortcomings," the panel said in a 33-page report. "The Committee found no evidence of malfeasance."

"As far as the Review Committee can determine, no critic of WHO has produced any direct evidence of commercial influence on decision-making," it added.

Critics who have suggested 'invisible commercial influences' may account for WHO's actions ignored the agency's core public health values to prevent disease and save lives, according to the panel headed by American flu expert Dr. Harvey Fineberg.

The Review Committee, composed of 27 experts, holds its last meeting in Geneva on March 28-30 to finalise its report which is to be submitted to WHO's annual ministerial meeting in May.

The panel criticised the WHO's lack of a consistent and measurable description for judging a pandemic's severity which had created confusion. It suggested a scale of three phases rather than the current six-phase scale which is under revision.

WHO bureaucracy had also prevented a timely distribution of donated vaccines in poor countries during the pandemic, it said.

GlaxoSmithKline and Sanofi-Aventis are among major producers of influenza vaccines.

"The world is ill-prepared to respond to a severe influenza pandemic or to any similarly global, sustained and threatening public health emergency," it said, citing the risk of massive disruption, suffering and loss of life.

MED НОВОСТИ

Эксперты сняли с ВОЗ обвинения в коррупции

Med Portal, 10 марта 2011
https://medportal.ru/mednovosti/eksperty-snyali-s-voz-obvineniya-v-korruptsii/

Группа независимых экспертов не обнаружила признаков коррупции в действиях Всемирной организации здравоохранения в период пандемии гриппа H1N1. Тем не менее, эксперты сочли неудовлетворительными разработанные международной организацией критерии пандемии, а также раскритиковали ее информационную политику.

Независимая комиссия сочла бездоказательными обвинения в коррупции в адрес руководства Всемирной организации здравоохранения (ВОЗ). Об этом, как сообщает AFP, говорится в 33-страничном проекте доклада группы экспертов, созданной в прошлом году для оценки действий ВОЗ в период пандемии гриппа H1N1.{#vrez.50123}

Ранее ВОЗ неоднократно обвиняли в раздувании паники вокруг гриппа в интересах производителей лекарств и вакцин. Расследование этих обвинений было одной из основных задач комиссии из 27 специалистов по гриппу во главе с американским эпидемиологом Харви Файнбергом (Harvey Fineberg).

Как указывается в проекте заключения комиссии, ни одному из критиков не удалось предоставить убедительных доказательств влияния фармацевтических компаний на действия ВОЗ в период последней пандемии.

Тем не менее, комиссия сочла неудовлетворительной информационную политику ВОЗ, в частности – сокрытие от общественности потенциального конфликта интересов у некоторых экспертов организации.

Помимо этого комиссия указала на расплывчатость критериев пандемии, использовавшихся ВОЗ, а также на недооценку такого показателя как тяжесть вызываемых пандемическим вирусом заболеваний.

ВОЗ объявила о начале первой за последние несколько десятилетий пандемии гриппа весной 2009 года, после вспышки гриппа, вызванного ранее неизвестным штаммом вируса H1N1, в Мексике и США. Позже ВОЗ пришлось признать, что последствия пандемии оказались менее серьезными, чем ожидалось.

Committee Sharply Critiques WHO's Pandemic Response

Science, 11 Mar 2011
https://www.science.org/content/article/committee-sharply-critiques-whos-pandemic-response

Eight months after the World Health Organization (WHO) declared the swine flu pandemic officially over, an independent expert group has given the global health agency a decidedly mixed evaluation of how it handled the entire episode, from the outbreak's frightening beginning to its lackluster end.

When health officials realized in April 2009 that an unusual number of people in Mexico were being hospitalized and dying from a novel strain of the influenza virus, global health experts girded for the worst: the possibility of a devastating pandemic like the 1918 one that killed up to 100 million people. At the outset, no one could predict that the novel H1N1 virus – a recombination of human, pig, and avian influenza genes – would turn out to be more wimp than monster. If it had lived up to initial fears, says a draft report by the International Health Regulations (IHR) Review Committee, an independent panel of 25 experts convened by WHO, many countries would have faced serious trouble. "The world is ill-prepared to respond to a severe influenza pandemic or to any similarly global, sustained and threatening public health emergency," concluded the committee's draft report, which WHO made public yesterday.

The panel, headed by Harvey Fineberg, president of the U.S. Institute of Medicine, assessed both WHO's response to the pandemic as well as the functioning of the IHR, a legal agreement between countries to coordinate responses to health threats that cross borders. The IHR went into effect in 2007 and had never had a real-world test.

The report praises the IHR and WHO for rapidly kicking into action a global surveillance network and helping countries track the virus and contain its spread. But it has plenty of sharp criticisms, too.

The committee, however, found "no evidence" to support the harshest allegations about WHO: that the organization rushed to declare that the 2009 H1N1 outbreak was a pandemic to enrich the coffers of vaccine makers. In contrast, the report says that WHO delayed declaring a pandemic until it was "undeniably occurring" and faults the organization for not having "a consistent, measurable and understandable depiction of severity." And it says WHO "fed suspicions" about its actions by insisting that Emergency Committee members who gave advice during the pandemic remain confidential and by not revealing their potential conflicts of interest. It further faults WHO for responding to criticisms with "insufficient vigour."

Nearly 80 million people in 77 countries received the influenza vaccine with WHO's help – including providing a "seed" strain of the virus used by manufacturers – but the report says that "numerous systemic difficulties" slowed distribution to low-resource countries. Among the committee's recommendations: establish a Global Health Emergency Corps and a $100 million emergency fund, simplify the six phases WHO agonized over when trying to describe the escalating outbreak (possibly just baseline, alert phase, pandemic), and create advance agreements for vaccine distribution and delivery.

Had this virus caused more severe disease, the committee asserted, "the unavoidable reality is that tens of millions of people would be at risk." It warned that unless "this fundamental gap between global need and global capacity is closed, we invite future catastrophe."

The IHR played "a central role" in the response to the pandemic, the report notes. These new regulations required for the first time that WHO member countries report disease outbreaks that might cross their borders and also stipulated that they provide WHO with scientific rationales if they independently take actions that impede traffic or trade, like restricting travel or banning the importation of pigs. "While the IHR are not perfect, they significantly advance the protection of global health," the report states. The IHR would work better, it says, if it had enforceable sanctions, in particular if a country fails to explain why it restricted traffic or trade – as happened during the pandemic.

David Heymann, an epidemiologist at the London School of Hygiene and Tropical Medicine who formerly worked at WHO as an assistant director general, commends the report's critique. "If the lessons learned that are outlined in the report are applied, the IHR will become more useful," he says.

Panel chair Fineberg declined to speak about the report's conclusions because the draft still must be reviewed by member states before his group writes a longer, final version. But he says that "the committee worked diligently for about a year, hearing from an enormous variety of informants and experts with a whole range of point of views. I feel that the committee presented as balanced and objective assessment as we could." Similarly, WHO says that it will reserve comment until it sees the final draft in early April, in time for it to be digested by delegates attending the World Health Assembly, which starts 16 May in Geneva.

ВЕСТНИК

Эксперты сняли с ВОЗ обвинения в коррупции

Фармацевтический Вестник, 11 марта 2011, 00:00
https://pharmvestnik.ru/content/news/eksperty-snjali-s-voz-obvinenija-v-korruptsii.html

Независимая комиссия сочла бездоказательными обвинения в коррупции в адрес руководства Всемирной организации здравоохранения (ВОЗ). Об этом, как сообщает AFP, говорится в 33-страничном проекте доклада группы экспертов, созданной в прошлом году для оценки действий ВОЗ в период пандемии гриппа H1N1.

Ранее ВОЗ неоднократно обвиняли в раздувании паники вокруг гриппа в интересах производителей лекарств и вакцин. Расследование этих обвинений было одной из основных задач комиссии из 27 специалистов по гриппу во главе с американским эпидемиологом Харви Файнбергом (Harvey Fineberg).

Как указывается в проекте заключения комиссии, ни одному из критиков не удалось предоставить убедительных доказательств влияния фармацевтических компаний на действия ВОЗ в период последней пандемии.

Тем не менее, комиссия сочла неудовлетворительной информационную политику ВОЗ, в частности – сокрытие от общественности потенциального конфликта интересов у некоторых экспертов организации.

Помимо этого комиссия указала на расплывчатость критериев пандемии, использовавшихся ВОЗ, а также на недооценку такого показателя как тяжесть вызываемых пандемическим вирусом заболеваний.

ВОЗ объявила о начале первой за последние несколько десятилетий пандемии гриппа весной 2009 года, после вспышки гриппа, вызванного ранее неизвестным штаммом вируса H1N1, в Мексике и США. Позже ВОЗ пришлось признать, что последствия пандемии оказались менее серьезными, чем ожидалось.

SPIEGEL Wissenschaft

Gremium wirft WHO gravierende Fehler vor

Spiegel, 11 march 2011, 17.52 Uhr
https://www.spiegel.de/wissenschaft/medizin/schweinegrippe-pandemie-gremium-wirft-who-gravierende-fehler-vor-a-750425.html

Das Ansehen der Weltgesundheitsorganisation hat durch ihren Umgang mit der Schweinegrippe schweren Schaden genommen. Jetzt hat ein Gremium die Arbeit der WHO bewertet. Die Experten üben harsche Kritik - und beklagen, dass die Welt auf eine schwere Pandemie nicht vorbereitet ist.

Es war Pandemie-Stufe 6: 2009 versetzte die Weltgesundheitsorganisation die Welt in höchste Alarmbereitschaft . Der Erreger H1N1, das Schweinegrippevirus, verbreitete sich über den Globus.
https://www.spiegel.de/spiegel/print/d-69407395.html

Fieberhaft wurden Impfstoffe entwickelt, riesige Kampagnen gestartet. Doch das Virus entpuppte sich als vergleichsweise milder Vertreter seiner Art. In Deutschland etwa ließ sich nur ein Bruchteil der Bevölkerung immunisieren - und die Länder blieben auf teuer eingekauftem Impfserum sitzen.
https://www.spiegel.de/wissenschaft/medizin/schweinegrippe-impfstoffe-bund-und-laender-streiten-ueber-millionenkosten-a-711246.html

Schweinegrippe-Impfung: Rund 30 Millionen Impfdosen waren in Deutschland übrig. Foto: ddp
\

Der WHO wurde nicht nur vorgeworfen, unnötig Angst verbreitet zu haben, sondern auch, dass sie im Sinne der Pharmaindustrie gehandelt hätte. Einige der Autoren, die an den Richtlinien der WHO zum Umgang mit Grippepandemien mitgewirkt haben, hätten zur gleichen Zeit Geld von den Pharmafirmen GlaxoSmithKline (GSK) und Roche erhalten, schrieben Journalisten in der Fachzeitschrift "British Medical Journal". https://www.spiegel.de/wissenschaft/medizin/schweinegrippe-pandemie-wie-die-who-das-vertrauen-der-verbraucher-verseucht-a-699427.html

WHO-Chefin Margaret Chan wies solche Kritik zurück:"Zu keiner Zeit, nicht für eine Sekunde, sind meine Entscheidungen von kommerziellen Interessen beeinflusst worden."

Weltgesundheitsorganisation

Ein unabhängiges Expertengremium sollte klären, ob die angemessen auf die Schweinegrippe reagiert hat. Jetzt hat die Gruppe eine vorläufige Version ihres Abschlussberichts vorgelegt. Ihr Urteil: Der WHO seien gravierende Fehler unterlaufen. Die Welt sei auf eine schwere Pandemie nicht vorbereitet, schreiben die Experten unter der Leitung von Harvey Fineberg vom Institute of Medicine in Washington DC.

Fehlende Transparenz bemängelt

Die WHO habe zwar in vielen Belangen richtig gehandelt, aber ihr seien auch kritische Fehler unterlaufen. Das Gremium bezeichnete die WHO-Definition, was eine Pandemie ist und in welchen Phasen sie verläuft, als unnötig komplex. Dass die Organisation einige online verfügbare Dokumente zur Pandemie ohne Hinweis verändert hatte, habe unweigerlich Misstrauen geschürt.

Ein weiterer Vorwurf: Die WHO habe geheim gehalten, welche Mitglieder in ihrem Beraterkomitee saßen. Auch sei die Organisation nicht vernünftig damit umgegangen, dass diese Berater, die zum Teil auch mit Pharmakonzernen zusammenarbeiten, eventuell nicht objektiv waren. Allerdings kommt das Gremium auch zu dem Schluss, die WHO sei nicht von kommerziellen Interessen beeinflusst worden. Man habe keine Hinweise auf rechtswidriges Verhalten entdeckt.

Der Bericht lobt, dass die WHO schnell Experten in hilfsbedürftige Länder geschickt habe, dass das Virus schnell entdeckt und seine Verbreitung beobachtet worden sei. Auch hob das Gremium hervor, dass die WHO binnen einer Woche nach dem Beginn der Epidemie Viren für die Impfstoffherstellung bereit gestellt hat.

Experten finden auch lobende Worte

Trotzdem warnen die Experten: "Die Welt ist schlecht auf eine schwere Influenza-Pandemie oder eine ähnliche globale Krankheitswelle vorbereitet." Es sei traurige Realität, dass eine ernsthafte Pandemie Opfer im zweistelligen Millionenbereich fordern könnte.

Der Bericht wird im Laufe des Monats bei einem Treffen in Genf präsentiert. Fineberg sagte, die WHO werde den Bericht erst kommentieren, wenn ihr die endgültige Fassung vorliegt.

AFN

Эксперты сняли с ВОЗ обвинения в коррупции со свиным гриппом

AFN, 11 марта 2011, 09: 40
http://afn.by/news/i/149441

Независимая комиссия сочла бездоказательными обвинения в коррупции в адрес руководства Всемирной организации здравоохранения (ВОЗ). Об этом, как сообщает AFP, говорится в 33-страничном проекте доклада группы экспертов, созданной в прошлом году для оценки действий ВОЗ в период пандемии гриппа H1N1.

Ранее ВОЗ неоднократно обвиняли в раздувании паники вокруг гриппа в интересах производителей лекарств и вакцин. Расследование этих обвинений было одной из основных задач комиссии из 27 специалистов по гриппу во главе с американским эпидемиологом Харви Файнбергом (Harvey Fineberg).

Как указывается в проекте заключения комиссии, ни одному из критиков не удалось предоставить убедительных доказательств влияния фармацевтических компаний на действия ВОЗ в период последней пандемии.

Тем не менее, комиссия сочла неудовлетворительной информационную политику ВОЗ, в частности – сокрытие от общественности потенциального конфликта интересов у некоторых экспертов организации.

Помимо этого комиссия указала на расплывчатость критериев пандемии, использовавшихся ВОЗ, а также на недооценку такого показателя как тяжесть вызываемых пандемическим вирусом заболеваний.

ВОЗ объявила о начале первой за последние несколько десятилетий пандемии гриппа весной 2009 года, после вспышки гриппа, вызванного ранее неизвестным штаммом вируса H1N1, в Мексике и США. Позже ВОЗ пришлось признать, что последствия пандемии оказались менее серьезными, чем ожидалось.

Transcript of press briefing with Dr Harvey Fineberg, Chair, International Health Regulations Review Committee, 28 March 2011

Geneva, WHO, 28 March 2011

https://web.archive.org/web/20110331104745/http://www.who.int/mediacentre/multimedia/pb_transcript_fineberg_20110328.pdf

Speaker key
HF Dr Harvey Fineberg
MP Member of the Press

HF Yes, okay so.. So I'll just say that what we had today was the fourth and the concluding plenary meeting of the review committee. That this was an opportunity for the committee to hear from member states and NGOs who are the recognised participants at the World Health Organisation, for their comments and advice based on the preview document that we distributed some weeks ago, to the member States.

And the preview document represents the principle findings, conclusions and recommendations that the committee, at that time, put forward. That background document includes three principle conclusions and 15 recommendations. Can I assume that you are all familiar with it or you have seen it? So the purpose today was to give an opportunity to the member states, first and foremost, and others to give us their feedback.

I would say that we heard from, perhaps, between 12 and 20 presenters today and we've received perhaps a total of between 20 and 30 comments, either verbally or written, about the preview document. A number of the observers commented in support of one or another or all of the major ideas in the document. And so those are of great welcome to us, but they're not the ones we're focussing on now.

We're looking to understand where there were questions or criticisms based on the individual states perceptions and advice to us. And now the committee's job will be to take those into account and to formulate our final report.

As a general matter, I would say that the committee did its best to produce a report based on all the evidence that we had before us. That evidence consisted of extensive interviews over the last year, which many of you also witnessed, a thorough assessment of documentary evidence, written materials related to both IHR and the pandemic.

I would say that our report endeavours to be measured in both elements worthy of praise and elements worthy of criticism. And we had some of both. We wanted this report to be constructive in that it was intended to help learn lessons in a constructive way, to improvement. And we wanted it to be forward looking in laying a base for future improvements for public health emergencies and pandemics among them.

Overall, I would say the comments today reinforce the major lines of our conclusions and many of the recommendations. The questions that came up were partly questions seeking clarification or more elaboration, for example, one of the recommendations that the committee offers is a recommendation about the distribution of vaccines, inbalance with the availability of viruses, the so called, open-ended discussions about virus sharing and vaccine distribution. And there were questions about exactly what did the committee mean when it said that States that received donated vaccines should adopt the same principles about liability as the States that purchase vaccines. So that was a question about that.

There was a question about the recommendation that suggested the establishment of a prepositioned line of credit, available in the case of a future emergency, exactly where should it be located, exactly why should it be at the scale that it is, those kinds of questions that came up. There was some suggestions about elements of the report, for example, one of the recommendations indicates that in accordance with each States assessment of its priorities and benefits and costs, that we urge wider use of vaccine against seasonal influenza, as a means, both of protecting the population and of extending the capacity for production in the time of a potential pandemic. One of the suggestions today, cautioned that if you have a rationale for immunisation in anything other than the protection of the population at that time, for that... against that disease, that it could, in the long term be a weakening public confidence in such recommendations.

So there was a caution in other words, that it... don't make too much of this idea that you're recommending seasonal flu vaccines simply to prepare for a pandemic production need, when in fact the recommendation could and should stand on its own, for the protection of people, year in and year out. So that's another example of the kind of suggestion that we heard. Right now, we're going to take all of this onboard, as a committee. The whole array of these several dozen suggestions and then formulate our final report. We expect that this report will be submitted for the World Health Assembly meeting in May and presented and discussed at that meeting. We hope that the report will be actionable and practical. A report that is simply on a shelf and not translated into action is not what we intend. So let me invite your questions and I look forward to trying to respond.

MP I have one question.

HF Please.

MP Your report, can it be seen as a template on how to judge future international measures taken by WHO to fight a pandemic?

HF I would even generalise it a bit more. You know, the report has a dual character. It is, on the one side, an assessment of the international health regulations and on the other side it's an assessment of the response to this pandemic. The part of the report that deals with improving the international health regulations is the part that I think will have, year-in and year-out value. Because every year we're going to have the need to call upon the kind of resources that the international health regulations establish, in surveillance, in monitoring, in communication, responding to everything from a radiation disaster in a country to natural disaster, to a future pandemic.

So those... that side of the recommendations, I think, will have literally every day value. Now when it comes to pandemic preparedness, a lot of the recommendations, for example, the whole array of priorities for research, in understanding the predictors of virulence and spread. And the other elements that we talk about, those will be of value also for seasonal influenza, not only in the case of the next pandemic. So to an extent, on both sides, of the pandemic review and the IHR review especially, I think there will be lasting and regular value of the review. And it will also prove its worth if it does manage to strengthen preparations before a next pandemic.

MP I was wondering, in the draft report the details are lacking, at least in the end and appendix on what... maybe draw some of the conclusions, for instance, that we didn't see any malpractice or any direct links between the way the policy was formulated by the secretariat and member States and any... and no direct links with a possible conflict of interest, by industry. But at the same time, we recommend the establishment of an ethical officer to oversee these events. What was the reasoning for this? And secondly, in the final report, will there be a listing of all the people who gave evidence and their submissions attached? Thank you.

HF Let me comment on the last point. We received very extensive submissions, from many sources. We also had access to some confidential documents, from within the WHO. All of the documents which are public, that is excluding those which we had access to by virtue of our special

status as a review committee, we expect will be publically available, by probably electronic means. They will not be printed in the print version of our report. So that, I think, is the way it will have public access.

The full report of course, will outline in much greater detail, the basis on which the conclusions and recommendations that are in this preview document come forward. And in particular, I would just comment on this question of the conflict of interests that you raised, and the recommendations.

It's impossible to prove a negative. That is, you cannot prove that there was an absence of influence. What we did say, and what we have concluded is, we could find no evidence for it.

We found no direct evidence from any source and we couldn't find any indirect evidence, other than assertions by some who believe it was the only plausible explanation.

We also believe that there are alternative explanations for the actions taken, that are more plausible to us and for which we have evidence that they in fact exist. I'm referring here, for example, to the power of the public health ethic, to prevent the loss of life, as one illustration. Now, when you're thinking about the future and the protection of both the integrity and the credibility of what the World Health Organisation is called upon to do, the fact that there was no evidence of malfeasance or of inappropriate influence by industry, that we could find, does not preclude, in fact, is entirely consistent with recommendations to strengthen the approach and management of conflicts of interest, by the organisation, that we do recommend.

So we're recommending it more in the spirit of good practice and prevention, than as a remedy for an error in the past. So that's the basis that we make our recommendation, with respect to the ethics officer and the other aspects of disclosure, for example, and dealing with conflict of interest. Is that a response?

MP Yes.

HF Good, okay. Other questions? Yes please, go ahead.

MP Just a follow-up question. I think you were asked some questions from the floor, about the advanced purchase pricing, but again, your report sheds no light on that. Is the final report going to provide some analysis on that aspect, which was an issue? That in earlier briefings, you highlighted, was very cumbersome and time consuming to negotiate these agreements with various providers of antivirals or vaccines. So...

HF There are two separate issues here. I don't want to conflate. The concern about the difficulty and time consuming character of negotiations in advance, referred not to national advanced purchase agreements, but rather to the World Health Organisation's effort to put in place agreements with multiple parties, that would facilitate and enable vaccine to be delivered to less well financed countries, who could not afford to purchase it. So we did not actually, as a committee, deal with the... directly with the process of negotiating in the countries that are buying vaccines for themselves, with the companies. That was not our mandate. We were very concerned with the process of negotiation around obtaining vaccine for redistribution in the world. And that was very problematic in the pandemic. It was slow, it was difficult.

Interestingly, the Director General, in her remarks at the meeting today, said that in her view it was predominantly systemic obstacles that made this a difficult task. The obstacles of the lack of harmony around regulation of vaccines, the difficulty of dealing with liability, which is a core concern of the manufacturers and the challenge of working through things like the cold chain, which had to be in place in order for donated vaccine to serve its intended purpose. So in her remark, she was emphasising again, how much effort they put into it and how hard it was. And the committee will have to take that into account in our final report, in terms of how we express what we believe can effectively be done in the future, to be more successful in this endeavour.

Because everyone recognises that it remains a very serious impediment to the world's ability to deal with a future pandemic.

MP I'm sorry sir, my question was, I think, from the floor you were asked specifically about the advanced purchase pricing and there was one suggestion that, perhaps in the future, there is transparency in the prices.

HF Ah, I see, yes, no that was a separate point, yes, okay.

MP And that's not reflected in your report.

HF No.

MP The question of how countries negotiated contracts and what triggered them and whether they were commercially above board, or not.

HF Yes, we didn't deal with that in our report, because the report itself, fundamentally could not deal with reviews of individual countries. This was not the extent of our capacity to examine. It was a very interesting observation however, I would add, about the lack of information about pricing. We just didn't examine it.
Yes?

MP How do you explain the basic assumption that it was necessary to buy all these doses of flu vaccine when *Poland bought nothing* [unclear]? *Poland had one of the lowest cases of flu anywhere*. Haven't you taken into account that maybe this wasn't even necessary at all and what were the initial decisions based on, in the end? And then there's also the other question, which I raised with you once before, it's the whole mindset, without talking about influence direct or indirect, it's the whole mindset that pervades the collaboration that namely anything that works with the corporate sector is going to be good, so that [unclear] don't question it.

And on the contrary, we tend to facilitate it and enhance these arrangements. [Unclear] at great pains to find any, sort of, serious, obvious influence and even indirect influence, yet it's an underlying assumption that's unspoken that ropes people and shapes their behaviour. Did you take any of this into account in the end? *What about Poland, how do you explain that*?

HF Well let me start with the fundamental question. The committee's view is that this was a real problem. That in the beginning there was great uncertainty as to how severe it would be, and that that uncertainty persisted through the time when purchase decisions had to be made. In my view, ignoring that evidence would not have been responsible as a measure to protect the public's health. Now, it's a little bit like saying; whether fire insurance was a good idea for your house. If you look back over the last year and your house did not burn down, do you then say, I was a fool for purchasing insurance?

MP Yet at the time there were *serious questions about where the information was coming from and the whole...* the development of the virus in Mexico, for example, and the implications of, who did this... To avoid any investigation into how they were raising their animals and how they were providing for incubation spaces for this virus.

HF Well you're now raising a completely different and important question about the origin of influenza pandemics. And indeed many new infections, in terms of their animal origin and the mixing of animals and humans. That's a separate question.
Influenza is a very versatile virus. And its capacity to simultaneously infect different species, is a very unusual property in the pathogen world. And that is one of the reasons that makes it a continually dangerous pathogen, because it has this multi species capacity and because of the changeability of its viral composition. But that's a completely different question from the validity of the evidence, early on, about real outbreaks of real disease, in a number of countries.
And the committee's view is that this evidence was clear and compelling. Now on the other point that you raised, which was, did the committee think about relations to industry, or what was the point that you assume...?

MP Underlying the [overtalking] which is much more difficult to identify.

HF Well the committee had no direct view of this. I mean, to give you an illustration, if vaccines were produced by non-profit or national laboratories, the committee's attitude toward vaccine would be exactly the same as if it's produced by companies that make profit. So the attitude of the committee, toward the manufacture and distribution of the vaccine had no bearing on whether it was produced by a forprofit company.

MP Which committee?

HF My committee.

MP No, but I'm talking about previous to that, those who were in WHO were so orientated towards the corporate sector and their willingness to push in the direction of anything that will profit industry.

HF I can't even comment on the premise of your question. I have no idea that that's true.

MP *I see it repeatedly, that's why I've raised the point*.

HF But what does that have to do with our review, if it is true?

MP *Because it's an underlying attitude that pushes in the direction of ordering huge doses of vaccine and perhaps neglecting to consider [unclear] information or whatever*.

HF Well...

MP And...

HF I still can't quite see how it's connected to what our review is trying to say. If your... If the argument is that the judgements about vaccine were premised on an underlying predisposition to help companies make a profit, we could find no evidence of this.

MP Not to help them make a profit, simply to accept without questioning what they want.

HF We could find no evidence of that. The judgements about the virus, the need for a vaccine, the testing of the vaccine, the distribution of the vaccine, were not unquestioned judgements that didn't try to weigh benefits and costs. They did look at risks of vaccine; they looked at efficacy of vaccine. This was not an unthinking global acceptance of a commercial product, without any examination. So I don't understand the premise of your question.

MP My question is what I see here so often. I've seen so much over the years I've been here, since 1996, 97. That's the premise of it. On the basis, the place is invaded by industry and industry gets ahead [unclear]. And that has influence in all sorts of areas.

HF Okay, I... Well I cannot dispute it, but I cannot accept it. Okay, [unclear] do we have time for one or two more quick questions?

MP You've talked about Doctor Chan's assessment. Did you share her assessment that no amount of planning is going to change that, you said it was a serious impediment. Do you share her assessment?

HF I'm going to take it on board. That is, I'm going to try to understand the basis of her sentiment and think very carefully about what exactly could potentially have been done, even now, could be done, in advance of a next pandemic. The one thing that I would say this experience clearly demonstrated is, you cannot do very much when in the midst of the emergency. That was demonstrated by the experience. Now, the question, how much could be done in advance, the committees initial view was that you could do more. And I think we have to now think about it in light of that comment and see whether we agree or not.

MP And just, the report says... It came out a few weeks ago, so I apologise for not being completely familiar anymore, with the exact way you phrased the recommendation, in terms of the severity, re-doing the scale. What are your expectations in terms of when that should be... or the committee's expectations about when that should be out?

HF Well, I think, on the question of severity, we're... we recognise the difficulty and the complexity of the measurement. What we're saying is, first that the WHO has to face up to the need to report severity and to measure it at different stages. And I think there's not much disagreement about that, as expressed today. The tricky and difficult part will now be, okay, reduce that to actionable indicators. And that's going to take some time and continued effort. And it's not as if it's never been attempted before. But every pandemic experience gives you a better handle on how you might be able to do it. And that's what we want to take advantage of.

MP Do you have any time, does the committee...?

HF The committee didn't say it has to be done, you know, within a year or within six months or two years. But I do think that it's going to take months and probably the better part of a year or two, to really nail this down. That's my estimate, but that's not what the committee is specifying. It's not something you can just turn around and pull out of a drawer. Any final question? Well thank you all very much. Yes, you have...? All right, we almost got done. We'll take one more... a quick one.

MP Coming back to Doctor Chan's comments, she left no stone unturned to try and get the donated vaccines to countries that didn't have the capacity. Some industry representatives said to us that some of the donations were available months in advance to WHO and did not go out to the potential recipient States. Today's version, from Doctor Chan is another interpretation. What did your insights show?

HF Yes, first the companies differed in their willingness to enter agreements. There was some negotiation that was difficult, but concluded successfully. There was other that was relatively easy and there was some that never concluded. So on the question of the readiness of companies to participate, there was a spectrum. On the question of getting the vaccine actually into the hands of doctors, nurses and other administrators in the country, you have still all of these issues about the cold chain and about the regulations in the country and approvals locally that Doctor Chan also indicated were significant obstacles.

And so it's very easy to imagine the circumstance where a representative of a company that was readily, relatively willing to contribute, would find themselves in an observation of delay, because of these other factors that are country specific, in getting the vaccine out. So you can see how you could reconcile those perspectives on the question of getting the vaccine to the recipient countries. And it underscores the complexity of it. I would say it also underscores the importance of advance arrangements insofar as they can be accomplished. So, I think, with that I thank you all and I look forward perhaps to see some of you at the World Health Assembly, or no...

MP Of course.

HF Of course, and we'll see how the discussion is at that venue.

MP And useful from our point of view I think.

Всемирная организация здравоохранения

Director-General responds to assessment of WHO's handling of the influenza pandemic

Geneva, WHO, 28 March 2011

https://www.who.int/director-general/speeches/detail/director-general-responds-to-assessment-of-who-s-handling-of-the-influenza-pandemic

Excellencies, distinguished members of the Review Committee, representatives of Member States, colleagues in the UN system, representatives of nongovernmental organizations, ladies and gentlemen,

Let me join your Chair in welcoming you to this fourth meeting of the Review Committee of the International Health Regulations.

I and my staff have carefully reviewed the preview document that will be presented and discussed during this session. We have looked especially closely at the document's three preliminary conclusions and its 15 preliminary recommendations.

Since the beginning of this process, WHO has expected to receive a frank, critical, and evidence-based assessment of strengths and weaknesses in the response as the 2009 influenza pandemic evolved.

We sought guidance on the performance of the IHR during this first major roll-out of its functions. In particular, we wanted a critical assessment of the performance of WHO in as many areas, and with as much detail as possible.

Above all, we wanted the Committee's conclusions and recommendations to be actionable. In other words, we wanted guidance on what needs to change, at technical, managerial, policy, and even financial levels, to improve WHO leadership when the next pandemic inevitably occurs.

Based on the preview document and the Committee's rigorous methodology, I am confident that your final report will meet these expectations.

Let me thank this Committee and its Chairman, Dr Harvey Fineberg, for the diligent, thorough, and objective approach you have taken and for your determination to collect and critically assess a vast amount of evidence and expert opinion.

You have heard testimony from people with widely divergent backgrounds, and also widely divergent views about the appropriateness and effectiveness of the WHO response. You were given unfettered access to the complete set of WHO internal documents.

As we all know, discussions today will be focused on the preview document. The Committee will then prepare its final report, which will be submitted to the World Health Assembly in May.

I look forward to hearing your views.

Response to interventions

Thank you, Chair, for giving me this opportunity to respond. I will stick to some big-picture issues.

The Secretariat has prepared a written response to the Committee's preliminary findings, and this response has been submitted to the Committee for its consideration.

As I said earlier today, WHO welcomes the preview document, its conclusions, and its recommendations. We will do our utmost to implement them.

But let me be very frank. Some of your recommendations will be far easier to implement than others, as has been mentioned by some Member States

In general, changes in policies, practices, and priorities that fall entirely within the purview of WHO and its governing bodies are comparatively easy to implement, though the amount of time needed for full implementation will vary, as will resource needs.

For example, your recommendation to accelerate implementation of core capacities required by the IHR echoes an explicit request made during the January Executive Board. This is a clear and urgent priority for WHO.

As noted, WHO needs to manage potential conflicts of interest much better. We are already doing so.

The document underscores the importance of flexibility to accommodate unexpected and changing conditions and to adapt rapidly to new circumstances. I could not agree more. Operational management was hemmed in by rigid definitions and plans.

An understanding of severity is part of the risk assessment of any public health emergency. It provides critical guidance to all ministers of health who need to make far-reaching decisions, often with significant financial implications, in an atmosphere of considerable scientific uncertainty.

We will need to manage these, and other issues identified in the report, better in the future.

More difficult to address are weaknesses in the pandemic response that lie outside the direct authority and beyond the direct influence of WHO.

These are weaknesses that arise from larger systemic difficulties. In other words, from the way this world and its international systems work.

Let me give you an example. The document refers to difficulties that impeded WHO's ability to achieve a timely distribution of donated vaccines.

I was personally, and passionately engaged in efforts to ensure that all developing countries had access to at least some vaccines quickly. That did not happen fast enough. In all sincerity, WHO could not have tried harder, devoted more energy and staff to this task, or acted with a greater sense of urgency.

The hurdles that slowed us down arise from the lack of harmonization of registration for medicines and vaccines, issues of liability that are part of company policies, and the simple fact that no country is willing to give up its sovereign right to authorize the marketing of a medical product. Issues surrounding the cold chain were another source of problems.

In my view, no amount of advance planning is going to change this reality or alter the way the systems work.

Ladies and gentlemen,

For me, personally, as head of this agency, the assessment of the pandemic response needed to address two absolutely critical questions and to give everyone a firm answer.

First, did WHO make the right call? Was this a real pandemic or not?

Second, were WHO decisions, advice, and actions shaped in any way by ties with the pharmaceutical industry?

In other words, did WHO declare a fake pandemic in order to line the pockets of industry?

The document exonerates WHO on both counts.

Had the Committee identified shortcomings in either of these two areas, such findings would have raised grave questions about the Organization's neutrality, technical credibility, and integrity.

At no point does the report question the decision to declare a pandemic. As noted, evidence from early outbreaks led many experts at WHO and elsewhere to anticipate a potentially more severe pandemic than subsequently occurred.

As also noted, WHO did not rush to declare a pandemic, but did so only when fully satisfied that all criteria for doing so had been met.

As stated, "no critic of WHO has produced any direct evidence of commercial influence on decision-making." The Committee found "no evidence of attempted or actual influence by commercial interests on advice given to or decisions made by WHO."

The report suggests that WHO responded with insufficient vigour to criticism that questioned its integrity. It is in this spirit that I am responding, hopefully with sufficient vigour, on these two specific points.

Ladies and gentlemen,

As the document clearly states: "The world is ill-prepared to respond to a severe influenza pandemic or to any similarly global, sustained and threatening public health emergency."

We are only three months into this year. But 2011 has already witnessed a cascade of global crises and calamities that have placed unprecedented demands on the international community and its resources. These resources were already stretched thin by the new reality of financial austerity.

I am speaking not only about the devastating triple tragedies in Japan, but also about the health and safety of civilians in a host of hot spots in the Middle East and Africa, including Cote d'Ivoire.

In such a context, recommendations to improve the capacity of WHO and the international community to respond to public health emergencies take on added urgency.

This brings me to my final comment. Apart from the value of the findings, recommendations, and conclusions you have been discussing today, *I believe the report embodies great wisdom*.

I believe it will stand the test of time. I believe it will continue to provide guidance, for different types of emergencies, for WHO and the wider public health community, for many years to come.

Again, let me express my appreciation to members of the Review Committee and your Chair.

I wish you productive deliberative sessions and look forward to reading your final report.

Thank you.

Всемирная организация здравоохранения

Комментарии Генерального директора по оценке ответных мер ВОЗ на пандемию гриппа

Женева, ВОЗ, 28 марта 2009

https://www.who.int/ru/director-general/speeches/detail/director-general-responds-to-assessment-of-who-s-handling-of-the-influenza-pandemic

Замечания на четвертом совещании Комитета по обзору Международных медико-санитарных правил

Ваши Превосходительства, уважаемые члены Комитета по обзору, представители государств-членов, коллеги по системе ООН, представители неправительственных организаций, дамы и господа,

Вслед за вашим Председателем я приветствую вас на этом четвертом совещании Комитета по обзору Международных медико-санитарных правил (ММСП).

Я и мои сотрудники тщательно рассмотрели предварительный документ, который будет представлен и рассмотрен в ходе этой сессии. Мы особо внимательно подошли к трем предварительным выводам и 15 предварительным рекомендациям, содержащимся в этом документе.

С момента начала этого процесса ВОЗ рассчитывала на откровенную, критическую и основанную на фактических данных оценку сильных и слабых сторон ответных мер, которые принимались по мере развития в 2009 году пандемии гриппа.

Мы ожидали руководящих указаний по результатам использования ММСП в ходе этого первого серьезного осуществления их функций. В частности, мы хотели получить критическую оценку результатов деятельности ВОЗ в максимально возможном числе областей и с максимально возможными подробностями.

Прежде всего, мы хотели, чтобы выводы и рекомендации Комитета стали основой для практических шагов. Иными словами, мы хотели получить руководящие указания относительно того, что следует изменить на техническом, управленческом, политическом и даже финансовом уровнях, чтобы повысить качество руководства ВОЗ во время следующей неизбежной эпидемии.

Исходя из предварительного документа и четкой методологии Комитета, я уверена, что в вашем заключительном докладе эти ожидания будут оправданы.

Позвольте мне поблагодарить Комитет и его Председателя д-ра Harvey Fineberg за добросовестный, тщательный и объективный подход и за вашу решимость собрать и критически оценить большой объем фактических данных и заключений экспертов.

Вы выслушали заявления лиц, послужной список и опыт которых сильно различаются, равно как и их взгляды относительно уместности и эффективности ответных мер ВОЗ. Вам был обеспечен неограниченный доступ к полному комплекту внутренних документов ВОЗ.

Как мы все знаем, сегодняшние обсуждения будут сосредоточены на предварительном документе. Затем Комитет подготовит свой заключительный доклад, который будет представлен Всемирной ассамблее здравоохранения в мае.

Я ожидаю услышать ваши мнения.

Комментарии по выступлениям

Благодарю Вас, Председатель, за эту возможность выступить с ответом. Я остановлюсь на некоторых крупных вопросах.

Секретариат подготовил письменный ответ на предварительные выводы Комитета, и этот ответ был представлен Комитету для рассмотрения.

Как я уже отметила сегодня, ВОЗ приветствует предварительный документ, его выводы и рекомендации. Мы приложим максимум усилий, чтобы их осуществить.

Однако позвольте мне быть откровенной. Как отметили некоторые государства-члены, одни ваши рекомендации будет осуществить значительно легче, чем другие.

В целом изменения в области мер политики, практики и приоритетов, всецело относящихся к сфере компетенции ВОЗ и ее руководящих органов, осуществить относительно легко, хотя время, необходимое для их реализации в полном объеме, будет варьироваться, как и потребности в ресурсах.

Например, ваша рекомендация ускорить обеспечение основных возможностей, предписанных ММСП, повторяет прямую просьбу на этот счет, сформулированную на январской сессии Исполнительного комитета. Это является для ВОЗ ясной и неотложной приоритетной задачей.

Как отмечалось, ВОЗ следует значительно лучше управлять потенциальными конфликтами интересов. И мы это уже делаем.

В документе подчеркивается важность гибкости для приспособления к неожиданным и меняющимся условиям и быстрого адаптирования к новым обстоятельствам. Я полностью с этим согласна. Оперативное управление сдерживалось из-за жестких определений и планов.

Понимание серьезности является частью оценки риска любой чрезвычайной ситуации в области общественного здравоохранения. Оно обеспечивает критическое руководство для всех министров здравоохранения, которым необходимо принимать далеко идущие решения, часто влекущие немалые финансовые последствия, в условиях значительной научной неопределенности.

В будущем нам следует лучше управлять этими и другими проблемами, указанными в докладе.

Слабые места в ответных мерах на пандемию, находящиеся вне сферы непосредственной компетенции и непосредственного влияния ВОЗ, устранять сложнее.

Эти слабы места являются следствием более серьезных системных затруднений. Иными словами, они проистекают из особенностей функционирования нашего мира и его международных систем.

Позвольте мне привести один пример. В документе упоминаются затруднения, которые отрицательно сказались на способности ВОЗ добиться своевременного распределения безвозмездных вакцин.

Я лично прилагала энергичные усилия к тому, чтобы все развивающиеся страны имели быстрый доступ, по крайней мере, к некоторым вакцинам. Это произошло недостаточно быстро. Скажу со всей прямотой, что ВОЗ не могла приложить больше усилий, затратить больше энергии и выделить больше сотрудников для решения этой задачи или действовать с большей безотлагательностью.

Препятствия, замедлившие наши темпы, связаны с отсутствием гармонизации в регистрации лекарственных препаратов и вакцин, проблемами ответственности, которые являются элементом политики фирм, и тем простым фактом, что ни одна страна не готова отказаться от своего суверенного права санкционировать маркетинг того или иного медицинского изделия. Другие проблемы были связаны с холодильными цепями.

На мой взгляд, никакой объем заблаговременного планирования не позволит изменить эти реалии или характер функционирования систем.

Дамы и господа,

По моему личному мнению, как руководителя этого учреждения, в ходе оценки ответных мер на пандемию необходимо было рассмотреть два абсолютно критических вопроса и дать всем твердый ответ.

Во-первых, была ли реакция ВОЗ правильной? Была ли это действительно пандемия или нет?

Во-вторых, воздействовали ли на решения, рекомендации и действия ВОЗ каким-либо образом связи с фармацевтической индустрией?

Иными словами, объявила ли ВОЗ ложную пандемию ради обогащения индустрии?

Документ снимает с ВОЗ обвинения по обоим этим пунктам.

Если бы Комитет выявил недостатки в любой из этих двух областей, то такие выводы поставили бы серьезные вопросы относительно нейтральности, авторитетности в технических вопросах и добросовестности Организации.

В докладе нигде не ставится под сомнение решение объявить пандемию. Было отмечено, что исходя из фактических данных, полученных в результате предыдущих вспышек, многие эксперты в ВОЗ и за ее пределами ожидали потенциально более тяжелой пандемии, чем она в итоге оказалась.

Также отмечено, что ВОЗ не поспешила объявить пандемию, а сделала это, лишь убедившись в полной мере, что для этого соблюдены все критерии.

Как было указано, "никакая критика ВОЗ не содержала никаких прямых фактических данных о коммерческом влиянии на принятие решений". Комитет "не нашел никаких свидетельств попыток или фактического влияния коммерческих интересов на высказанные консультативные заключения или решения, принятые ВОЗ".

В докладе высказана мысль о том, что ВОЗ недостаточно энергично реагировала на критику, поставившую под сомнение ее добросовестность. Надеюсь, что моя реакция по этим двум пунктам сегодня является достаточно энергичной.

Дамы и господа,

Как ясно указано в документе, "Мир плохо подготовлен к реагированию на сильные пандемии гриппа или на любые подобные глобальные, длительные и угрожающие общественному здравоохранению чрезвычайные ситуации".

Прошли лишь три месяца этого года. Однако в 2011 году. мы уже стали свидетелями серии глобальных кризисов и бедствий, повлекших беспрецедентную нагрузку на международное сообщество и его ресурсы. Эти ресурсы были и без того крайне напряжены в связи с новыми реалиями строгой финансовой экономии.

Я говорю не только о трех опустошительных трагедиях в Японии, но также о здоровье и безопасности гражданских лиц в целом ряде горячих точек на Ближнем Востоке и в Африке, включая Кот д'Ивуар.

В подобной ситуации рекомендации улучшить способность ВОЗ и международного сообщества реагировать на чрезвычайные ситуации в области общественного здравоохранения становятся еще более актуальными.

Я подхожу к своему заключительному замечанию. Помимо ценных выводов, рекомендаций и заключений, которые вы сегодня обсуждаете, *доклад, по моему мнению, содержит глубокую мудрость*.

Полагаю, что он выдержит проверку временем и будет еще многие годы служить источником руководящих принципов в отношении различных чрезвычайных ситуаций для ВОЗ и для более широкого сообщества общественного здравоохранения.

Позвольте мне еще раз выразить мою признательность членам Комитета по обзору и вашему Председателю.

Я желаю вам продуктивных заседаний и жду вашего заключительного доклада.

Благодарю вас.

EurekAlert! AAAS

Highest prize in public health awarded to Dr. Harvey V. Fineberg
President of the Institute of Medicine
to receive Calderone Prize Grant and Award Announcement

Eurek Alert, AAAA, 17 May 2011
https://www.eurekalert.org/news-releases/532964

New York, NY – May 17, 2011 – Columbia University's Mailman School of Public Health today announced that it will *award the highest prize in public health – the Frank A. Calderone Prize* – to Harvey V. Fineberg, MD, PhD, President of the Institute of Medicine, the health branch of the National Academy of Sciences. The Frank A. Calderone Prize in Public Health, overseen by the Mailman School, is presented to an individual who has made a transformational contribution in the field of public health.

The award recognizes Dr. Fineberg's outstanding work in the fields of health policy and medical decision-making during his long career at Harvard University and later at the Institute of Medicine (IOM). An expert on the impact and broad possibilities of medical innovation and change, he has brought a new awareness and perspective to such issues as how best to roll out new medical technology, how to decide – as individuals and as a society – which treatments to use in complex and risky situations and how to cope with newly emerging illnesses and threatened epidemics.

"Throughout his career, Harvey Fineberg has helped shape our nation's understanding of the importance of disease prevention as a critical component of our health system and the value of investing in high quality public health education to accomplish this. At the Institute of Medicine, he has advanced the goals of improving the quality of medical care and integrating prevention into our nation's health agenda. We are delighted to honor his distinguished work," said Mailman School Dean Linda P. Fried, MD, MPH.

Dean Fried serves with five other public health leaders on the Calderone Prize selection committee. Said committee member Peter Piot, MD, PhD, dean of the London School of Hygiene & Tropical Medicine, of this year's prizewinner: "Dr. Harvey Fineberg has made a lasting impact on public health worldwide through his research on risk and decision-making, his advocacy for prevention, his relentless promotion of human rights, and the training of several generations of public health scholars and practitioners."

Dr. Fineberg will accept the Calderone Prize at the Mailman School gala on October 18, 2011 at the Pierre in New York City. He will give a major address the following day at Columbia's Mailman School. He is the tenth winner of the Calderone Prize, which has been awarded every two to three years since 1992. The $15,000 prize is named for the late Dr. Frank A. Calderone, who was a leading figure in the New York City Department of Health and a pioneering officer of the World Health Organization.

"I am truly honored and humbled by this award and for the extraordinary recognition," said Dr. Fineberg. "It is a privilege to join the distinguished group of past recipients. I am grateful for the opportunity to have worked with so many able colleagues over the years and to continue our collective efforts to help advance the public's health."

Past Calderone Prize winners include C. Everett Koop, MD, ScD, former Surgeon General of the United States; William Foege, MD, MPH, former director of the Centers for Disease Control and Prevention, Mary Robinson, former President of Ireland and U.N. High Commissioner for Human Rights, and Susan Baker, MPH, a pioneering researcher in injury prevention at Johns Hopkins University.

This year's prizewinner, Harvey V. Fineberg, was Provost of Harvard University from 1997 to 2001, following 13 years as Dean of the Harvard School of Public Health. His research has focused on policy development and implementation, assessment of medical technology, evaluation and use of vaccines, and dissemination of medical innovations.

As IOM's president, Dr. Fineberg oversees the efforts of nine boards and 15 standing forums and roundtables engaged in providing objective, expert advice on the nation's most pressing questions about health and health care. Prior to his election, he contributed to IOM's work as chair or member of panels that dealt with health policy issues such as improving HIV/AIDS prevention to policies and regulations that shape the development of new medical technology. Dr. Fineberg also served as a member of the Public Health Council of Massachusetts (1976-1979), as chairman of the Health Care Technology Study Section of the National Center for Health Services Research (1982-1985), and as president of the Association of Schools of Public Health (1995-1996). He helped found and served as president of the Society for Medical Decision Making and recently chaired the World Health Organization's committee to review the functioning of the International Health Regulations and performance during the H1N1 influenza pandemic of 2009.

Dr. Fineberg co-authored the books Clinical Decision Analysis, Innovators in Physician Education, and The Swine Flu Affair. He co-edited books on such topics as AIDS prevention, vaccine safety, and understanding risk in society and authored numerous scientific papers. Among the honorary degrees and awards he has received are the Stephen Smith Medal for Distinguished Contributions in Public Health from the New York Academy of Medicine. He earned his bachelor's and doctoral degrees from Harvard.

WHO's Final Report on the functioning of the International Health Regulations (IHR) in relation to the 2009 A(H1N1) pandemic - the Fineberg report

ECDC comment, 13 June 2011

http://apps.who.int/gb/ebwha/pdf_files/WHA64/A64_10-en.pdf
https://www.ecdc.europa.eu/en/news-events/whos-final-report-functioning-international-health-regulations-ihr-relation-2009-ah1n1

In January 2010 the World Health Organization (WHO's) Executive Board endorsed a proposal from the WHO Director-General to convene a Committee with an independent chair to review the working of the 2005 International Health Regulations (IHR), and the experience gained in the global response to the 2009 influenza pandemic.

Implementation of the International Health Regulations (2005) - Report of the Review Committee on the Functioning of the International Health Regulations (2005) in relation to Pandemic (H1N1) 2009

Report by the Director-General of the World Health Organization (WHO), 64th World Health Assembly (WHA) - Geneva, Switzerland, 5th May 2011

In January 2010 the World Health Organization (WHO's) Executive Board endorsed a proposal from the WHO Director-General to convene a Committee with an independent chair to review the working of the 2005 International Health Regulations (IHR), and the experience gained in the global response to the 2009 influenza pandemic. Effectively this was to review the global handling of the pandemic and what lessons should be learnt. The review of the operation of the new regulations was expected and required in the Regulations themselves. It followed the Regulations being radically different from their predecessors.(1) The review of the handling of the pandemic was a 'lessons learnt' exercise to help modify future responses and so strengthen preparedness for future pandemics. However it also followed criticism of WHO and the global response by bodies like the Parliamentary Assembly of the Council of Europe and specific allegations including that WHO had succumbed to pressures from commercial pharmaceutical companies and that the risk of the pandemic had been over-stated both by WHO and member states.(2) The members of the Committee were persons nominated by Member States and were a mix of experts in public health, emergency response and influenza. Following a protracted process, close examination of WHO itself and much personal and corporate testimony, including from ECDC (3) the review was published and debated by the 64th World Health Assembly in May 2011 where it was adopted.(4) The review is referred to as the *Fineberg* report after its chairman Dr Harvey Fineberg head of the US Institute of Medicine who co-authored a previous report on an influenza incident.(5)

The review committee was given three key objectives:
• Assess the functioning of the International Health Regulations (2005);
• Assess the ongoing global response to the pandemic H1N1 (including the role ofWHO); and
• Identify lessons learned important for strengthening preparedness and response for future pandemics and public-health emergencies.

The Committee conducted most of its work through plenary meetings in Geneva that were open to Member States, the media and the public. The Committee and its working groups also met for deliberative sessions in Geneva, open only to members of the Committee and its immediate support staff. While operating independently, the Review Committee frequently sought information from WHO's Secretariat, asking for clarification of issues that arose during the information-gathering and

report-writing periods. Additionally, the Committee was informed by a remote survey of country general and pandemic preparedness plus a series of briefing notes developed by the WHO Secretariat which provided background on specific issues. These included the IHR, pandemic preparedness, pandemic phases, pandemic severity, pandemic vaccines, antiviral drugs, virological monitoring, disease monitoring, laboratory response, public health measures. In parallel, and of considerable relevance, was an Open-ended Working Group OEWG) of member states on pandemic influenza preparedness: sharing of influenza viruses and access to vaccines and other benefits.(6) In summary, the Committee sought to document WHO's and member states roles and management in response to the pandemic and to evaluate the effectiveness of the IHR in their first few years of use. This required a thorough investigation of events and decisions in the course of the pandemic and an examination of criticisms of the WHO as well as an assessment of its achievements.

The Committee report offers 3 overarching summary conclusions and 15 recommendations for WHO and Member States. These are as follows (many of the recommendations have more detailed sub-recommendations which deserve examination but are not listed here):

Summary conclusion 1

The adoption of IHR 2005 has helped make the world better prepared to cope with public-health emergencies. However the core national and local capacities called for in the IHR are not yet fully operational in member states and are not at present on a path to timely implementation worldwide. Good as the IHR are they lack consequences and sanctions if a member state does not follow them. In some countries the IHR focal point does not even have the authority to convey information to WHO.

- *Recommendation 1*

Member states should accelerate implementation of core capacities required by the IHR.

- *Recommendation 2*

WHO should enhance its Event Information Website.

- *Recommendation 3*

WHO and member states should make decisions on international travel and trade in relation to potential public health emergencies more evidence-based.

- *Recommendation 4*

Member states should ensure that all National IHR Focal Points have the necessary authority and resources to operate effectively.

Summary conclusion 2

WHO performed well in many ways during the pandemic, confronted systemic difficulties but also demonstrated some shortcomings. Because of prior activity by WHO, member states and others three quarters of countries world-wide had pandemic plans by 2009. Specifically the Review Committee found no evidence of malfeasance (wrong-doing) in relation to commercial pressures or influence as alleged by some.(2) Equally the Committee concluded that WHO did not exaggerate the severity of the pandemic but was critical of a number of its communication activities and WHO's handling of its Emergency Committee. It was also critical of member states and WHO spending time counting cases rather that producing rates and analyses. Consequently there were a number of improvements recommended for WHO, the global pandemic response and member states.

- *Recommendation 5*

WHO should strengthen its internal capacity for making sustained responses to emergencies.

- *Recommendation 6*

The mechanism for WHO appointing an Emergency Committee under the IHR should be improved and be made more transparent.

- *Recommendation 7*

WHO should revise its pandemic preparedness guidance in the light of the 2009 experience (while at the same time it must not be assumed that the next pandemic will necessarily resemble 2009 or any other pandemic).(7)

- *Recommendation 8*

WHO should with member states develop measures to assess severity of pandemics but also apply these for seasonal influenza .

- *Recommendation 9*

The management of its guidance documents should be streamlined by WHO.

- *Recommendation 10*

WHO should develop and implement a strategic, organization-wide communications policy.

- *Recommendation 11*

Improved advance agreements for vaccine distribution and delivery should be developed.

Summary conclusion 3

The world is ill-prepared to respond to a severe influenza pandemic or to any similarly global, sustained and threatening public-health emergency. Beyond implementation of core public-health capacities called for in the IHR, global preparedness can be advanced through research, reliance on a multisectoral approach, strengthened health-care delivery systems, economic development in low and middle-income countries and improved health status of the population.

- *Recommendation 12*

A more extensive global, public-health reserve workforce should be established by member states in concert with WHO.

- *Recommendation 13*

There should be a contingency fund for public-health emergencies held outside of WHO but available to WHO in an emergency. .

- *Recommendation 14*

Agreement should be reached on sharing of influenza viruses and access to vaccines and other benefits with the latter built around the GAP programme of WHO.

- *Recommendation 15*

Member states and WHO should continue to pursue comprehensive influenza research and evaluation programmes.

ECDC's listing of Pandemic Evaluations

ECDC Comment (10/06/2011)

As can be seen though the Review Committee cleared WHO of wrong-doing in relationship to pharmaceutical companies, or exaggerating the severity of the 2009 pandemic WHO certainly did not escape criticism. This was especially in the lack of openness over the working of the Emergency Committee and communications in general. It also noted the difficulties that WHO faced in responding to a sustained crisis. At the same time The Review Committee acknowledged that both WHO and all member states faced a most difficult challenge in preparing for and responding to as uncertain a threat as a pandemic. Generally it was noted that plans were set for a severe and lacked flexibility, points noted by ECDC and many European authorities in their reviews.(7) One important development, agreement on virus sharing and benefit sharing has already been agreed and this was endorsed at the 64th World Health Assembly in May.(6) EU authorities are showing leadership since the European Commission has taken the initiative following EU Council encouragement to develop joint procurement procedures with interested member states. At the same time ECDC, working with the European Commission and WHO Regional Office for Europe is leading the revision of the European Pandemic Preparedness Indicators for Member States in the light of the pandemic 2009 experience.(8)

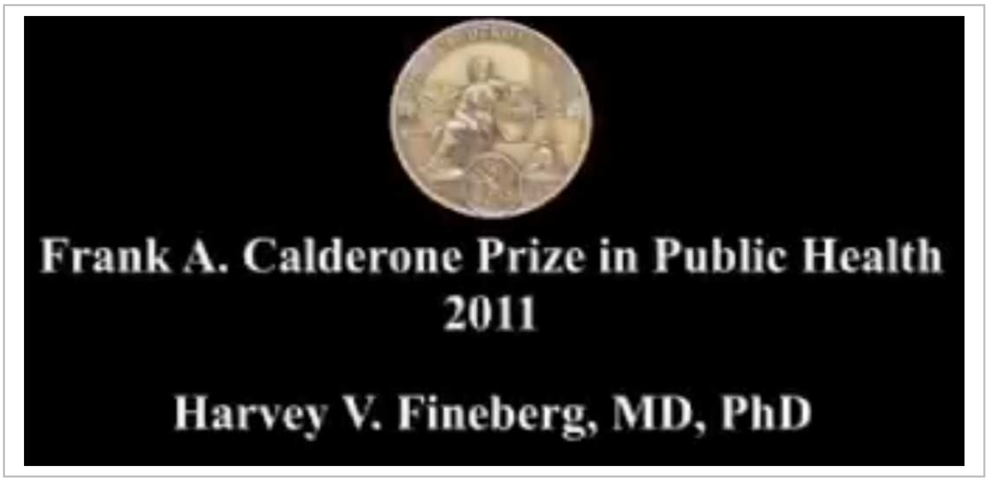
COLUMBIA | MAILMAN SCHOOL OF PUBLIC HEALTH



Frank A. Calderone Prize in Public Health 2011 – 19 October 2011
https://www.youtube.com/watch?v=ZI41tPkwU_o

Columbia University's Mailman School of Public Health awards the highest prize in public health – the Frank A. Calderone Prize – to an individual who has made a transformational contribution in the field of public health. The winner for 2011 is Harvey V. Fineberg, MD, PhD, President of the Institute of Medicine, the health branch of the National Academy of Sciences.

On October 18, 2011 Columbia University's Mailman School of Public Health, awarded Dr. Fineberg the highest prize in public health – The Frank A. Calderon Prize in Public Health.

CISION

Health Care Visionary Dr. Harvey V. Fineberg,
President of the Institute of Medicine,
is named the 2013 winner of the Henry G. Friesen International Prize in Health Research

NewsWire, 8 April 2013, 14:28 ET
https://web.archive.org/web/20210304154919/https://www.newswire.ca/news-releases/health-care-visionary-dr-harvey-v-fineberg-president-of-the-institute-of-medicine-is-named-the-2013-winner-of-the-henry-g-friesen-international-prize-in-health-research-512217931.html

TORONTO, April 8, 2013 /CNW/ - The Prize, established by the Friends of the Canadian Institutes of Health Research (FCIHR) in collaboration with the Canadian Academy of Health Sciences, recognizes exceptional innovation by a visionary health leader of international stature. President Fineberg will receive the Prize and deliver a public lecture on September 18, 2013 in Ottawa. In 2014, he will undertake one or more Institutional visits in Western Canada.

Under Dr. Fineberg's guidance, the Institute of Medicine of the National Academy of Sciences produces 60 to 70 in depth studies per year, many of which address public health practices, medical care, medical education and health policies that guide many agencies of government and other sectors. Dr. Aubie Angel, President of FCIHR, notes that "Dr. Fineberg's public discussions are exceptional in their clarity, objectivity and fundamental soundness".

Harvey V. Fineberg is President of the Institute of Medicine. He served as Provost of Harvard University from 1997 to 2001, following thirteen years as Dean of the Harvard School of Public Health. He has devoted most of his academic career to the fields of health policy and medical decision-making. His past research has focused on the process of policy development and implementation, assessment of medical technology, evaluation and use of vaccines, and dissemination of medical innovations.

Dr. Fineberg helped found and served as president of the Society for Medical Decision Making and has been a consultant to the World Health Organization. At the Institute of Medicine, he has chaired and served on a number of panels dealing with health policy issues, ranging from HIV/AIDS to new medical technology. He also served as chairman of the Health Care Technology Study Section of the National Center for Health Services Research, and as president of the Association of Schools of Public Health.

Dr. Fineberg is co-author of the books *Clinical Decision Analysis*, *Innovators in Physician Education*, and *The Epidemic that Never Was*, the latter an analysis of the controversial federal immunization program against swine flu in 1976. He has co-edited several books on such diverse topics as AIDS prevention, vaccine safety, and understanding risk in society. He has also authored numerous articles published in professional journals. Dr. Fineberg is the recipient of several honorary degrees and the Stephen Smith Medal for Distinguished Contributions in Public Health from the New York Academy of Medicine. He earned his bachelor's and doctoral degrees from Harvard University.

The Henry G. Friesen International Prize in Health Research was established in 2005 by FCIHR in recognition of Dr. Henry Friesen's distinguished leadership, vision and innovative contributions to health and health research. The $35,000 Friesen Prize is awarded annually

Consortium of Universities for Global Health

2014 CUGH Global Health Distinguished Leadership Award

Consorium of Universities for Global Health, June 2014
https://www.cugh.org/our-work/events/past-conferences/global-health-leadership-awards/2014-cugh-global-health-distinguished-leadership-award/

The recipient of the 2014 CUGH Global Health Distinguished Leadership Award was Harvey Fineberg, President of the Institute of Medicine.

Dr. Harvey Fineberg

Harvey V. Fineberg, MD, PhD, is president of the Institute of Medicine (IOM). Following completion of his second term at the IOM at the end of June 2014, he will hold the Presidential Chair on the faculty of the University of California, San Francisco for academic year 2014–2015. Dr. Fineberg served as Provost of Harvard University from 1997 to 2001, following thirteen years as Dean of the Harvard School of Public Health. He has devoted most of his academic career to the fields of health care, public health, and decision-making at the individual level and for policy. His past research has included health policy development and implementation, assessment of medical technology, evaluation and use of vaccines, and dissemination of medical innovations.

Dr. Fineberg helped found and served as president of the Society for Medical Decision Making and has been a consultant to the World Health Organization. He chairs the boards of the Carnegie Endowment for International Peace and the William and Flora Hewlett Foundation and is chair-elect of the China Medical Board. He also serves on the boards of the Josiah Macy, Jr. Foundation and the François-Xavier Bagnoud U.S. Foundation, as well as in a number of advisory capacities, including the National Advisory Committee for the Peterson Institute on Health and the Foresight Committee of the Veolia Environment Institute.

Dr. Fineberg is the recipient of a number of honorary degrees and awards, including the Henry G. Friesen International Prize for Research awarded by the Friends of the Canadian Institutes for Health Research

Dr. Fineberg received another award from Academyhealth on June 8, 2014

GORDON AND BETTY MOORE FOUNDATION

Foundation president Harvey Fineberg awarded honorary doctoral degree

Gordon and Betty Moore Foundation, 8 June 2016
https://www.moore.org/article-detail?newsUrlName=foundation-president-harvey-fineberg-awarded-honorary-doctoral-degree

This week, Ben-Gurion University of the Negev (BGU) awarded foundation president Harvey Fineberg with an honorary doctoral degree at its 46th Board of Governors Meeting in Beer-Sheva, Israel. Harvey received this award for his hard work and vision in the fields of health policy and medical decision-making.

SAN FRANCISCO… June 7, 2016 – Ben-Gurion University of the Negev (BGU) awarded global healthcare visionary Harvey V. Fineberg; M.D., Ph.D., an honorary doctoral degree today at its 46th Board of Governors Meeting in Beer-Sheva, Israel.

Dr. Fineberg has devoted most of his distinguished academic career to the fields of health policy and medical decision-making. His past research focused on the process of policy development and implementation; assessment of medical technology; evaluation and use of vaccines; and dissemination of medical innovations. Fineberg examined, among other subjects, the controversial federal immunization program against swine flu, the adverse effects of pertussis and rubella vaccines, the cost-effectiveness of cardiac care, and the reform of medical education.

Fineberg is the president of the Gordon and Betty Moore Foundation, a U.S. organization that seeks to develop outcome-based projects that will improve the quality of life for future generations.

He held the 2014-2015 presidential chair as visiting professor at the University of California, San Francisco. Prior to that, he served as president of the Institute of Medicine from 2002 to 2014 and as provost of Harvard University from 1997 to 2001, following 13 years as dean of the Harvard School of Public Health. He worked as a practicing physician at two Boston-area health centers from 1974 to 1984.

At the ceremony, BGU President Prof. Rivka Carmi conferred upon him the degree of Doctor Philosophiae Honoris Causa "as a pre-eminent visionary and scientist, dedicated to advancing public health worldwide and whose studies of medical decision-making and health policy have made a lasting global impact. He has demonstrated a profound commitment to human rights and made contributions to the most noble cause of preventing diseases and improving the quality of life for people around the world."

Upon receiving the degree, Fineberg said that "It is a special privilege to receive this degree from Ben-Gurion University of the Negev, which played such a pioneering role in community medicine and population health."

Fineberg chairs the board of the Carnegie Endowment for International Peace and serves on the boards of the William and Flora Hewlett Foundation and the China Medical Board. He helped

found and served as president of the Society for Medical Decision Making and served as a consultant to the World Health Organization.

Fineberg is co-author of the books Clinical Decision Analysis, Innovators in Physician Education, and The Epidemic That Never Was, an analysis of the controversial federal immunization program against swine flu in 1976. He has co-edited several books on such diverse topics as AIDS prevention, vaccine safety, understanding risk in society, and global health. He has also authored numerous articles published in professional journals.

Fineberg is the recipient of several honorary degrees: the Frank A. Calderone Prize in Public Health, the Henry G. Friesen International Prize in Health Research and the Harvard Medal, awarded by the alumni association of the University.

He received a Ph.D. in government from Harvard's Graduate School of Arts and Sciences in 1980, a master's in public policy from the Kennedy School of Government in 1972, an M.D. in 1971 from Harvard Medical School, and a B.A from Harvard College in 1967.

Prof. Harvey V. Fineberg
Honorary Doctorate Recipient at BGU's 46th Board of Governors Meeting

Биотерроризм: национальная и глобальная угроза

Вестник Российской Академии Наук, 2003, том 73, № 3, с. 195-204.
http://vivovoco.astronet.ru/VV/JOURNAL/VRAN/BIOTERROR.HTM

Онищенко Геннадий Григорьевич - академик РАМН, первый заместитель министра здравоохранения, главный государственный санитарный врач.

Сандахчиев Лев Степанович - академик, генеральный директор ГНЦ вирусологии и биотехнологии "Вектор".

Нетесов Сергей Викторович - член-корреспондент РАН, директор НИИ молекулярной биологии ГНЦ вирусологии и биотехнологии "Вектор".

Мартынюк Раиса Александровна - кандидат биологических наук, заместитель генерального директора по координации НИОКР ГНЦ вирусологии и биотехнологии "Вектор".

Угроза биотерроризма, разбуженная 11 сентября 2001 г. атаками на Нью-Йорк и Вашингтон, стала реальностью после того, как в почтовой системе США были скрытно распространены письма с возбудителями сибирской язвы. В результате этой акции умерли пять человек, включая троих, непосредственно контактировавших с зараженной почтой, более 20 были инфицированы и несколько тысяч человек вынуждены принимать сильные антибиотики. Письма, содержащие споры возбудителя сибирской язвы или их имитаторы, обнаружены в десятках других стран, включая Россию. Последний случай инфицирования сибирской язвой через письмо зарегистрирован 31 октября 2001 г. в одном из госпиталей Нью-Йорка [1].

Анализ исторических данных показал, что, как всякий терроризм, биотерроризм имеет политико-идеологические корни. Характер преследуемых целей и задач – борьба за власть и политико-экономическое влияние в современном мире -требует от террористов XXI столетия осуществления глобальных акций, способных самым серьезным образом воздействовать на население и правительства разных стран. В принципе, это тот же террор, только его инструментом служат биологические агенты, среди которых - возбудители особо опасных инфекций. Фактически, меняются форма и масштаб, сущность террора остается прежней.

В истории человечества сохранились сведения о применении биологических агентов во время захватнических войн, следствием чего были опустошающие эпидемии чумы и оспы. Так, в 1346 г. по приказу хана Золотой Орды Тохтамыша в колодцы и другие источники воды в осажденной генуэзской крепости Каффу (нынешняя Феодосия) в Крыму забрасывались трупы людей и животных, погибших от бубонной чумы. В итоге Каффа сдалась, но чума распространилась по всей Европе, вызвав страшную эпидемию, которая унесла жизни 25 млн. человек, что соответствовало примерно 10% населения тогдашнего мира. В 1422 г., в период религиозной войны в Чехии, в битве за Карлштейн тела зараженных чумой солдат бросали в шеренги противника. Подобные эпизоды отмечались и в 1710 г., во время войны России со Швецией. При колонизации Америки среди индейских племен неоднократно распространялась оспа. Например, в 1763 г. белые колонисты вероломно передавали им в знак дружбы зараженные одеяла, что привело к гибели миллионов индейцев, не имевших иммунитета к такому опасному заболеванию, как оспа. Позднее тем же приемом воспользовались британские солдаты для истребления коренного населения Америки [2]. И во время войны Франции и Индии (1754-1767) вирус оспы применялся с целью уничтожения противника [3].

В XX в. развернулись исследования по разработке высокоэффективного химического и биологического оружия для военных целей. Однако, в отличие от химического оружия, в прошлом столетии биологическое оружие использовалось крайне редко. Документально подтверждено лишь применение Японией возбудителей чумы и других бактериальных агентов против Китая в ходе Второй мировой войны [4]. Подписание в 1972 г. конвенции о запрещении биологического оружия значительно уменьшило потенциальную опасность его применения.

Согласно исследованию, проведенному американскими учеными в 1994 г., со времени окончания Первой мировой войны произошло более 244 инцидентов использования биологического и химического оружия [5]. Позднее были идентифицированы еще 110 подозрительных эпизодов, когда террористы или члены криминальных групп использовали, приобретали, угрожали либо проявляли интерес к биологическому оружию [6]. Случаи применения биологических агентов в террористических целях, с точки зрения нынешней трактовки терроризма, единичны. До недавнего времени единственным доказанным случаем считалось заражение салата в барах одного из американских городов в 1984 г., когда в приправу к салатам была добавлена *Salmonella typhimurium* [7].

Эксперты прогнозировали возрастающую угрозу биотерроризма задолго до событий 11 сентября 2001 г. В докладе Службы внешней разведки России за 1993 г. отмечалось:

“Наметившаяся тенденция к широкому распространению биотехнологий (имеющих, как правило, двойное назначение), трудности контроля за производством и применением биологических агентов и токсинов увеличивают вероятность использования биологического оружия (БО) странами «третьего мира» в локальных военных конфликтах, а также в диверсионных и террористических целях” [8].

При этом подчеркивалось преимущество биологического оружия перед ядерным и химическим: имеется возможность нанести серьезный ущерб экономике противника путем изначально скрытого применения биологического оружия против сельскохозяйственных растений и животных. Такие акции могут проводиться и в целях "экономической войны".

Если потенциальные агенты химического оружия хорошо изучены и для большинства из них разработаны методы противодействия, то в отношении биологических агентов ситуация качественно другая. Важно понимать, что биологические агенты действуют не сразу, имеют инкубационный период заболевания, в течение которого носитель может оказаться в совершенно других от первоначального места распространения биологических агентов географических условиях. Случаи подобного рода очень трудно выявить и отличить от природной вспышки, поэтому для доказательства биотеррористической природы вспышки требуется всесторонний эпидемиологический анализ, который может занять много времени. В упоминавшемся нами случае заражения салатов сальмонеллой только через год было доказано, что это - террористический акт, а общественность США узнала об инциденте лишь спустя много лет [9].

Нельзя также забывать, что окружающая нас природа - неисчерпаемый источник микроорганизмов - вирусов, бактерий и грибов, вызывающих заболевания человека, растений и животных. Всемирная организация здравоохранения (ВОЗ) считает инфекционные заболевания второй ведущей причиной смертности и первой причиной преждевременной смертности в мире. Согласно оценкам ВОЗ, ежегодно 2 млрд. людей болеют инфекционными заболеваниями, 17 млн. из которых умирают; ежедневно 50 тыс. смертей являются следствием инфекционных болезней и половина населения планеты находится под угрозой эндемических заболеваний [10].

Имеются и другие причины, по которым биологические агенты могут быть предпочтительными для террористов. Прежде всего это доступность, простота в изготовлении, удобство в хранении и транспортировке, а также возможность скрытого применения. Угроза биотерроризма требует от здравоохранения исключительно высокого уровня готовности к обнаружению наиболее опасных агентов и ликвидации последствий их преднамеренного использования.

В настоящее время ни одна страна не способна в достаточной степени противодействовать биотеррористической угрозе. По мнению ВОЗ, во всем мире система общественного здравоохранения ведет борьбу с естественно возникающими инфекциями на пределе своих возможностей, и дополнительная биотеррористическая угроза может привести к тому, что эта система будет не в состоянии с ней справиться. Уязвимость общества к биологическим агентам объясняется главным образом тем, что система медико-санитарной помощи не способна на данном этапе их своевременно обнаружить и предпринять необходимые меры защиты. Согласно рекомендациям ВОЗ, чтобы повысить готовность общественного здравоохранения к отражению биологической угрозы в той или иной стране, следует сосредоточить усилия на обучении персонала по программе, включающей ограниченную, но правильно выбранную группу биологических агентов. Это позволит создать необходимый потенциал для борьбы с более широким спектром патогенов [12].

Существуют различные списки агентов биологического оружия или потенциально опасных биологических агентов. Исторически потенциальная опасность патогенов оценивалась в интересах военных действий, а не биотеррора. Однако мирное население отличается от военных формирований. Для населения характерны широкий возрастной диапазон и большой разброс в состоянии здоровья, поэтому последствия биологической атаки для него могут быть сильнее, чем для военных формирований. Мирное население более уязвимо к биологическим агентам, содержащимся в питьевой воде и продуктах питания.

На встрече экспертов по инфекционным заболеваниям, проведенной в 1999 г. в Центре по контролю за инфекционными заболеваниями США, были рассмотрены ранее составленные списки потенциально опасных биологических агентов и разработаны общие критерии отбора тех из них, которые представляют наибольшую опасность при биотеррористической атаке. Отобрано около 40 биологических агентов (вирусы или группы вирусов, бактерии, риккетсии, грибы и токсины) и сформированы три категории А, В и С, включающие агенты по степени значимости угрозы для мирного населения [13]. Приводим распределение опасных биологических агентов по категориям [14].

Категория А

Bacillus anthracis (сибирская язва), *Clostridium botulinum* (ботулизм), *Yersinia pestis* (чума) *Variola major* (оспа натуральная) и другие покс-вирусы, *Francisella tularensis* (туляремия) Вирусные геморрагические лихорадки, вызываемые: аренавирусами (ЛХМ вирус, Хунин вирус, Мачупо вирус, Гуанарито, лихорадка Ласса), буньявирусами (хантавирусы, лихорадка долины Рифт) флавивирусами (Денге) филовирусами (Эбола, Марбург)

Категория В

Burkholderia pseudomallei (мелиоидоз), *Coxiella burnetti* (лихорадка Ку), *Brucella species* (бруцеллез), *Burkholderia mallei* (сап), *Ricinus communis* (токсин Рицин), *Clostridium perfringens* (Эпсилон токсин), Стафилококковый энтеротоксин В, *Rickettsia prowazekii* (сыпной тиф).

Патогены, угрожающие пищевой и водной безопасности: Бактерии *(E. coH* - диарея, холерные вибрионы, шигеллиозы, сальмонеллезы, *Listeria monocytogenes* - листериоз, *Campylobacter jejuni* - энтерит, *Yersinia enterocolitica* - энтерит), вирусы *(Caliciviruses,* гепатит А) простейшие *(Cryptosporidium parvum* - диарея, *Cyclospora cayatanensis* - диарея, *Giardia lamblia* - энтерит, *Entamoeba histolytica* -амебиаз, *Toxoplasma* — токсоплазмоз, *Microsporidia* — микроспоридии) дополнительные вирусные энцефалиты (вирус лихорадки Западного Нила, Ла Кросс, Калифорнийский энцефалит. Венесуэльский энцефаломиелит лошадей, Восточный энцефаломиелит лошадей. Западный энцефаломиелит лошадей, вирус японского энцефалита, вирус болезни леса Кьяссанур).

Категория С

Вирусы клещевых геморрагических лихорадок (вирус Конго-Крымской геморрагической лихорадки), Вирусы клещевых энцефалитов, Желтая лихорадка, Устойчивые к лекарствам, формы туберкулеза, Грипп, Риккетсиозы, Бешенство.

В 2002 г. этот список был использован Национальным институтом аллергии и инфекционных заболеваний, одним из ведущих в США в области изучения инфекционных агентов, при разработке краткосрочного и долгосрочного планов исследований по противодействию терроризму. Оценка опасности биологических агентов как средств терроризма против гражданского населения проводилась по следующим критериям:

•высокая заболеваемость и смертность;

• потенциал для непосредственной трансмиссии от человека к человеку либо через переносчика;

• низкая инфекционная доза и высокая инфекционность аэрозоля, способная вызывать большие вспышки;

• способность контаминировать продовольственные и водные ресурсы;

• отсутствие специфических диагностических тестов и/или эффективного лечения;

• отсутствие безопасных и эффективных вакцин;

• потенциал вызывать страх у населения и медицинских работников;

• потенциал для использования в качестве биологического оружия.

Агенты, отнесенные к категории А, представляют наибольшую угрозу для мирного населения. Их применение может привести к массовым жертвам, а некоторые из них, например оспа и чума, способны поставить под угрозу функционирование всего государства. Вирус натуральной оспы считается самым опасным из-за своих патогенных и эпидемических свойств [15]. За всю историю человечества оспа унесла около полумиллиарда человеческих жизней - больше, чем войны и прочие эпидемии вместе взятые [2].

Большинство предпринимаемых ныне мер ориентированы на защиту мирного населения именно от агентов, относящихся к категории А. Однако необходимо помнить, что в качестве биологического оружия можно использовать и обычные микроорганизмы, например, сальмонеллы, легионеллу или вирус гриппа, которые способны надолго вывести из строя большую часть населения страны, подорвать экономику государства. К такому выводу исследователи пришли на основе изучения пяти вспышек инфекционных болезней, недавно имевших место в различных странах. Санитарно-эпидемиологические службы и органы здравоохранения этих стран не смогли адекватно отреагировать на резкий прирост заболеваемости [16].

Крайне опасно использование в террористических целях агентов "возникающих инфекций". По оценкам экспертов, нам известно не более нескольких процентов существующих вирусов и чуть большая доля бактерий, а природа постоянно создает новые патогены. Только за последние 40 лет открыто и идентифицировано более 30 новых инфекционных агентов, среди которых ВИЧ, вирусы Марбург и Эбола. Для этих заболеваний не разработаны средства лечения и профилактики. Ряд возникающих и вновь появляющихся патогенов, таких как вирус Западного Нила, лекарственно устойчивые *Streptococcus, Staphylococcus* и *Mycobacterium tuberculosis,* также могут быть опасными биологическими агентами [9].

Значительную угрозу представляют и химерные организмы, сконструированные с помощью простых генетических манипуляций. На конференции, прошедшей в Бельгии в ноябре 2001 г., ученые пришли к выводу, что пандемию гриппа можно вызвать искусственным путем. По мнению доктора Р. Бебстера - директора Сотрудничающего центра ВОЗ по изучению экологии гриппа у животных и птиц - террористы вполне могут инициировать вспышку гриппа. Возможности современной биотехнологии позволяют создать вирус гриппа того типа, который наблюдался в 1919 г. и вызвал многомиллионные смерти во всем мире [17]. В противовес этим угрозам должны быть разработаны методики выявления таких искусственно созданных агентов и специфические средства для профилактики и лечения вызываемых ими заболеваний.

* * *

Возрастание угрозы применения биологического оружия террористами и масштабы возможного воздействия биологических агентов на гражданское население заставили правительства разных стран и международные организации готовить планы ответных мер, находить способы

пресечения биотеррора. В середине 2001 г. обнародованы черновые материалы - рекомендации ВОЗ "Ответные меры системы общественного здравоохранения на угрозу применения биологического и химического оружия" [12]. В составлении этого документа принимали участие ведущие ученые разных стран.

В документе основное внимание уделено национальным планам противодействия терроризму. Национальное здравоохранение должно быть готово обнаружить и ликвидировать последствия вспышки любого биологического агента, включая традиционные и экзотические виды микроорганизмов. Существующие системы государственного эпидемиологического надзора и борьбы с инфекционными болезнями должны быть способны выявлять, локализовать и ликвидировать вспышку инфекционного заболевания независимо от того, следствие ли она естественного проявления природного патогена или результат его преднамеренного использования. Несомненно, что национальные планы противодействия биотерроризму должны входить составной частью в планы по борьбе со вспышками инфекционных заболеваний, химическими и радиологическими инцидентами.

В рекомендациях ВОЗ отмечается, что вводимые в практику методы обнаружения биологических агентов, базирующиеся на молекулярных технологиях, нуждаются в повышении чувствительности, быстроты и точности. Для обеспечения должного уровня профилактических мероприятий нужны новые безвредные и эффективные вакцины, созданные современными методами биотехнологии.

Необходимость дальнейшего развития медико-биологических исследований подчеркивается и в стратегическом плане, разработанном Национальным институтом аллергии и инфекционных заболеваний США уже после событий сентября 2001 г. В нем отмечается, что возможности выявления и предотвращения инфекций как последствий биотеррористических актов в немалой степени зависят от уровня фундаментальных и прикладных медико-биологических исследований.

США готовились к противодействию биотерроризму с середины 90-х годов прошлого века. В июне 1995 г. была издана секретная директива президента США, предусматривающая повышение готовности страны на случай совершения терактов, в том числе биологических. В мае 1998 г. началась разработка всеобъемлющей стратегии борьбы с биотерроризмом. В 2000 г. Центр по контролю за инфекционными заболеваниями США публикует Национальный стратегический план по готовности к действиям в случаях биологического и химического терроризма [18]. План предусматривает координированное участие в выявлении и ликвидации инцидентов более десяти различных организаций. Основные разделы плана: профилактика; надзор; диагностика биологических и химических агентов; принятие мер по ликвидации инцидента; система оповещения и информационного обеспечения. Предполагается обучение персонала, эффективный санитарно-эпидемиологический надзор и обеспечение готовности всех участников к обнаружению и ликвидации последствий возможного применения химических и биологических агентов. Ключевым моментом плана является создание в США многоуровневой сети диагностических лабораторий для быстрого обнаружения, идентификации и оповещения служб здравоохранения территорий, штатов, районов и городов о выявленных агентах биологической и химической природы. План ориентирован на модернизацию существующих структур по борьбе с инфекционными болезнями, прежде всего на местном уровне.

В планах ВОЗ и Центра по контролю за инфекционными заболеваниями США предлагаются меры, направленные на совершенствование клинической базы и подготовку медицинского персонала. Медики должны хорошо представлять текущую эпидемическую ситуацию, знать потенциальные биологические агенты и симптоматику инфекционных заболеваний, нередко отличающуюся от естественно возникающих заболеваний. Они должны овладеть средствами лечения и способами предотвращения эпидемий. Особое внимание в этих планах уделено созданию системы мониторинга за необычными случаями заболеваний.

В 1999 г. на борьбу с биотерроризмом различным ведомствам США были выделены значительные средства. Началась реализация программ по созданию запасов 18 новых вакцин, включая новые вакцины против оспы, запасов медикаментов и антибиотиков, предназначенных в первую очередь для полиции, пожарных и медицинских работников. Проведен ряд учений, моделирующих использование террористами в крупных городах особо опасных инфекционных агентов - чумы, сибирской язвы, оспы [19-21].

К сентябрю 2001 г. США отнюдь не считали себя неподготовленными к террористическим актам с применением биологического и другого оружия массового уничтожения. Вместе с тем оказалось, что система здравоохранения США не располагает реальными возможностями, необходимыми для быстрой обработки большого числа жертв, не имеет достаточных площадей изоляторов, где должны размещаться инфекционные больные. Кроме того, врачи не сразу сумели поставить правильный диагноз сибирской язвы. Так, случай заражения грудного младенца в Нью-Йорке был подтвержден только через полторы недели после появления первых симптомов [1]. Обнаружилось, что наборы медицинских средств борьбы с инфекцией - диагностические тест-системы, вакцины и терапевтические лекарства – устарели, а их запасы недостаточны.

Сентябрьские события 2001 г. вызвали страх и панику среди населения, напуганного не только самим фактом биотерроризма, но и неготовностью здравоохранения, демонстрировавшего признаки перенапряжения даже при малочисленных случаях заражения сибирской язвой. Очевидно, что выбор биологического агента и способа его распространения в большей степени имел целью оказать психическое воздействие на общество, чем вызвать крупномасштабную эпидемию. И цель была достигнута. Недостаток правдивой, объективной и профессионально поданной информации об используемой террористами бактериальной рецептуре, ее поражающем действии и способах профилактики усугубил панику.

Многие страны, осознав реальную возможность применения биологических агентов террористами, предприняли определенные шаги и в области совершенствования законодательной базы. В частности, были внесены поправки в уже существующие законы, ужесточающие наказание за терроризм. В США в январе 2002 г. подписан Закон о терроризме. В июне 2002 г. принят Закон о защите здоровья населения и реагировании на биотерроризм, направленный на улучшение работы портовых инспекций, защиту продовольственных поставок, контроль биологических материалов и расширение возможностей реагирования системы здравоохранения на серьезное нападение [22, 23]. После подписания этих законов на борьбу с биотерроризмом выделили дополнительно 2.9 млрд. долл. В федеральном бюджете на 2003 финансовый год на эти цели предлагается выделить уже 5.9 млрд. долл. - в три раза больше, чем в 2002 финансовом году. Почти половина этих средств (2.4 млрд. долл.) будет направлена на развитие фундаментальных и прикладных исследований, призванных обеспечить США медицинскими средствами, которые требуются для эффективного ответа на вызов террористов [24].

В России начиная с 1997 г. предпринимаются меры противодействия биотерроризму. Создана Межведомственная антитеррористическая комиссия РФ, для решения оперативных вопросов образована секция по биотерроризму, включающая в себя специалистов многих министерств и ведомств. В 1999 г. по инициативе Минздрава России на уровне Межведомственной антитеррористической комиссии РФ была представлена концепция деятельности государственных органов власти при возникновении чрезвычайных ситуаций, вызванных терактами с применением биологического и химического оружия. В том же году утверждена Федеральная целевая программа "Создание методов и средств защиты населения и среды обитания от опасных и особо опасных патогенов в чрезвычайных ситуациях природного и техногенного характера на 1999-2005 гг." (нынешнее ее название - "Защита от патогенов"). В ней определены следующие приоритеты: фундаментальные исследования патогенов, прогнозирование вспышек инфекционных заболеваний, специфическая индикация и диагностика, профилактика и лечение, защита от патогенов (средства и методы обеззараживания). Создан Центр специальной

лабораторной диагностики и лечения опасных и экзотических инфекций, организован Федеральный межведомственный центр подготовки специалистов, испытания средств и методов индикации возбудителей особо опасных инфекций [19,25].

После событий осени 2001 г. в нашей стране подготовлен проект поправок к Закону "О борьбе с терроризмом", ряд министерств ведет работу над Концепцией биологической безопасности России [26]. Российская академия медицинских наук и Минздрав России разрабатывают программу, предусматривающую план действий по оказанию населению медицинской и психологической помощи в связи с возможными угрозами биотерроризма. В план включена специальная подготовка медицинского персонала и обучение населения методам защиты от угрозы биотерроризма [27].

Большую актуальность приобретает созданная еще в 2000 г. национальная Программа фундаментальных и прикладных исследований вируса оспы. Нынешнее поколение врачей не имеет опыта в диагностике и лечении этой инфекции, отсутствуют современные диагностикумы, лечебные препараты, ограничен запас вакцин [28]. Минздрав России подготовил Концепцию возобновления вакцинации против оспы, которая в 2002 г. внесена на рассмотрение правительства.

В России значительная часть научно-организационных мер противодействия биотерроризму проводится в рамках существующей системы борьбы с инфекционными заболеваниями. Основные задачи этой системы:

• повышение эффективности эпидемического надзора за инфекционными заболеваниями на основе повсеместного использования компьютерных информационно-аналитических систем, мониторинга состояния окружающей среды и коллективного иммунитета населения;

• развитие нормативной и методической базы в области профилактики инфекционных заболеваний;

• реализация федеральных и региональных программ по обеспечению санитарно-эпидемиологического благополучия населения;

• совершенствование системы вакцинопрофилактики инфекционных заболеваний;

• расширение информационно-пропагандистской системы по соблюдению населением мер личной и общественной профилактики инфекционных болезней;

• укрепление материально-технической базы лабораторий лечебно-профилактических учреждений и центров Госсанэпиднадзора, оснащение их необходимым оборудованием, внедрение современных методов индикации возбудителей инфекционных заболеваний (ПЦР и др.);

• активизация научных исследований в области диагностики, эпидемиологии, лечения и профилактики инфекционных заболеваний [25].

Готовность к возможным актам биотерроризма удается повысить, если в крупных региональных центрах, особенно там, где есть международные аэропорты, будут постоянно функционировать инфекционные больницы, оборудованные с учетом должного уровня биозащиты (не ниже Р-3). На том же уровне биобезопасности следует оборудовать региональные клинико-микробиологи-ческие и иммунологические лаборатории, которые должны сотрудничать с инфекционными больницами и соответствующими НИИ.

Комплекс мер противодействия угрозе биотерроризма, дополняя уже существующую систему борьбы с инфекционными заболеваниями, призван усовершенствовать структуру здравоохранения, повысить уровень биомедицинских исследований, а также улучшить взаимодействие с другими министерствами и ведомствами, учреждениями Госсанэпиднадзора и НИИ соответствующего профиля. * * *

После событий осени 2001 г. еще очевиднее стала необходимость усиления международного сотрудничества в деле борьбы с угрозой биотерроризма. Консолидация усилий государств в этой борьбе ведется на различных уровнях.

В ноябре 2001 г. президенты России и США приняли совместное заявление, в котором отмечается, что обе страны будут вести совместную работу по противодействию угрозе биотерроризма. Стороны заявили о приверженности Конвенции 1972 г. о запрещении разработки, производства и накопления бактериологического, биологического, токсинного оружия и его уничтожении [29].

В ноябре 2001 г. США и шесть других стран присоединились к Оттавскому плану, предусматривающему усиление международного сотрудничества в предупреждении биологических терактов. Страны договорились налаживать совместное сотрудничество в обеспечении вакцинами и антибиотиками; участвовать в конструктивном диалоге по унификации нормативно-правовой базы создания вакцин, в частности, вакцин против оспы; оказывать дальнейшую поддержку существующей сети ВОЗ по наблюдению за заболеваниями и ее усилиям по выработке согласованной стратегии сдерживания вспышек заболеваний. Предполагается обмениваться планами подготовки к чрезвычайным ситуациям и ликвидации их последствий; рассматривать возможности совместной подготовки кадров; организовать обмен данными наблюдений национальных медицинских лабораторий и информацией о реальном или грозящем заражении продовольствия, стратегиями безопасного продовольственного снабжения [30].

Тема объединения усилий по противодействию терроризму обсуждалась на состоявшемся в мае 2002 г. в Москве рабочем совещании, на котором присутствовали представители американских и российских министерств иностранных дел, обороны, здравоохранения, науки [31]. Вопрос о принятии общественным здравоохранением ответных мер при умышленном использовании биологического, химического или радиологического оружия был рассмотрен в мае 2002 г. на 55-й Всемирной ассамблее здравоохранения. Секретариат ассамблеи отметил важность борьбы с возникающими в природных условиях эпидемиями, например, с лихорадкой Эбола. Особое внимание было уделено мерам защиты воды и продуктов питания от заражения химическими и биологическими агентами [33].

В мире имеются ресурсы для борьбы с инфекционными болезнями, и эти ресурсы могут быть использованы для противодействия биотерроризму. В 1997 г. на базе национальных центров и лабораторий, сотрудничающих с ВОЗ, была создана международная сеть по сбору данных и контролю за вспышками наиболее опасных заболеваний. Действуют сотни центров ВОЗ, специализирующихся по отдельным инфекциям, сеть лабораторий Панамериканской организации здравоохранения, Международная сеть клинической эпидемиологии, сеть институтов Пастера, сеть исследовательских центров Национального института здравоохранения США, в которую вовлечены и университеты [9].

В наши дни большое внимание уделяется созданию автоматизированных систем эпидемического обнаружения и реагирования. В США уже внедрены несколько систем для улучшения надзора как за инфекционными заболеваниями, так и за выявлением случаев биотерроризма в крупных городах. Так называемая Система усовершенствованного эпидемиологического обнаружения и экстренного реагирования функционирует в 79 госпиталях [33]. Разработана автоматизированная система для учета информации, полученной при амбулаторном посещении больных и во время телефонных разговоров [34].

Существенную помощь в анализе различных эпидемических ситуаций могут оказать современные геоинформационные системы, или ГИС-технологии. Первые исследования в области эпидемиологии, проведенные в России с применением ГИС-технологий, показали, что с их помощью можно изучать закономерности распространения инфекционных заболеваний, прогнозировать их развитие, анализировать последствия актов биотерроризма [35].

По традиции для ликвидации очагов заболевания используются созданные под эгидой ВОЗ специализированные команды (эпидотряды). Они ликвидировали эпидемические вспышки геморрагической лихорадки Марбург в Конго в 1999 г., энцефалит, вызванный вирусом *Nipah,* в Малайзии в 1999 г., лихорадку Рифт-Вэлли в Саудовской Аравии в 2000 г., желтую лихорадку в Либерии в 2001 г. [36].

Чтобы повысить эффективность борьбы с инфекционными заболеваниями, Д. Хендерсон - главный советник по науке министра здравоохранения и социального обеспечения США, предлагает организовать сеть из 15 региональных центров. Они должны располагать: клиническими амбулаторными службами по инфекционным болезням; исследовательскими диагностическими лабораториями; эпидотрядами на правах службы эпидемиологической разведки, обеспечивающими контроль за регионом, в котором проживают 2-5 млн. человек; образовательно-тренировочной базой для подготовки национального и международного персонала. Эта сеть должна взаимодействовать с такими организациями, как Центр по контролю за инфекционными заболеваниями США, Национальный институт аллергических и инфекционных заболеваний США и с другими центрами. Для обеспечения легитимности и стабильной работы региональных центров необходима их тесная связь с ВОЗ и государственными структурами стран, в которых они находятся [9].

В настоящее время идет работа над организацией единого Европейского центра по инфекционным заболеваниям, который начнет функционировать в 2005 г. Подобно Национальному центру инфекционных болезней США, европейский центр будет координировать научно-исследовательские работы, осуществлять надзор за инфекционными заболеваниями, проводить профессиональное обучение. Предполагается, что новый центр поможет оптимизировать деятельность уже существующих в Европе национальных структур, таких как Институт Пастера (Франция), Каролинский институт (Швеция), Институт им. Роберта Коха (Германия), и повысить готовность Европы противодействовать угрозе биотерроризма [37].

В России уже функционирует уникальная система, предназначенная для борьбы и надзора за инфекционными заболеваниями, которой нет нигде в мире, - Государственная санитарно-эпидемиологическая служба: 89 региональных и 1700 центров районного уровня. Есть система противочумных институтов, включающая 5 НИИ, 11 станций и 14 отрядов, работающих на территории природных очагов [38].

Учитывая зарубежный опыт, представляет интерес идея создания и в России региональных центров по борьбе с инфекционными заболеваниями на базе существующих научно-исследовательских центров и институтов данного профиля. Под руководством Минздрава России эти региональные центры могли бы выполнять программы, ориентированные на выявление и ликвидацию природных или террористических вспышек инфекционных заболеваний в своем регионе. Территориальное разграничение зон действий таких центров должно в первую очередь предусматривать экономическую и геополитическую значимость региона для национальной безопасности России. В дальнейшем российские региональные центры могли бы войти в международную систему биологической безопасности [9].

Успешное противодействие биологическому и химическому терроризму невозможно без объединения усилий различных ведомств, например, Минобороны и Минздрава России, РАМН, РАН, РАСХН. Накопленный этими ведомствами опыт может послужить основой для создания национальной системы противодействия террористическим актам. Заслуживает внимания Система мониторинга особо опасных малоизученных, экзотических, в том числе зооантропонозных заразных болезней животных, разработанная в Минсельхозе России [39].

Несомненным условием обеспечения биологической безопасности России является достаточное и стабильное государственное финансирование фундаментальных и прикладных биомедицинских исследований, направленных на разработку диагностических и лечебно-профилактических средств нового поколения [40]. На VIII съезде эпидемиологов, микробиологов и паразитологов, проходившем в Москве в марте 2002 г., была подчеркнута необходимость кардинального расширения научно-исследовательских и опытно-конструкторских работ в следующих направлениях:

• новые ускоренные методы и средства индикации возбудителей инфекционных заболеваний, создаваемые на основе перспективных разработок в области биотехнологии и нанотехнологий;

• вакцины нового поколения, живые рекомби-нантные вакцины на базе вирусных векторов, разрабатываемые с использованием методов генной инженерии, живых поливалентных противовирусных вакцин, ДНК-вакцин;

• новые химические субстанции и рецептура новых дезинфицирующих препаратов [25].

Следует также продолжить поиск, испытания и организацию производства более эффективных препаратов для лечения инфекционных заболеваний. Дальнейшее изучение молекулярного разнообразия и молекулярной изменчивости инфекционных агентов позволит не только проводить быструю идентификацию вызвавших вспышку разновидностей инфекционных агентов, но и прогнозировать возникновение новых патогенов на основе естественной их эволюции или путем скрытых работ биотеррористов по направленному искусственному изменению их свойств.

В заключение считаем необходимым еще раз подчеркнуть, что способность государства противодействовать угрозе биотерроризма - одному из факторов риска появления и распространения инфекционных заболеваний - определяется состоянием и подготовленностью системы здравоохранения к обнаружению, локализации и ликвидации вспышек инфекций независимо от происхождения вызвавших их патогенов; уровнем проводимых фундаментальных и прикладных исследований, направленных как на молекулярно-эпидемиологическое изучение патогенов, так и на создание средств диагностики, профилактики и лечения, требуемых для предотвращения вспышек заболеваний или их ликвидации. И безусловно, успешной борьбе с биотерроризмом будет способствовать вхождение России в зарождающуюся международную систему биологической безопасности.

Выражаем признательность Т.Ю. Иванькиной и М.И. Кисуриной за помощь в подготовке материала и оформлении настоящей статьи.

U.S. NORTHERN COMMAND

Gail Braymen, Sgt. 1st Class

USNORTHCOM contributes pandemic flu contingency planning expertise to trilateral workshop

NORAD and USNORTHCOM, 14 April 2008
https://www.northcom.mil/Newsroom/News/Article/Article/563546/usnorthcom-contributes-pandemic-flu-contingency-planning-expertise-to-trilatera/

Peterson Air Force Base, Colo. – Rules, regulations and red tape can make traveling from one country to another tedious and time-consuming for people. Diseases, on the other hand, can cross borders without passports, visas or even reservations.

That ease of movement, combined with modern transportation that can move people from one hemisphere to another in a matter of hours, has made dealing with a potentially international pandemic a major concern of the United States – South Korea – Japan Trilateral Workshop. The latest workshop, held earlier this year on South Korea's Jeju Island, was the fourth in a series that was first hosted in Tokyo in 2006.

U.S. Northern Command, at the request of the Institute for Defense Analyses, has participated in the Trilateral Workshop since the beginning, contributing its expertise in pandemic influenza contingency planning, among other subjects. Army Brig. Gen. Robert Felderman, deputy director of USNORTHCOM's Plans, Policy and Strategy Directorate, attended the Jeju Island workshop and presented a briefing on the command's pandemic influenza plan.

"USNORTHCOM is the global synchronizer – the global coordinator – for pandemic influenza across the combatant commands," Felderman said. "Also, the United States in 1918 had the Spanish influenza. We were the ones who had the largest response to in more recent history. So I discussed what we did then, what we expect to have happen now and the numbers that we would expect in a pandemic influenza."

The potential number of fatalities in the United States in a modern pandemic influenza could reach nearly two million, according to Felderman. Not only would the nation's economy suffer, but the Department of Defense would still have to be ready and able to protect and defend the country and provide support of civil authorities in disaster situations. While virtually every aspect of society would be affected, "the implications for Northern Command will be very significant."

"[A pandemic would have] a huge economic impact, in addition to the defense-of-our-nation impact," Felderman said.

The United States isn't alone in preparing for such a potential catastrophe.

"[The workshop organizers] wanted pandemic influenza to be the focal point for this meeting because it's something that all three nations have in common, and all three nations are in the planning

phase for this," said David Koster, deputy chief of the Joint Readiness Division in the North American Aerospace Defense Command and USNORTHCOM Training and Exercise Directorate. "That kind of shared experience serves as a common denominator, and it really does help break the ice because it gives everyone something very familiar to discuss."

Koster, who has attended three of the four Trilateral Workshops, said that, despite the cultural, political and functional differences among the three participating countries, their solutions to problems are often surprisingly similar.

"The structure of the workshop was that questions were posed by the facilitators, and the three nations split off into three different teams to discuss and find their unique solution to the problem that's been posed," Koster explained. "When we'd come back together and brief our answers, we'd often find that the Japanese or the Koreans, or perhaps both, had the same solutions as we did. So the differences in the cultures were often superseded by the issues at hand."

The workshops not only give representatives from the three countries the opportunity to brainstorm answers to hypothetical questions, but to learn more about each other.

"It gives us a good understanding of the other nations – of governments and what sort of processes they have to go through, and their bureaucracy compared to our bureaucracy," Koster said.

The four Trilateral Workshops in the past two years have also laid the groundwork for more permanent, ongoing working groups scheduled to be established this year. And the three countries plan to interact and communicate more actively.

"We're intending to share experiences by sending observers to each other's exercises." Koster said. "We're also intending to create a trilateral portal that will allow us to collaborate electronically. And that's brand-new, a result of the discussions at these workshops."

U.S. Northern Command was established on Oct. 1, 2002, to anticipate and conduct homeland defense and civil support operations within the assigned area of responsibility to defend, protect, and secure the United States and its interests.

Пандемия «испанки» 1918-1920 гг. в контексте других гриппозных пандемий и «птичьего гриппа»

Supotnitskiy.ru, 29 апреля 2009
https://www.supotnitskiy.ru/stat/stat51.htm

Ведение

Завершившаяся шумная и дорогостоящая кампания борьбы с «птичьим гриппом», который должен был перейти в «испанку, да так почему-то и не перешел, требует подведения некоторых итогов. В этой статье сделана попытка объяснить феномен «испанки» в контексте других пандемий гриппа и исследованы научные предпосылки возможности ее возвращения в связи с эпизоотиями гриппа среди птиц.

...

Прежде чем перейти к описанию пандемии гриппа 1918-1920-х гг., попробуем на основе приведенных выше данных сделать *некоторые обобщения*.

1. Большинство зафиксированных в исторических источниках пандемий гриппа имели двух- или трехволновый характер и не сопровождались большой смертностью населения. Например, пандемии 1780-1782, 1830-1833 и 1889-1892 гг.

2. «Возвращение» пандемий, сопровождающихся значительной смертностью населения (т. е. обращавшей на себя внимание врачей как «тяжелых»), происходило в периоды времени в 100 и более лет, за которые менялось четыре-пять поколений людей. Например, пандемии 1580, 1729-1730 и 1836-1837 гг. (см. табл. 1).

3. Смертность населения от гриппа (количество погибших на 100 или 100 тыс. заболевших) не зависит от масштабов пандемии. Обычно большое число погибших имеет место во время вспышек, привязанных к отдельным местностям и/или этническим группам. Например, вспышки гриппа в Сибири в 1843 г. и 1858-1859 гг. смертельными были только для отдельных народностей; пандемия 1729-1730 гг. наиболее тяжелые осложнения дала в Соединенном Королевстве и Италии.

4. Гибель людей во время пандемий и вспышек гриппа имела место на фоне осложнений со стороны органов дыхания (пневмонии, плевриты, абсцессы), поражения ЦНС (помрачение сознания, энцефалиты, гипертермия и др.), нарушения гемодинамики (обычно описывается врачами как «нарастающая слабость») и системы свертывания крови (петехии, кровотечения и кровоизлияния различной локализации). За время одной пандемии на разных территориях и в разных этнических группах характер таких осложнений был различным (например, у бурят и русских во время вспышек гриппа в Сибири в 1858-1859 гг.).

5. «Скорость» распространения гриппа по планете во время масштабных пандемий прошлого, практически не отличалась от той, которую приписывают современным пандемиям, объясняя это явление возросшей способностью человека к перемещениям (например, пандемии 1780-1782, 1847-1847, 1889-1892 гг.; и пандемии «испанки», Азиатского гриппа или Русского гриппа).

...

2. Пандемия гриппа 1918-1920-х гг. («испанка»)

После пандемии 1889-1892 гг. и, даже, во время Первой мировой войны, грипп появлялся сравнительно редко. Новая пандемия, названная «испанской болезнью», началась уже в конце войны - в 1918 г. Место появления ее точно установить пока невозможно, но, во всяком случае, не Испания была первичным эпидемическим очагом.

Название «испанка» появилось случайно. Так как военная цензура обеих борющихся сторон не допускала сообщений о начавшейся в армии и среди населения эпидемии, то первые известия о ней появились в печати в мае-июне 1918 г. в нейтральной Испании.

...

Некоторые обобщения по «испанскому гриппу».

1. Пандемия «испанского гриппа» развивалась как и большинство других пандемий гриппа прошлого, с характерными тремя волнами заболеваемости, и с той же «скоростью», но по тяжести клиники болезни и характеру осложнений она напоминала пандемию 1836-1837 гг.

2. Наиболее опасными осложнениями гриппа в эту пандемию, обычно наблюдающихся у молодых людей, были быстро нарастающее поражение сердечно-сосудистой системы, резкое падение кровяного давления, помрачение сознания, геморрагические явления, развивающиеся у больных даже раньше, чем осложнения со стороны легких.

3. Молодой возраст погибших нельзя объяснить только тем, что люди старших возрастов переболели гриппом в пандемию 1889-1892 гг., так как серотип вируса, вызвавший эту пандемию (N2H2), не совпадает с серотипом вируса, вызвавшим пандемию «испанки» 1918-1920 гг. (N1H1).

4. Пандемическое распространение, клинику и патанатомию «испанского гриппа» нельзя объяснить результатами расшифровки генома вируса гриппа, вызвавшего «испанку», так как они не показали отличий генов «вирулентности» вируса «испанки» от штаммов вируса гриппа, циркулирующих среди людей сегодня.

5. Вирус, вызвавший пандемию гриппа 1918-1920 гг., таксономически находится на границе между семействами вирусов гриппа человека и свиней, и вне группы птичьих вирусов, что предполагает наличие у негоальтернативного хозяина.

...

Обобщения по разделу.

1. При всей опасности вируса гриппа птиц для птицехозяйств, *не было никаких научных оснований* утверждать, что он, образовав рекомбинант (реассортант) с вирусом гриппа человека, вызовет «испанку», которая унесет «от 5 до 150 млн. жизней на планете».

2. В основе информационной кампании по «борьбе с птичьим гриппом» лежало сокрытие, *подлог и агрессивное искажение информации*.

3. Ни один крупный российский эпидемиолог (даже в ранге академика РАМН) *не выступил против профанации проблемы гриппа* в 2004-2006 гг., что является очень тревожным индикатором состояния научной этики в России вообще, и самой эпидемиологии, в частности.

Странные противоречия в подсчете количества жертв свиного гриппа в Мексике.

"По последним данным, 103 человека скончались от свиного гриппа в Мексике, 1614 госпитализированы с симптомами болезни" [Число жертв свиного гриппа в Мексике превысило 100 человек. – Newsru, 27 апреля 2009 г., 08:58ж https://www.newsru.com/world/27apr2009/flu.html]

"В Мексике количество официально подтвержденных случаев заболевания свиным гриппом выросло на 23 человека до 49 больных". [В Мексике свиным гриппом заражены уже 49 человек. – KM.ru, 29 апреля 2009, 18:35: https://www.km.ru/news/v_meksike_svinym_grippom_zarazhe]

Откуда тогда взялись "*по последним данным* ...", которыми запугивали нас 26-27 апреля, обваливали биржи и т. п.?

Академик Львов 28.04.09 г. заявил, что "предвидел" все, что происходит сегодня с гриппом. Читаем его "предвидение": "По мнению ученого, при смешении вирусов гриппа птицы и человека может возникнуть новый опасный гибрид..." [Академик Дмитрий Львов: "Птичий грипп" в тысячи раз опаснее атипичной пневмонии". – Регнум, 10 февраля, 2004, 00:04 https://regnum.ru/news/215451]

И еще: "По мнению Львова, пандемия гриппа скорее всего будет вызвана мутацией вируса так называемого "птичьего" гриппа (H3N2), сообщает ИТАР-ТАСС. ...

"Существует стопроцентная гарантия, что вирус пандемического гриппа появится в мире не в этом, так в следующем или в ближайшие годы", - сказал Львов. "Как это бывало и в прошлом, из уже существующих вирусов гриппа обязательно генерируется новый, который и вызовет пандемию. Осталось полшага до пандемической катастрофы в мире", - добавил ученый.

[Миру угрожает вирус панде-мического гриппа, может погибнуть миллиард человек. – Newsru, 28 октября 2004, 18:51; https://www.newsru.com/russia/28oct2004/pandemonia.html]

Мне нравится, как "предвидели" *гадальщики на бухарском базаре*:

"Один самаркандец предлагает мне восемнадцать кип шерсти. Будет ли выгодной для меня эта сделка? - спрашивал купец? Гадальщик по торговым делам начал считать крысиные кости, раскидывать бобы, затем с видом сурового глубокомыслия отвечал: "Покупай, но следи, чтобы во время уплаты около тебя на сто локтей вокруг не было ни одного плешивца".

[Л. Соловьев "Повесть о Ходже Насреддине", 1954]

Вот еще один "предвидец", это уже рекордсмен по предвидениям: "Ничего нового в этом нет, утверждает академик Киселев. Все пандемии гриппа были пандемиями птичьего гриппа".

И он же своих героических усилиях: "С 1997 года мы имеем постоянные вспышки, но пандемии взрывного характера у нас пока нет, поэтому у нас есть время к ней подготовиться. Но то, что пандемия будет - это точно", - подчеркнул директор института." [https://obzor.city/news/32401]

И пример цинизма:"Ситуация с H5N1 (вирус гриппа птиц) неактуальна сегодня. Он другой уже, он уже не способен убить человека, не способен ввергаться в организм человека", сказал Дроздов на пресс-конференции в Новосибирске во вторник. По его словам, вирус изменился и мутировал" [https://www.km.ru/news/ptichij_gripp_bolshe_ne_opasen_d]

С птичьим гриппом, все! Завязали по причине "мутирования" вируса. Взял и мутировал за пару дней! Кстати, мутировал он не один, а вместе с деньгами на вакцину.

Politics play big role in world health decisions
Travel bans, border closures, and raising alert levels all have implications

MS NBC, AP, 3 May 2009, 12:27 p.m. ET

https://web.archive.org/web/20090819041056/http://www.msnbc.msn.com/id/30547728/

Geneva – At the U.N. agency spearheading the fight against swine flu, key decisions are based on more than just health issues – politics plays a big role, too.

With global powers like the United States and China all lobbying for their own national interests behind the scenes, measures such as travel bans, border closures, and raising alert levels can meet stiff political opposition. Some have even wondered if granting the World Health Organization beefed up powers to independently tackle health crises might help, giving it authority to make key decisions or send doctors into a country to investigate the spread of a disease.

WHO's mandate is to direct and coordinate U.N. health policy: It makes recommendations and global assessments on issues including HIV/AIDS, malaria, and tuberculosis, and also coordinates responses to health crises like disease outbreaks and humanitarian disasters. But its recommendations are not binding – and countries are free to disregard WHO's advice.

"WHO is in an incredibly difficult position," said Richard Horton, editor of the Lancet medical journal. "On the one hand, its entire modus operandi is that it responds to government requests. But in this situation, what governments might want may not align with what WHO thinks is best."

Key to containing the illness

Horton cited the 2003 SARS outbreak as a prime example. When the illness began spreading in Toronto, WHO issued a recommendation advising against nonessential travel to Canada's largest city. Similar recommendations were made for cities including Hong Kong, Beijing and Taipei.

The recommendations sharply cut travel to affected economies, dealing them a big economic blow – but the aggressive WHO action was credited with being key to containing the illness.

The advisory incensed Canada, and Toronto's then-mayor publicly lambasted the agency, declaring it had no right to issue such guidelines. A delegation of Canadian diplomats and journalists flew to Geneva and camped out at WHO's Geneva headquarters, forcing the agency to reconsider – and eventually lift – the advisory.

"I suspect the reason WHO has been very reluctant to make any comments about travel (during the swine flu outbreak) is because of that experience with Canada during SARS," said Horton.

By issuing the controversial advisories, WHO's director-general at the time, Gro Harlem Brundtland, proved she was ready to confront countries.

Current chief both praised and criticized

WHO's current chief, Margaret Chan, has been both praised and criticized for her less confrontational leadership – which only recently helped to end a decades-long standoff between China and Taiwan to allow the island to participate in global health meetings. Critics contend that her unwillingness to publicly pressure member states can undermine efforts to protect global health.

Notably, Chan has come under scrutiny for being publicly neutral over Indonesia's refusal to share bird flu samples with the scientific community – which leaves a gaping hole in experts' ability to see how bird flu is evolving.

"Indonesia's behavior isn't helpful, but WHO did not confront them about it," said Adam Kamradt-Scott, a global health governance expert at London's School of Hygiene and Tropical Medicine. He said Chan, as the head of WHO, can only do what her member states allow her to do.

"Avoiding open fights is kind of the sine qua non of working for an international organization," Dr. Jeffrey Koplan, an ex-director of the U.S. Centers for Disease Control and Prevention. "But when it comes to protecting public health, I don't think she would hesitate for a second to do whatever is necessary, including being at odds with a WHO member state."

Koplan said chastising countries publicly can only lead to "short-term victories" and that it is essential for the WHO chief to keep open channels of communication with all countries.

WHO'S flu chief, Dr. Keiji Fukuda, insists the agency's discussions on how to react to outbreaks are "focused purely" on medical issues, such as how the disease is being transmitted.

Billionaire club in bid to curb overpopulation
America's richest people meet to discuss ways
of tackling a 'disastrous' environmental, social and industrial threat

The Sunday Times, 24 May 2009, 1.00am BST
https://www.thetimes.co.uk/article/billionaire-club-in-bid-to-curb-overpopulation-d2fl22qhl02
https://web.archive.org/web/20101118002933/http://www.timesonline.co.uk/tol/news/world/us_and_americas/article6350303.ece

Some of America's leading billionaires have met secretly to consider how their wealth could be used to slow the growth of the world's population and speed up improvements in health and education.

The philanthropists who attended a summit convened on the initiative of Bill Gates, the Microsoft cofounder, discussed joining forces to overcome political and religious obstacles to change.

Described as the Good Club by one insider it included David Rockefeller Jr, the patriarch of America's wealthiest dynasty, Warren Buffett and George Soros, the financiers, Michael Bloomberg, the mayor of New York, and the media moguls Ted Turner and Oprah Winfrey.

These members, along with Gates, have given away more than £45 billion since 1996 to causes ranging from health programmes in developing countries to ghetto schools nearer to home.

They gathered at the home of Sir Paul Nurse, a British Nobel prize biochemist and president of the private Rockefeller University, in Manhattan on May 5. The informal afternoon session was so discreet that some of the billionaires' aides were told they were at "security briefings".

Stacy Palmer, editor of the Chronicle of Philanthropy, said the summit was unprecedented. "We only learnt about it afterwards, by accident. Normally these people are happy to talk good causes, but this is different – maybe because they don't want to be seen as a global cabal," he said.

Some details were emerging this weekend, however. The billionaires were each given 15 minutes to present their favourite cause. Over dinner they discussed how they might settle on an "umbrella cause" that could harness their interests.

The issues debated included reforming the supervision of overseas aid spending to setting up rural schools and water systems in developing countries. *Taking their cue from Gates they agreed that overpopulation was a priority*.

This could result in a challenge to some Third World politicians who believe contraception and female education weaken traditional values.

Gates, 53, who is giving away most of his fortune, argued that *healthier families, freed from malaria and extreme poverty, would change their habits and have fewer children within half a generation*.

At a conference in Long Beach, California, last February, he had made similar points. “Official projections say the world’s population will peak at 9.3 billion [up from 6.6 billion today] but with charitable initiatives, such as better reproductive healthcare, we think we can cap that at 8.3 billion,” Gates said then.

Patricia Stonesifer, former chief executive of the Bill and Melinda Gates Foundation, which gives more than £2 billion a year to good causes, attended the Rockefeller summit. She said the billionaires met to “discuss how to increase giving” and they intended to “continue the dialogue” over the next few months.

Another guest said there was “nothing as crude as a vote” but a consensus emerged that they would back a strategy in which population growth would be tackled as a potentially disastrous environmental, social and industrial threat.

“This is something so nightmarish that everyone in this group agreed it needs big-brain answers,” said the guest. “They need to be independent of government agencies, which are unable to head off the disaster we all see looming.”

Why all the secrecy? “They wanted to speak rich to rich without worrying anything they said would end up in the newspapers, painting them as an alternative world government,” he said.

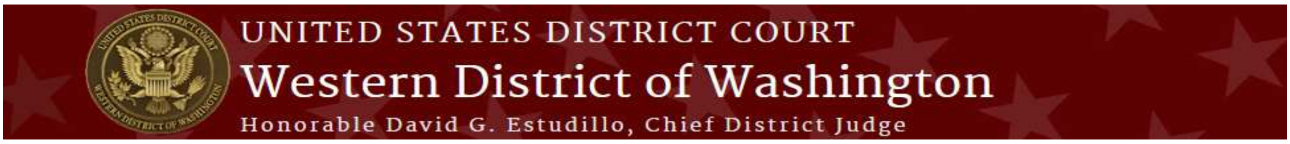
Billionaire club in bid to curb overpopulation

America's richest people meet to discuss ways of tackling a 'disastrous' environmental, social and industrial threat



Rebecca Campbell files federal lawsuit over WHO flu scam in Seattle

US District Court, Western District Of Washington, At Seattle, 24 October 2009

https://cupdf.com/document/rebecca-campbell-files-federal-lawsuit-over-who-flu-scam-in-seattle.html?page=1
https://web.archive.org/web/20091029221826/http://www.theflucase.com/index.php?option=com_content&view=article&id=1355:rebecca-campbell-files-federal-lawsuit-over-who-flu-scam-in-seattle&catid=1:latest-news&Itemid=64&lang=en

UNITED STATES DISTRICT COURT
WESTERN DISTRICT OF WASHINGTON
AT SEATTLE
REBECCA EM CAMPBELL ,
Plaintiff, Civil Action No.
vs. Jury Trial Demanded
KATHLEEN SEBELIUS, Secretary,
States Department of Health and Human
Services; THOMAS R. FRIEDEN, M.D., M.P.H.,
Director, United States Centers for Disease
Control and Prevention; FRANCIS S.
COLLINS, M.D., Ph.D., Director,
United States National Institutes of
Health; and MARGARET ANN HAMBURG , M.D.,
Commissioner, United States Food and
Drug Administration.
Defendants.

Complaint for Declaratory and Injunctive Relief

Plaintiff alleges the following in support of her claim for declaratory and injunctive relief and damages:

Jurisdiction and Venue

1. This is a claim for declaratory and injunctive relief and damages with jurisdiction in this court based upon 28 U.S.C. § 1331 with issues arising under the Constitution and laws of the United States.

2. Venue is proper in this district pursuant to 28 U.S.C. § 1391(e) because this is a civil action in which the defendants are officers or employees of the United States acting in their official capacity or under color of legal authority, plaintiff resides in this district and no real property is involved in the action.

Parties

3. Plaintiff Rebecca Em Campbell is a universal sovereign being, a citizen of the United States and a resident of Seattle, King County, Washington.

4. Defendant Kathleen Sebelius (hereafter "defendant Sebelius") is an adult resident of the state of Kansas with a professional address of 200 Independence Avenue, S.W. , Washington, D.C. 20201. Defendant Sebelius is the secretary of the United States Department of Health and Human Services.

5. Defendant Thomas R. Frieden, M.D., M.P.H. (hereafter "defendant Frieden") is an adult resident of the state of New York with a professional address of 1600 Clifton Road, Atlanta, GA 30333. Defendant Frieden is the director of the United States Centers for Disease Control and Prevention.

6. Defendant Francis S. Collins, M.D., Ph.D. (hereafter "defendant Collins") is an adult resident of the state of Virginia with a professional address of 9000 Rockville Pike, Bethesda, MD 20892. Defendant Collins is the director of the United States National Institutes of Health.

7. Defendant Margaret Ann Hamburg, M.D. (hereafter "defendant Hamburg") is an adult resident of the state of New York with a professional address of 10903 New Hampshire Avenue, Silver Spring, MD 20903. Defendant Hamburg is the commissioner of the United States Food and Drug Administration.

Factual Allegations

8. There presently exists a bank-based transnational corporate criminal conspiracy to violate the fundamental constitutional rights and wellbeing of the American people, including those of the plaintiff, through fraudulent political, legal and financial contracts in the form of surreptitiously signed/enacted international treaties and federal laws/executive orders enabling the mandated imposition of bioweaponized H1N1 influenza vaccinations and quarantines/detentions through martial law. The aforementioned measures, being fraudulent, are therefore null and void, with no legitimate power to be enforced by any government, national or international, upon the American people.

9. Controlled by the same bank-based transnational corporate crime syndicate that now controls the United States government and virtually all of the national governments of the world, the United Nations World Health Organization (UN/WHO) has fraudulently declared, without any scientific justification, the highest possible Level 6 Pandemic for an indefinite period of time, which is akin to a medical "war on terror".

10. Level 6 Pandemic status gives the UN/WHO, by various international agreements signed by the US government and by various federal executive orders, as well by various laws surreptitiously approved by the US Congress and supported by the US Supreme Court, indefinite control over this nation and its people that subsumes the US Constitution, the US Bill of Rights, the American Declaration of Independence and all federal, state and local laws.

11. Level 6 Pandemic status may generate, via the aforementioned planned mandated martial law, quarantines/ detentions and enforced bioweaponized H1N1 influenza vaccinations, massive profits for this bank-based transnational corporate crime syndicate through the hugely profitable sale of said vaccinations to the US and other national governments, as well as through massive confiscation of private property through coordinated medical genocide and disablement of the American people.

12. There is an urgent need to return to, reconsider and reapply those fundamental declarations of universal and national law that have so eloquently set forth the basis of our freedom and wellbeing, both as singular sovereign beings, and as a people, which this federal legal action seeks to remedy. ...

21. Public health agencies of the US government, including the Centers for Disease Control (CDC), the Food and Drug Administration (FDA), the National Institutes of Health (NIH), the National Institute of Allergic and Infectious Diseases (NIAID), and the Institute of Medicine (IOM), as well as the United Nations World Health Organization (UN-WHO) and major transnational pharmaceutical corporations met at the Simpsonwood Retreat Center in Norcross, Georgia in June 2000 to listen to the research findings of a CDC epidemiologist as to his findings, derived from the CDC's own comprehensive national database, that vaccines are not only ineffective in protecting the public against the diseases they are supposedly designed to curtail, but that they are actively harmful, causing other serious chronic disease conditions and death long-term, and sometimes soon after their administration.

22. The rest of that weekend was spent by officials of these government public health agencies conspiring with those representatives of transnational pharmaceutical corporations present to actively suppress in the future all scientific research disproving the safety and efficacy of vaccinations as a public health measure.

23. On June 11, 2009, the World Health Organization (WHO) of the United Nations (UN) declared – without any scientific justification whatsoever – attracting much criticism from medical experts – a worldwide highest possible "Level 6 Pandemic," thereby triggering deliberately unpublicized US presidential executive orders and UN treaties that place all US military, law enforcement and health services under the control of WHO and UN.

24. According to the International Health Regulations of 2005 (IHR 2005), which have been incorporated into legislation also in the International Partnership on Avian Influenza of 2005 (IPAI 2005), as well as numerous US presidential directives, the WHO and the UN become the controlling agencies of the US in the event of a declared Level 6 Pandemic, and are entitled to control of this country under martial law, with obvious implications for all of the above, under the pretext of dealing with a pandemic emergency.

25. Since refusing a WHO-mandated vaccination has been criminalized by these, and various other state laws derived from the Model State Emergency Health Powers Act, (MEHPA) members of law enforcement/ the military can use bodily/deadly force against "criminal suspects" refusing these mandated vaccinations or resulting order of quarantine.

26. Immediately following the abovementioned announcement by the WHO in June 2009, all signatory nations of the International Health Regulations of 2005, including the US, are obliged to give mass mandatory vaccinations and prepare for other measures such as quarantines, as/when mandated by the WHO.

27. The United States may then be controlled via various international agreements and executive orders by the United Nations (UN)/World Health Organization (WHO), now in turn controlled by the abovementioned bank-based transnational corporate crime syndicate through national governments and major nonprofit funding foundations that it presently controls.

28. There exists evidence from a WHO Memo dated from 1972, in which the WHO describes a method for using injections/vaccines to kill those injected in three steps: first, by weakening the immune system; second, by injecting a huge dose of virus into the body, which the weakened immune system cannot fight; and third, by injecting an adjuvant that triggers a massive an inflammatory reaction with an ensuing cytokine storm. There is evidence that the H1N1 influenza vaccinations recently mandated by the WHO follow that same three-step process outlined in the aforementioned WHO memos, and so intentionally cause damage and death.

29. There is evidence that the WHO is systematically concealing evidence of the lethality/morbidity of these vaccines, classified as bioweapons by US and EU regulators, in an act of fraudulent misrepresentation, to induce the populations of these countries to take said vaccines of their own free will, even while putting in place measures to make these vaccinations mandatory.

30. Now-FDA Director Margaret Hamburg publicly conferred with David Nabarro, key official with the UN/WHO and others as to how exactly such a pandemic would occur at a conference at Colorado's Aspen Institute on October 13, 2007, discussing with suspiciously precise prescience a future WHO-declared pandemic emergency eerily resembling the one it has declared at present.

31. The United States government has begun actively planning for mass forced vaccinations, detainment and quarantine of American citizens, including surreptitiously excavating mass gravesites in diverse locations.

32. There is evidence that in February 2009, the WHO was involved in nearly triggering a pandemic in Austria , by supplying Baxter's Austrian subsidiary with a H1N1 virus that Baxter then used to contaminate 72 kilos of vaccine material.

33. The Baxter laboratory in Orth von der Donau manufactured and distributed 72 kilos of vaccine material contaminated with a H1N1 virus, to sixteen laboratories in four countries, including Austria, thereby nearly triggering a pandemic.

34. The contaminated vaccine material consisted of a mixture of a seasonal H3N2 human influenza virus and the deadly H5N1 virus. By adding a virus of the type H5N1 to an ordinary flu virus of the type H3N2, Baxter produced a highly dangerous bioweapon.

35. A staff member of a subcontracted laboratory in the Czech Republic discovered this lethal contamination, when all animals they tested died from this vaccine, and the contamination was reported to health authorities.

36. In Poland during this same period, twenty-one out of thirty homeless research subjects – on whom these vaccines were tested without full disclosure of what was being administered to them – died, manifestly violating basic medical ethics and international law.

37. Since Baxter is obliged to use BSL 3 (Biosafety Level 3) precautions in its laboratories when handling the H1N1 virus (classified as a biological agent, BSL3 or 4 under EU regulations), such safeguards are in place as would make accidental contamination of ordinary influenza material with the dangerous H1N1 virus impossible. In other words, this deadly contamination and distribution was almost certainly due to criminal intent.

38. Thirty-six people had to be preventatively hospitalized in Austria and the Czech Republic because of their exposure to this vaccine-based contamination, underlining the danger of a pandemic.

39. This incident, that very nearly killed millions, was investigated by WHO, EU and Austrian health authorities only perfunctorily. This incident was neither investigated nor reported upon by any of the mainstream media corporations controlled by the transnational bank-based corporate crime syndicate, which, via institutional investment firms such as Goldman Sachs and State Street Global Advisors, also owns Baxter International.

40. It was later revealed in Austrian parliamentary questioning of Baxter executives that this incident had been handled, not as a serious violation of biosecurity regulations as mandated by law, but as a minor offense against the Austrian veterinary code: a veterinarian was sent to the Austrian Baxter laboratory for a brief inspection together, with a representative from the department for human medicine. No action appears to have been taken, other than recommendations to tighten Austrian veterinary laws.

41. On April 28, 2009, a shipment of said deadly virus from a WHO/Baxter-affiliated laboratory in Mexico was released from a suspiciously atypical hazardous biomaterials container, allegedly by accident, on an intercity train bound for Geneva, Switzerland , exposing sixty-one passengers to infection. To date, there has been no credible forensic investigation of this incident by the UN/WHO or Swiss/EU officials, and none of those exposed in this alleged bioaccident were ever properly treated for their exposure to this virus.

42. There is further indication of Baxter's criminal intent: in 2006, Baxter distributed hemophiliac blood components that were contaminated with HIV virus and administered to tens of thousands of people, including thousands of children in Europe . Baxter continued to release this HIV-contaminated vaccine, even after its contamination was known, yet Baxter International is still eligible to be one of the medical contractors being used by the United States government in their current purchase of vaccines that it by executive order could mandate for the American people.

43. Baxter International patented a vaccine for the allegedly new "H1N1" virus in 2008, indicating, with its aforementioned actions that it might potentially be involved in initiating such a pandemic.

44. It would therefore appear that officials of the Swiss health ministry and other officials of the UN, WHO, EU, US, Austria, Switzerland and/or Baxter International should also be interrogated concerning this matter by a grand jury; this has thus far not occurred.

45. In spite of the scientific evidence that mercury preservatives and assorted adjuvants are dangerous, the WHO is specifically recommending the production and use of vaccines containing highly toxic mercury preservative and oil-in-water adjuvants in its planned mass vaccination campaign starting in October 2009.

46. In a briefing note of July 13, 2009, the WHO stated: “In view of the anticipated limited vaccine availability at global level and the potential need to protect against "drifted" strains of virus, (it was) recommended that promoting production and use of vaccines such as those that are formulated with oil-in-water adjuvants and live attenuated influenza vaccines, was important.”

47. Adjuvants are added to vaccines supposedly to make them more “effective” and to reduce the amount of vaccine required per dose. This is induced by causing the immune system to react in a powerful, unnatural and potentially dangerous way to the presence of the virus being vaccinated against. As previously mentioned, an adjuvant added to a high dose of virus can cause a massive inflammatory reaction with a cytokine storm, followed by death.) ...

53. These H1N1 influenza vaccines will be developed, “tested,” and shipped for mass distribution in a matter of weeks without adequate trials for long-term safety.

54. Transnational vaccine manufacturers are present as observers on key WHO vaccine advisory boards of the WHO that can formally recommend vaccinations, indicating substantial conflict of interest.

55. The WHO refused to release minutes of a key meeting on July 7, 2009, when its "vaccine advisory board" -- packed with transnational pharmaceutical corporation executives as observers -- recommended to the WHO that it order enforced vaccinations around the world using their vaccines, ensuring them vast profits.

56. The institutional investors and banks behind the WHO and these vaccine manufacturers are set to reap huge profits from the mass murder of Americans in terms of property and financial assets acquired, as well as profits from massive US government vaccine purchases.

57. The WHO has made a unilateral declaration of highest Pandemic Level 6 on the basis of a relatively harmless H1N1 influenza, manipulating data, and so misusing a provision designed for a deadly plague unjustified by any scientific evidence, in order to declare an international public health emergency for an indefinite period of time to acquire new emergency powers throughout the globe.

58. Cases of H1N1 influenza have been relatively mild, requiring little or no medical intervention, and deaths from the H1N1 virus remain extremely low, at less than one half of one percent of reported cases as of July 6, 2009, with no sign of the virus mutating to become more deadly, according to leading medical experts in France and Switzerland, Sweden and other countries, as well as according to Dr. Margaret Chan, head of the WHO.

59. Rapid tests have been shown to diagnose the H1N1 virus has been inaccurate nine times out of ten, casting doubt on the purportedly swift spread of this disease, and H1N1 has symptoms virtually indistinguishable from normal flu, and has never so far been isolated in the laboratory, further casting doubt on the legitimacy of the WHO's declaration of highest level pandemic emergency.

60. The WHO altered its official definition of pandemic in 2003, being guilty thereby of manipulating data. According to WHO’s present definition, a declaration of pandemic can be constantly maintained. In fact, every year since 1918 would have been Pandemic Level 6 under the WHO's latest definition.

61. The WHO has also changed this definition again this past spring of 2009, so as to be able to declare a pandemic based on the alleged spread of a disease, rather than based on its lethality as had been the case before, while discontinuing the use of accurate reporting standards for its incidence.

62. There is scientific evidence the Spanish Flu Pandemic was started by mass vaccinations of soldiers in 1918-1919.

63. A 1976 mass “swine flu” vaccination campaign in the USA had to be abandoned because more people died from the vaccines than the “swine flu” itself.

64. A recent WHO polio vaccination campaign in Nigeria has resulted in infection and a mutated polio virus crippling hundreds of Nigerians.

65. Criminal charges have been filed against Baxter International over the 72 kilos of contaminated biomaterial with the city state prosecutor in Vienna, Austria, resulting in a police investigation, and criminal charges filed with the FBI in the US concerning the role of Baxter International, the WHO and others in these spuriously declared pandemics and measures toward mass vaccinations.

66. On July 17, 2009, US Department of Health and Human Services Secretary Kathleen Sebelius signed an emergency use order, giving to Baxter International and all other potential US government influenza vaccine contractors legal immunity from prosecution or lawsuit for any possible injury done by their vaccines to the American people during this spuriously declared public health emergency.

67. On September 15, 2009, the FDA approved H1N1 influenza vaccines, despite the massive evidence presented to it concerning their lack of safety/efficacy.

68. The American people, including the plaintiff as a class of one, will suffer substantial and irreparable harm and injury if they are forced to take this unproven vaccine without their consent, in accordance with the federal Model State Emergency Health Powers Act, National Emergency Act, National Security Presidential Directive/NSPD 51, Homeland Security Presidential Directive/HSPD-20, and the International Partnership on Avian and Pandemic Influenza.

Therefore, given that --

69. A bank-based transnational bank-based corporate crime syndicate controls the pharmaceutical cartel, the UN/WHO, as well as the US government;

70. Public health-related agencies of the US government, the UN/WHO and the pharmaceutical cartels have together conspired to promulgate injurious, ineffective vaccinations, despite massive evidence from their own databases that they also have together conspired to conceal from the general public;

71. There were two recent narrowly averted international medical catastrophes -- which facts and evidence point to being intentionally engineered by Baxter International and the WHO -- that almost triggered a pandemic, and these H1N1 vaccines – classified as bioweapons by regulators -- are being fraudulently misrepresented as prophylactic measures for a mild flu;

72. Baxter International and other potential/actual US government vaccine contractors have been given immunity from legal recourse by the American people for any substantial injury or death caused by federally mandated enforced vaccinations;

73. NIAID/CDC-sponsored trials of the H1N1 influenza vaccine scheduled to begin on pregnant women and small children in August/September 2009 do not include toxic adjuvants, and will give a misleading impression of the impact of the planned, possibly imminent federally mandated enforced vaccination on the health of those receiving them. They therefore do not fulfill the criteria laid down for adequate clinical trials, any more than levels of toxic mercury preservative in vaccines being increased in those given to pregnant women and young children and the addition of dangerous adjuvants such as squalene represent ethical or effective public healthcare procedures;

74. The UN/WHO has declared, without adequate scientific evidence, a highest possible Level 6 Pandemic giving them, by various fraudulent international agreements surreptitiously signed by the US government and various federal executive orders, indefinite control over the US and its populace that subsumes the US Constitution, the Bill of Rights, the Declaration of Independence and all federal, state and local laws – it is therefore these very oracles of human freedom that must now be invoked to protect the American people.

Constitutional Basis of This Case

75. Amendment 1 to the United States Constitution declares:

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the government for a redress of grievances.

76. The First Amendment forbids Congress to enact any laws abridging freedom of speech or of the press; of the right of the people peaceably to assemble or to petition the government for a redress of grievances. Yet the corrupt US Congress has for the past hundred years enabled and/or engaged in all of the aforementioned violations of our constitutional rights by passing laws and allowing to stand without investigation or legislative action executive orders and judicial decisions depriving the American people of these constitutional rights through corporate consolidation of the communications media denying Americans free expression and timely, accurate information essential for authentic democracy to exist; corporate control of our federal government through money-based elections, lobbying, extortion and bribery; its letting stand executive orders allowing detentions and quarantines during martial law, denying the people their right peaceably to assemble; and, most recently, emergency use orders issued by the federal executive branch on behalf of pharmaceutical corporations giving them immunity from administrative redress through federal disciplinary action on behalf of the American people who may have injured or killed by their untested vaccines.

77. Amendment 4 to the United States Constitution provides:

The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated; and no warrants shall issued but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

78. The Fourth Amendment forbids home invasions by public health officials for citizens refusing enforced vaccinations, and the right of the people to be secure in their persons expressly forbids enforced vaccinations without due process as well.

79. Amendment 5 to the United States Constitution provides:

Trial and Punishment, Compensation for Takings. No person shall be...deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation.

80. The Fifth Amendment forbids public health quarantines or detentions with confiscation of property without due process of law, which measures mandating martial law, enforced vaccinations and quarantines/ detentions without due process of law manifestly violate.

81. Amendment 7 to the United States Constitution provides: Right to Trial by Jury. In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury, shall be otherwise reexamined in any court of the United States, than according to the rules of the common law.

82. The Seventh Amendment forbids the federal government granting legal immunity to corporations for any death or injury caused by their products, such as has just been granted to pharmaceutical corporations for their vaccines, precluding any lawsuits or prosecution by the American people.

83. Amendment 8 to the United States Constitution provides: Cruel and Unusual Punishment. Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

84. The Eighth Amendment forbids cruel and unusual punishments, such as would be inflicted by spuriously mandated, inadequately tested, toxically composed H1N1 influenza vaccinations, and mandated quarantine/ detention and/or deprivation of property for those who refuse them.

85. Amendment 9 to the United States Constitution provides: Construction of Constitution. The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people.

86. Amendment 10 to the United States Constitution provides: Powers of the States and People. The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

87. The Ninth and Tenth Amendments, respectively, forbid the use of federal power to deny the sovereign rights of the people, and affirm that ultimate power resides with state governments and with the American people.

88. Amendment 14, Section 1 to the United States Constitution provides: All persons born or naturalized in the United States and subject to the jurisdiction thereof are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

89. Amendment 14, Section 3 to the United States Constitution provides: No person shall be a Senator or Representative in Congress, or elector of President and Vice President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof...

90. Article 14, Section 1 of the United States Constitution generally reinforces and affirms all of the rights of US citizens enumerated in the previously cited constitutional amendments, including the right to privacy, being violated by all of the aforementioned WHO/US healthcare mandates. Section 3 forbids anyone who commits treason against the United States

-- as many present federal officials of the executive, legislative and judicial branches are manifestly doing -- from holding any further public office, much less continuing to act with apparent immunity from any investigation and prosecution.

91. The American Declaration of Independence states:

We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable right; that among these are life, liberty and the pursuit of happiness.

That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute new government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness.

Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security.

92. The last paragraph of the American Declaration of Independence very precisely describes the continuous tyranny that we as a people have long been experiencing from our corrupt, corporate-controlled federal government, along with its precisely prescribing its just and effectual remedy. It also declares the right of the people to abolish any existing political contract with their government when the basis of that political contract has become fraudulent in nature, and therefore null and void

Causes of Action

COUNT NO. 1: Violation of the First Amendment: abridgement by the federal government of freedom of speech and of the press, of the right of the people peaceably to assemble, and to petition the government for a redress of grievances.

COUNT NO. 2: Violation of the Fourth Amendment: abridgement by the federal government of the right of the people to be secure in their homes and in their persons.

COUNT NO. 3: Violation of the Fifth Amendment: abridgement by the federal government of the right of the people to enjoy their life, liberty and property without interference, unless otherwise abridged by due process of law.

COUNT NO. 4: Violation of the Seventh Amendment: abridgement by the federal government of the right of the people to trial by jury and legal redress of grievances.

COUNT NO. 5: Violation of the Eighth Amendment: abridgement by the federal government of protection of the people from cruel and unusual punishment.

COUNT NO. 6: Violation of the Ninth and Tenth Amendments: abandonment by the federal government of the fundamental constitutional principle that all unspecified sovereign power resides with the people and with the various states.

COUNT NO. 7: Violation of the Fourteenth Amendment: abridgement by the federal government of untrammeled access by the American people to all aforementioned constitutional rights of citizenship, including that of privacy, and the right of the people to remove from office all public officials who have committed treason against the United States .

COUNT NO. 8: Violation of the American Declaration of Independence: abridgement by the federal government of the right of the people to maintain their sovereignty and freedom from any foreign power; their right to expect good faith on the part of their government in the political contract that it has with the people, and their right to remove from power any government that violates their sovereign human rights through fraudulent political contract.

Demand for Relief

WHEREFORE, plaintiff prays for relief as follows:

1. That the Court immediately grant an Injunction for relief in these matters, thereby revoking, by authority of the 1st, 4th, 5th, 7th, 8th, 9th, 10th, and 14th Amendments of the US Constitution, as well as by the authority of the American Declaration of Independence from the royally chartered corporations of the British Empire any powers spuriously presumed by the federal government, now or in the future, through executive orders or international agreements issued/signed by any officials, past or present, of the federal government; that any officials of the federal government be thereby forbidden, now or in the future, to commit perjury concerning the alleged benefits or efficacy of any suspiciously derived/designed mandatory or voluntary vaccination, thus engaging in fraudulent financial contracts with their makers, to declare unilaterally any corporate legal immunity to the purveyors of vaccines for said vaccinations, or to unilaterally impose any federally mandated vaccinations/quarantines/detentions/international governments upon the American people, thus making their political contract with the people fraudulent, and therefore null and void.

2. That the Court order the United States Attorney to convene a grand jury investigation based upon the abovementioned allegations by the authority vested in this Court and the US Attorney to prevent any possible injury to the American people by means of any aforementioned possible federally mandated martial law, with enforced vaccinations/quarantines/ detentions.

3. That the Court order an investigation of this matter by the US Attorney under the Racketeering Influenced Corrupt Organizations Section (RICO-USC 18) of the Organized Crime Control Act (OCCA) of 1970, particularly its Sections 175-Prohibition with Respect to Biological Weapons; 241-Conspiracy Against Rights; 1031-Fraud Against the United States; 1091-Genocide; 2384-Seditious Conspiracy; 2382-Misprision of Treason and 2384-Seditious Conspiracy, as well as the Sherman Antitrust Act of 1890, whose farsighted provisions have been largely ignored by the US government since the latter half of the twentieth century.

4. That the Court order an investigation by the US Attorney of persons who may be responsible in an effort to prevent any planned enforced bioweaponized vaccinations, which persons to be investigated should include:

Baxter USA Executives:

- Joseph Martin 221 N Walnut St , Bensenville , IL 60106 .
- Bruce McGillivray 151 Ridge Lane , Lake Forest , IL 60045 .
- Norbert Riedel 1520 N Sheridan Rd , Lake Forest , IL 60045 .

Other Government/Corporate Officials:

● Jeffery K. Taubenberger, M.D., Ph.D., presently employed as a vaccine development expert at the NIH, who exhumed frozen bodies with the admitted purpose of reconstructing the deadly 1918 flu, caused by tainted vaccines injected into US military servicemen that killed 50-100 million people.

● US Health and Human Services Secretary Katherine Sebelius, who in July 2009, signed an order indemnifying Baxter International and other purveyors of the H1N1 vaccines from compensatory lawsuits or prosecution by US citizens, and who is implementing a mass vaccination campaign in spite of the evidence other measures such as surgical masks and natural preventive remedies would be more effective and less expensive if a pandemic actually did break out.

● Drs. Margaret Hamburg, Margaret Chan and David Nabarro, presiding officers of, respectively, the US Food and Drug Administration (FDA) and the UN World Health Organization (UN-WHO) who, immediately following Dr. Jeffery K. Taubenberger's six-year program of reconstructing the deadly 1918 virus, announced to the world via the UN that a new pandemic is about to occur that would kill "...5 to 150 million". Hamburg and Nabarro, as previously mentioned, also discussed exactly how such a deadly pandemic would occur at a videotaped conference at the Aspen Institute-US on October 13, 2007.

● Goldman Sachs, State Street Global Advisors, the Bank of Austria, the Rothschild family-owned, Bernard Madoff-tainted Banco de Medici, the Rockefeller family interests, and all other financial or funding institutions which have institutional ownership or regular financial dealings with Baxter International and other transnational vaccine manufacturers, as well as all major private foundations funding the WHO and vaccine research, including the Rockefeller and Bill & Melinda Gates Foundations.

● Past and present officials of the US Department of Health and Human Services, the US Food and Drug Administration and the National Institutes of Health/US Centers for Disease Control and US Departments of Defense enabling the above-cited possible criminal/treasonous activities violating the US Bill of Rights, US Constitution, Declaration of Independence from the British Empire and its royally chartered corporations and other aforementioned US laws.

● Those presidents of the United States past and present signing executive orders giving over control of the United States to the United Nations and its associated agencies in the case of a WHO-declared Level 6 pandemic;

● As well as those members of Congress past and present who failed to investigate and halt these probable criminal and treasonous activities.

5. I do also hereby affirm the right of the American people inhabiting each and every state of the present federal union to engage in legal nonviolent official and unofficial secession from any government that has denied them their sovereign human rights, based on the 9th and 10th Amendments of the US Bill of Rights, as well as on the American Declaration of Independence from the royally chartered corporations of the British Empire and other aforementioned US laws; that they have the right to secede from a federal government, which, presently controlled by a bank-based transnational corporate crime syndicate, has in fact seceded from the American people, and has conspired to commit acts of treason and crimes against humanity, not only against the people of the United States but against all of the peoples of the world.

I do hereby affix my signature and the date to the above pleading to this

honorable court.

DATED this 23rd day of October, 2009.

Dramatic moment man who 'threatened to blow up the White House' is tasered by police after eight-hour stand-off

Daily Mail, 14 August 2009, 17:42 BST,
https://www.dailymail.co.uk/news/article-1206515/Dramatic-moment-man-threatened-blow-White-House-Tasered-police-hour-stand-off.html

This is the moment a man making threats against the White House was finally seized from his car after an eight-hour stand-off.

The drama unfolded on Wednesday when the man, identified as Joseph Moshe, called a police dispatch number and threatened to blow up the White House, according to reports.

Officers then spotted his red Volkswagen Beetle at about 10am and pursued him through the west side of Los Angeles.

Moshe headed to the federal building parking area and drove around it once before a police SUV blocked him as he tried to return to the street. Authorities then surrounded his car with police cruisers and a large armored vehicle.

The federal building was locked down at noon and employees were told to stay inside.

The man then sat in the car smoking for hours before a robot broke a rear window of the car so officers could see inside and try to communicate. However Moshe did not respond, said a police spokesman.

A police robot manoeuvred next to the driver's door, and an armored vehicle parked in front of the vehicle so the man could not escape.

Police then fired tear gas into the suspect's vehicle in an attempt to force him to surrender.

But Moshe remained inside the car and briefly wound down the passenger window to let out the fumes.

He withstood four rounds of chemical agents before officers shot out the drivers' window with a bean bag gun.

Officers then used a Taser to restrain him before finally pulling him out of the car.

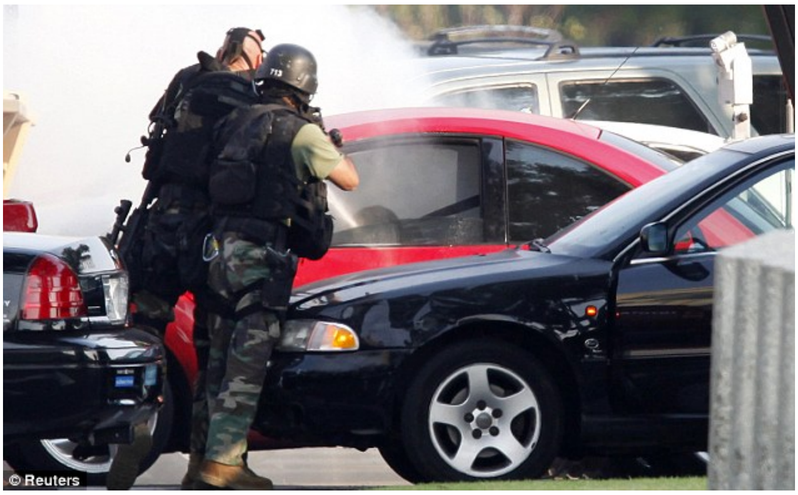
Detective Gus Villanueva said Moshe was booked on two previous unrelated misdemeanor warrants but did not provide details. Officials later said he was taken to a hospital for observation.

Asked how the man was able to withstand multiple rounds of tear gas, Villanueva said some people are able to resist the chemicals.

'I can't explain that, there's no way to explain that,' he said.

Stand-off: Police try to force Joseph Moshe out of his car in the Federal Building parking lot in Los Angeles, California during a pursuit which began when he allegedly made threats against the White House

No surrender: Moshe withstands several rounds of chemical agents aimed at the car and remains inside



Besieged: He is sprayed in the face by police after opening the window to let out the fumes

Surrounded: A robot is stationed next to the suspect's vehicle in order to break a rear window so officers can see inside and try to communicate

"Joseph Moshe (Moshe is the man's middle name) is a bio-scientist. He works (worked?) for a unit within Mossad. He is an Israeli citizen.

The Secret Service was not the agency involved in the surveillance of Moshe at his home in California. This was done by the FBI, who had orders to detain him, or "bring him in."

Moshe did not send a threat to the White House. Rather, he communicated that he intended to go public with information he had regarding the flu vaccine that is being prepared by Baxter Labs, an Austrian company.

The information is this: The vaccine is being manufactured in Ukraine. It is not a vaccine at all, but rather an engineered genetically mutated bio-weapon meant to cause sickness and death. Moshe informed the White House he intended to go public with this information. When he became aware that the FBI was about to detain him, he packed some belongings in his car and set out for the Israeli consulate, located in close proximity to the federal building where the standoff took place. FBI pursuit kept him from reaching his destination.

Mounted on top of the large black vehicle was a microwave weapon which fried the electronics in Moshe's car as well as any communication devices he had which might have been used to contact the media or others who could help him.

Moshe did not suffer the same effects of the gas and pepper spray that others would have because he had built up an immunity to such weapons as a by-product of his Mossad training.

Moshe was not handcuffed because he was not placed under arrest. After leaving police or FBI custody, he returned to Israel, where he is at this time.

The information comes from one of my confidential sources. I have reason to believe it is accurate. If I receive more information, I will post it."

THE FLU CASE

Joseph Moshe: "Swine flu vaccine is bioweapon"

The Flu Case, 21 August 2009

https://web.archive.org/web/20091102052516/http://www.theflucase.com/index.php?option=com_content&view=article&id=700%3Amicrobiologist-alleges-baxter-qswine-fluq-vaccine-is-a-bioweapon&Itemid=64

Joseph Moshe (MOSSAD Microbiologist)

Today, the MSM are not talking about this case any more. <...>

Professor Moshe had called into a live radio show by Dr. A. True Ott, (explanation of Joseph Moshe's call at 06:00) broadcast on Republic Broadcasting claiming to be a microbiologist who wanted to supply evidence to a States Attorney regarding tainted H1N1 Swine flu vaccines being produced by Baxter BioPharma Solutions. He said that Baxter's Ukrainian lab was in fact producing a bioweapon disguised as a vaccine.

He claimed that the vaccine contained an adjuvant (additive) designed to weaken the immune system, and replicated RNA from the virus responsible for the 1918 pandemic Spanish flu, causing global sickness and mass death. <...>

Does this sound like an insane conspiracy theory? Sure it does. Due to the scarcity and anonimity of the sources we would dismiss it as exactly that, if it weren't for some uncomfortable facts: Baxter Pharmaceutical has been caught, red-handed, in spreading a live, genetically engineered H5N1 Bird flu vaccine as a lethal biological weapon all over the world, destined to be used for human vaccinations. This happened just a few months ago. And only luck prevented a global catastrophe of epic proportions.

Baxter International Inc. had mixed live, genetically engineered avian flue viruses in vaccine material shipped to 18 countries. Only by sheer luck, a Czech laboratory decided to test the vaccine on a dozen ferrets, which all died in days. The World Health Organization was notified and catastrophe was averted. This was clearly a deliberate act on Baxter's part, because they adhere to BS3, bio-safety level three. Baxter admitted a "mistake". Such monumental screwups are totally impossible at that level. Many safety systems would have needed to be sabotaged, many key personell would have needed to be bribed. It simply can't be done without direction from the inside. They did not send out the wrong vial – they produced dozens of gallons of biological-weapon agent (genetically engineered live H5N1 / Bird flu virus), then sent it out as a "vaccine".

Baxter knew full well that their vaccine was lethal, because the year before they had tested it on a few hundred homeless Polish people – dozens died as a result. [See: Next page]

Zeiten Schrift

Bevölkerungsreduktion: Lauert in der Spritze der Tod?

Zeiten Schrift, 2010, Quartal 1, N 65
https://www.zeitenschrift.com/heft/zeitenschrift-65

Seuchen können in kurzer Zeit mehr Menschen dahinraffen als Krieg und Hunger. Was, wenn man sich dies zunutze machen würde? Werden Impfungen benutzt, um die Menschheit zu dezimieren?

...

Vorahnungen oder Insiderwissen?

Blenden wir einige Wochen weiter zurück in ein mehrere tausend Kilometer entferntes Aufnahmestudio des amerikanischen Radiosenders Republic Broadcasting. Am 11. August 2009 hatte Radiomoderator Dr. True Ott einen höchst merkwürdigen Telefonanruf mitten in seine Live-Sendung erhalten. Darin klärte ein gewisser Joseph Moshe die erstaunten Radiohörer darüber auf, daß er ein Mikrobiologe sei und hochbrisante Beweise besitze, die er einem Staatsanwalt übergeben wolle. Es gehe um einen verunreinigten H1N1-Schweinegrippeimpfstoff, den das amerikanische Pharmaunternehmen Baxter in der Ukraine herstelle. Dabei handle es sich in Tat und Wahrheit um eine als Impfung getarnte biologische Waffe. Zu diesem Zweck, so Moshe weiter, habe man der Impfung ein Adjuvans (Zusatzstoff) beigemischt, der das Immunsystem schwächen solle und RNA-Bestandteile jenes Virus enthalte, das 1918 die Spanische Grippe mit Millionen von Toten verursachte. Der Anrufer kündigte an, daß es in der Ukraine in naher Zukunft zum Ausbruch einer Seuche kommen werde.

Die tatsächliche Identität dieses in Kalifornien lebenden Joseph Moshe ist bis heute nicht zweifelsfrei geklärt. Manche behaupten, es handle sich dabei um den israelischen Professor Moshe bar-Joseph, was jedoch mehr als fragwürdig ist. Ganz sicher wurde der ominöse Mann jedoch am Abend des 13. August 2009 vom FBI vor laufenden Fernsehkameras verhaftet.

Nach seiner Ankündigung, das Weiße Haus informieren und sämtliche Fakten der Öffentlichkeit zugänglich machen zu wollen, flüchtete Moshe nämlich mit einem roten VW Beetle quer durch Los Angeles in Richtung des israelischen Konsulats. Dieses erreichte er aber nicht, weil die Bundespolizei und ein Bombenräumungskommando mit gepanzerten Wagen sein Auto einkeilten. Mikrowellenwaffen setzten die Elektronik des VWs und Moshes Handy lahm, anschließend nebelten die Polizisten ihn mit Tränengas ein, ein ferngesteuerter Roboter zerschlug das Autofenster, man versprühte mehrere Dosen Pfefferspray, versetzte Moshe mit einem Taser Elektroschocks und zerrte den Mann schließlich unsanft ins Freie – alles zu sehen auf dem Internetportal Youtube (Stichwort „Westwood Standoff“).

Was anschließend mit Joseph Moshe geschah, ist nicht bekannt. Manche spekulieren, er sei in ein Flugzeug gesetzt und nach Israel ausgeflogen worden. Als offizielle Begründung für die Verhaftung bemühten die Behörden einmal mehr die Angst vor dem Terrorismus: Joseph Moshe sei ein Verrückter, der gedroht habe, ein Bombenattentat auf das Weiße Haus zu verüben.

Baxters Beinahe-Katastrophe

Für die von Moshe vorgebrachten Anschuldigungen gegen Baxter gibt es keine offiziellen Beweise. Doch es ist nicht das erste Mal, daß der US-Pharmariese in das Kreuzfeuer der Kritik gerät. So sollen seinen Blutkonserven in der Vergangenheit Aidsviren beigemischt worden sein. Auch das läßt sich nicht beweisen ... [=> See: the main part – *Zeiten Schrift,* 2010, Quartal 1, N 65].

Harvard: Lab Workers Were Poisoned

Hartford Courant // The Associated Press, 25 October 2009, 12:51 p.m. EDT
https://web.archive.org/web/20091029140541/http://www.courant.com/news/nation-world/hc-harvard-lab-workers-poisoned-1025,0,3561022.story

Cambridge, Mass. - Harvard University says six researchers who became sick in August apparently were poisoned.

The Boston Herald says a memo released Friday says the group drank from a coffee machine on Aug. 26 that later tested positive for sodium azide, a common preservative used in labs.

The six reported symptoms ranging from dizziness to gar ringing, and one passed out. They were treated at Beth Israel Deaconess Medical Center and later released.

The researchers all work in the Harvard Medical School's pathology department using mice to investigate how diseases interact with the immune system.

Harvard says authorities are investigating the incident, and the school is tightening security in the building, in part by adding surveillance cameras.

NBC NEWS

Harvard lab workers poisoned by tainted coffee

NBC News, 26 October 2009, 2:29 AM + 0.8
https://www.nbcnews.com/id/wbna33470976

Six Harvard University medical researchers were poisoned in August after drinking coffee that was laced with a chemical preservative, according to university officials.

In an internal memo first reported in the Boston Herald's Sunday editions, the school said the coffee came from a machine near their lab that later tested positive for sodium azide, a common preservative used in labs.

The six reported symptoms after drinking the coffee Aug. 26, ranging from dizziness to ringing in the ears, and one passed out. They were treated at Beth Israel Deaconess Medical Center and later released.

The memo, written by Daniel G. Ennis, executive dean for administration, and Richard M. Shea, associate dean for physical planning and facilities, does not say whether officials believe the poisoning was intentional.

"As always, we are mindful of the need to be diligent about laboratory safety and security and the importance of proper management of laboratory chemicals," the memo states.

"We are in the process of installing additional security cameras throughout our buildings, and we are strengthening the security systems that manage access to the laboratories during both normal business hours and off hours," it goes on to say.

The researchers, which include staff and students, all work in the Harvard Medical School's pathology department in its new Boston research building. They were using mice to investigate how diseases interact with the immune system.

Harvard spokesman David Cameron on Sunday said university police are investigating along with the Occupational Safety and Health Administration and the Boston Public Health Commission.

"Essentially, there is an ongoing investigation of what appears to be a single isolated event," he said. "Because many details are unknown, (the medical school's) leadership is taking additional precautionary measures to help ensure the well-being of the community."

abc NEWS

Harvard University Researcher Says Coffee was Poisoned on Purpose

ABC News, 27 October 2009, 1:19 AM
https://abcnews.go.com/US/poisoned-harvard-researcher-spiked-coffee-fatal/story?id=8918291

A researcher who fell ill after just one sip says, this was no accident.

A Harvard University researcher whose coffee was spiked with a dangerous chemical said he believes the staff was intentionally poisoned with a toxic preservative used widely in the medical school's laboratory. "I can not think it would be an accident," Matteo Iannacone told ABCNews.com today. "Fortunately, I drank just a sip."

Despite drinking just a sip Iannacone, 33, was one of six people who became ill on Aug. 26 after drinking coffee from a communal espresso machine on the eighth floor of Harvard Medical School's New Research building.

Toxicology results, he said, showed the coffee contained a "very high concentration" of sodium azide, a powerful chemical preservative that can be fatal in high doses, causing respiratory failure. "All the research labs have it," Iannacone said. "It's very common."

Iannacone said he and two students from the pathology department had gone over to the single-serve coffee machine, a daily ritual, around and he noticed right away that there was something off. "As soon as we tasted a sip of the coffee, we noticed the taste was strange," he said. Within seconds, they experienced tachycardia, or a rapid heartbeat, and an increase in blood pressure. "We were sweating and we had to sit down, almost like we were fainting," he said.

Iannacone said that because he takes his coffee black - "I'm Italian," he explained -- he was able to notice the chemical right away. But they later learned that some of the other coffee drinkers had put sugar and milk in their cups, masking the altered taste, and drank the entire thing. Two people fainted, he said, and one of those people was hospitalized overnight. For Iannacone and the two students he was with, the symptoms began to disappear after about 10 minutes.

Cameron said all six involved with the poisoning were back at work within a day or two.

Iannacone said he wasn't particularly nervous about someone within the school trying to harm the students and employees, but that he found it "disturbing." Others, he said, are worried something might happen again.

David Cameron, spokesman for Harvard Medical School, said the coffee machine is not connected to the water supply. The water reserve tank is filled periodically by anyone who notices the water level getting low. Each re-fill can make several cups of coffee, he said, though it is unclear whether all six people got coffee from the same water supply.

The eighth floor coffee machine also served researchers and students on the 9th floor, he said, about 200 people total. The machine has since been removed. "We are now going to the Starbucks downstairs," *Iannacone* said, adding that the medical school is also installing new security cameras.

The university and it's police department have remained tight-lipped about the poisonings.

Cameron told ABCNews.com today that the university has contracted with an independent toxicologist as part of the Harvard University Police Department's investigation.

No students or employees have been disciplined, he said, and no arrests have been made. "The bottom line is they are looking very carefully and exhaustively at every single cause," *Cameron* said.

Salicylates and Pandemic Influenza Mortality, 1918–1919 Pharmacology, Pathology, and Historic Evidence

Clinical Infectious Diseases, 15 November 2009, 49 (9): 1405–1410
https://doi.org/10.1086/606060
https://academic.oup.com/cid/article/49/9/1405/301441

Abstract

The high case-fatality rate – especially among young adults – during the 1918–1919 influenza pandemic is incompletely understood. Although late deaths showed bacterial pneumonia, early deaths exhibited extremely "wet," sometimes hemorrhagic lungs. The hypothesis presented herein is that aspirin contributed to the incidence and severity of viral pathology, bacterial infection, and death, because physicians of the day were unaware that the regimens (8.0–31.2 g per day) produce levels associated with hyperventilation and pulmonary edema in 33% and 3% of recipients, respectively. Recently, pulmonary edema was found at autopsy in 46% of 26 salicylate-intoxicated adults. Experimentally, salicylates increase lung fluid and protein levels and impair mucociliary clearance. In 1918, the US Surgeon General, the US Navy, and the *Journal of the American Medical Association* recommended use of aspirin just *before* the October death spike. If these recommendations were followed, and if pulmonary edema occurred in 3% of persons, a significant proportion of the deaths may be attributable to aspirin.

...

In summary, just before the 1918 death spike, aspirin was recommended in regimens now known to be potentially toxic and to cause pulmonary edema and may therefore have contributed to overall pandemic mortality and several of its mysteries. Young adult mortality may be explained by willingness to use the new, recommended therapy and the presence of youth in regimented treatment settings (military). The lower mortality of children may be a result of less aspirin use. The major pediatric text [69] of 1918 recommended hydrotherapy for fever, not salicylate; its 1920 edition [70] condemned the practice of giving "coal tar products" in full doses for reduction of fever. The occurrence of Reye syndrome-like illness before the 1950s is debated and consistent with the fact that children's aspirin was not marketed until the late 1940s. Varying aspirin use may also contribute to the differences in mortality between cities and between military camps.

To determine the proportion of virus-induced pathology, subsequent bacterial infection, and overall 1918 pandemic mortality attributable to salicylate, experimental models and analysis of primary consecutive individual treatment and pathology records are needed. Prospectively, aspirin should be investigated in countries where aspirin is used for influenza.

Death of the Internet:
Censorship Bills in UK, Australia, U.S. Aim to Block "Undesirable" Websites

Infowars, 17 December 2009
https://web.archive.org/web/20091221001722/http://www.infowars.net/articles/december2009/171209Internet.htm

Cutting off access altogether, massive fines and even jail time proposed for those who flout new laws.

Internet censorship bills currently working their way into law in the UK, Australia and the U.S. legislate for government powers to restrict and filter any website that it deems to be undesirable for public consumption.

In the UK, legislation slated as the "Digital Economy Bill", currently being debated in the House of Lords, would allow the Home Secretary to place “a technical obligation on internet service providers” to block whichever sites it wishes.

Under clause 11 of the proposed legislation “technical obligation” is defined as follows:

A “technical obligation”, in relation to an internet service provider, is an obligation for the provider to take a technical measure against particular subscribers to its service.

A “technical measure” is a measure that:

(a) limits the speed or other capacity of the service provided to a subscriber;

(b) prevents a subscriber from using the service to gain access to particular material, or limits such use;

(c) suspends the service provided to a subscriber; or

(d) limits the service provided to a subscriber in another way.

In other words, the government will have the power to force ISPs to downgrade and even block your internet access to certain websites or altogether if it wishes.

The legislation comes in the wake of amplified UK government efforts to seize more power over the internet and those who use it.

For months now unelected "Secretary of State" Lord Mandelson has overseen government efforts to challenge the independence of the of UK’s internet infrastructure.

Mandelson also wants to impose harsh policies, via the Digital Economy Bill, that would see users' broadband access cut off indefinitely, in addition to a fine of up to £50,000 without evidence or trial, if they download copyrighted music and films. The plan has been identified as "potentially illegal" by experts.

The legislation would impose a duty on ISPs to effectively spy on all their customers by keeping records of the websites they have visited and the material they have downloaded. ISPs who refuse to cooperate could be fined £250,000.

As Journalist and copyright law expert Cory Doctrow has noted, the bill also gives the Secretary of State the power to make up as many new penalties and enforcement systems as he likes, without Parliamentary oversight or debate.

This could include the authority to appoint private militias, who will have the power to kick you off the internet, spy on your use of the network, demand the removal of files in addition to the blocking of websites.

Mandelson and his successors will have the power to invent any penalty, including jail time, for any digital transgression he deems Britons to be guilty of.

Despite being named the Digital Economy Bill, the legislation contains nothing that will actually stimulate the economy and is largely based on shifting control over the internet into government hands, allowing unaccountable bureaucrats to arbitrarily hide information from the public should they wish to do so.

Mandelson began the onslaught on the free internet in the UK after spending a luxury two week holiday at Nat Rothschild's Corfu mansion with multi-millionaire record company executive David Geffen.

The Digital Economy Bill is intrinsically linked to long term plans by the UK government to carry out an unprecedented extension of state powers by claiming the authority to monitor all emails, phone calls and internet activity nationwide.

Last year the government announced its intention to create a massive central database, gathering details on every text sent, e-mail sent, phone call made and website visited by everyone in the UK.

The programme, known as the "Interception Modernisation Programme", would allow spy chiefs at GCHQ, the government's secret eavesdropping agency, the centre for Signal Intelligence (SIGINT) activities (pictured above), to effectively place a "live tap" on every electronic communication in Britain in the name of preventing terrorism.

Following outcry over the announcement, the government suggested last April that it was scaling down the plans, with then Home Secretary Jacqui Smith stating that there were "absolutely no plans for a single central store" of communications data.

However, as the "climbdown" was celebrated by civil liberties advocates and the plan was "replaced" by new laws requiring ISPs to store details of emails and internet telephony for just 12 months, fresh details emerged indicating the government was implementing a big brother spy system that far outstrips the original public announcement.

The London Times published leaked details of a secret mass internet surveillance project known as "Mastering the Internet" (MTI).

Costing hundreds of millions in public funds, the system is already being implemented by GCHQ with the aid of American defence giant Lockheed Martin and British IT firm Detica, which has close ties to the intelligence agencies.

A group of over 300 internet service providers and telecommunications firms has attempted to fight back over the radical plans, describing the proposals as an unwarranted invasion of people's privacy.

Currently, any interception of a communication in Britain must be authorised by a warrant signed by the home secretary or a minister of equivalent rank. Only individuals who are the subject of police or security service investigations may be subject to surveillance.

If the GCHQ's MTI project is completed, black-box probes would be placed at critical traffic junctions with internet service providers and telephone companies, allowing eavesdroppers to instantly monitor the communications of every person in the country without the need for a warrant.

Even if you believe GCHQ's denial that it has any plans to create a huge monitoring system, the current law under the RIPA (the Regulation of Investigatory Powers Act) allows hundreds of government agencies access to the records of every internet provider in the country.

In publicly announced proposals to extend these powers, firms will be asked to collect and store even more vast amounts of data, including from social networking sites such as Facebook.

If the plans go ahead, every internet user will be given a unique ID code and all their data will be stored in one place. Government agencies such as the police and security services will have access to the data should they request it with respect to criminal or terrorist investigations.

This is clearly the next step in an incremental program to implement an already exposed full scale big brother spy system designed to completely obliterate privacy, a fundamental right under Article 8 of the European Convention on Human Rights.

Similar efforts to place restrictions on the internet are unfolding in Australia where the government is implementing a mandatory and wide-ranging internet filter modeled on that of the Communist Chinese government.

Australian communication minister Stephen Conroy said the government would be the final arbiter on what sites would be blacklisted under "refused classification."

The official justification for the filter is to block child pornography, however, as the watchdog group Electronic Frontiers Australia has pointed out, the law will also allow the government to block any website it desires while the pornographers can relatively easily skirt around the filters.

Earlier this year, the Wikileaks website published a leaked secret list of sites slated to be blocked by Australia's state-sponsored parental filter.

The list revealed that blacklisted sites included "online poker sites, YouTube links, regular gay and straight porn sites, Wikipedia entries, euthanasia sites, websites of fringe religions such as satanic sites, fetish sites, Christian sites, the website of a tour operator and even a Queensland dentist."

The filter will even block web-based games deemed unsuitable for anyone over the age of fifteen, according to the Australian government.

The broad attack on the free internet is not only restricted to the UK and Australia.

The European Union, Finland, Denmark, Germany and other countries in Europe have all proposed blocking or limiting access to the internet and using filters like those used in Iran, Syria, China, and other repressive regimes.

In 2008 in the U.S., The Motion Picture Association of America asked president Obama to introduce laws that would allow the federal government to effectively spy on the entire Internet, establishing a system where being accused of copyright infringement would result in loss of your Internet connection.

In 2009 the Cybersecurity Act was introduced, proposing to allow the federal government to tap into any digital aspect of every citizen's information without a warrant. Banking, business and medical records would be wide open to inspection, as well as personal instant message and e mail communications.

The legislation, introduced by Senators John Rockefeller (D-W. Va.) and Olympia Snowe (R-Maine) in April, gives the president the ability to "declare a cybersecurity emergency" and shut down or limit Internet traffic in any "critical" information network "in the interest of national security." The bill does not define a critical information network or a cybersecurity emergency. That definition would be left to the president, according to a Mother Jones report.

During a hearing on the bill, Senator John Rockefeller betrayed the true intent behind the legislation when he stated, "Would it have been better if we'd have never invented the Internet," while fearmongering about cyber attacks on the U.S. government and how the country could be shut down.

Watch the clip below.

The Obama White House has also sought a private contractor to "crawl and archive" data such as comments, tag lines, e-mail, audio and video from any place online where the White House "maintains a presence" – for a period of up to eight years.

Obama has also proposed scaling back a long-standing ban on tracking how people use government Internet sites with "cookies" and other technologies.

Recent disclosures under the Freedom Of Information Act also reveal that the federal government has several contracts with social media outlets such as Youtube (Google), Facebook, Myspace and Flickr (Yahoo) that waive rules on monitoring users and permit companies to track visitors to government web sites for advertising purposes.

The U.S. military also has some $30 Billion invested in it's own mastering the internet projects.

We have extensively covered efforts to scrap the internet as we know it and move toward a greatly restricted "internet 2" system. All of the above represents stepping stones toward the realisation of that agenda.

The free internet is under attack the world over, only by exposing the true intentions of our governments to restrict the flow of data can we defeat such efforts and preserve the last vestige of independent information.

Take Control of Your Health

Joseph Mercola

New Doubt Cast on True Cause of Deaths in 1918-19 Flu Pandemic

Dr. Joseph Mercola, 8 April 2010

https://web.archive.org/web/20100613225124/http://www.theflucase.com/index.php?option=com_content&view=article&id=3235%3Anew-doubt-cast-on-true-cause-of-deaths-in-1918-19-flu-pandemic-by-dr-mercola&catid=1%3Alatest-news&Itemid=64&lang=en

A researcher who authored one of the first articles connecting aspirin to Reye's Syndrome, a lethal disease that attacks the liver and brain, is suggesting that aspirin also could be to blame for a significant portion of deaths in the 1918-1919 influenza pandemic.

In an article in Clinical Infectious Diseases, California internist Dr. Karen M. Starko talks about the high doses of aspirin that were used to treat fever and the aches and pains of the early 20th century flu.

The symptoms of aspirin overdoses, she says, may have been difficult to distinguish from those of the flu, especially among those who died shortly after they became ill.

This information is particularly relevant today, not only because CDC officials are pushing for people to get the H1N1 shot before they go on spring break, but also because they have now decided that H1N1 will be part of the seasonal flu shot scheduled for the 2010-11 flu season.

They also have expanded the flu shot schedule to include the elderly and infants 6 months of age and older.

Dr. Mercola's Comments:

No one will ever know whether aspirin therapy was actually a culprit in the deaths of the 1918 pandemic. But the history lesson is important, especially since the 1918 pandemic is being used as a benchmark to fuel flu fears today.

Even as world health officials sit with egg on their faces, pondering why the 2009 H1N1 swine flu proved not to be the pandemic they predicted, they still insist people get vaccinated, even though the flu season is mostly over. And in a sky-is-falling move, they've also decided to include H1N1 in the seasonal flu vaccines for 2010-2011.

I have already commented on the hyped-up H1N1 numbers that the US was reporting during the "height" of this non-pandemic. The lid was blown off by CBS investigative reporter Sharyl Attkisson, who revealed that the vast majority of *"swine flu" cases were not H1N1 at all - but, rather, some sort of respiratory infection.*

In other words, it was flu-like-symptoms – not flu of ANY kind – that was making people sick during the so-called H1n1 "pandemic." The reason H1N1 numbers were so high was because the CDC had instructed health care officials to stop testing for H1N1, and just presume that everyone who showed up with flu-like symptoms was infected with H1N1.

It was a great game plan. Only it didn't work because some health officials tested anyway, and found out the truth.

Finally, a few weeks ago in February, after months of waiting for the hundreds of thousands of H1N1 deaths that didn't come, the World Health Organization admitted to Business Week magazine that "the overwhelming expression of [H1N1] was mild," and that they were going to use the pandemic-that-wasn't as a learning tool.

Apparently, what they learned is that, like it or not, H1N1 is going to be part of your flu shot package from now on.

History, Big Pharma, and the Flu

Before I talk about what the new flu shot recommendations mean let's go back to that 1918 flu, and look at how a pharmaceutical company may have contributed to countless deaths.

As Dr. Starko's research shows, some doubts about the causes of the 1918 flu deaths that were raised at the time. At least one pathologist thought that the amount of lung damage seen during autopsies was too little to attribute to viral pneumonia (a complication of the flu), and that the large amounts of bloody, watery liquid in the lungs must have had some other cause.

Without autopsy reports or other documents, Dr. Starko cannot definitively prove that aspirin was that other cause, but aspirin overdose stands out because the symptoms of aspirin overdose are similar to what that turn-of-the-century pathologist observed, she writes.

It also fits historically. Back then, aspirin was a fairly new drug, and its maker, Bayer, was advertising it heavily. Since aspirin packages had no warnings on them, and came with little or no instructions on dosages. All people really knew was that they could take this drug and feel better quickly.

So at the time people were taking large doses of Bayer aspirin. As Dr. Starko notes, when the flu popped up in late 1917 in Europe, the US Surgeon General and the US Navy began recommending aspirin to help alleviate flu symptoms for soldiers. Then, as the flu moved to the US, civilians followed suit.

With encouragement from the respected Journal of the American Medical Association, people downed 1,000-milligram doses of the drug every three hours, which today is the equivalent of downing 25 standard 325 milligram tablets in a 24-hour period.

The recommendations for this aspirin flu therapy came from government and health officials just before the October 1918 flu death spike, Dr. Starko says.

This level of high aspirin dosage is now known to, in some cases, cause toxicity and build-up of fluid in the lungs, which Dr. Starko theorizes may have contributed to the incidence and severity of symptoms, bacterial infections, and mortality, back then.

History Repeating Itself?

Anyone who has a child probably already knows that you're not supposed to give aspirin to sick children, because of the possible risk of Reyes Syndrome, a serious disease that can cause swelling in the liver and brain.

Reyes Syndrome most often affects children and teenagers, but it also can affect adults -- and when was the last time your health care provider told you not to give aspirin to your teenager, or not to take aspirin yourself when you are sick?

Since many people grab the aspirin bottle first when they're not feeling up to par, it's possible that more than a few people this past fall and winter did just that when they felt a cold or flu symptoms coming on.

It just makes me wonder if, like the 1918 flu, aspirin could have been partly to blame for all the "flu-like symptoms" reported to health officials during this past flu season?

Like the 1918 flu, it's a question that we'll never know the answer to. But it is a good reminder not to take aspirin for cold or flu symptoms.

Spring Break and Next Fall: Recycling the Leftovers

In the meantime, with flu season mostly over, and with plenty of unused H1N1 vaccine left on their shelves, the CDC has partnered with the American College Health Association to encourage students, faculty, and staff at colleges and universities to get vaccinated against the H1N1 flu virus for spring break.

Saying that the 2009 H1N1"pandemic" will continue for weeks, the CDC is urging the college crowd to get vaccinated right away.

At the same time the college letters came out, the CDC began predicting "a wave of flu activity" yet to come nationwide, and possibly even worldwide, even though the flu season is mostly over. On its website, it also warned that additional flu waves may come as late as May, with sporadic cases throughout the summer.

Anticipating that maybe this time the CDC and the WHO are correct – that H1N1 will hang around to become a pandemic later -- the Advisory Committee on Immunization Practices (ACIP) announced a provisional, updated recommendation regarding H1N1 vaccination on its website. For the upcoming 2010-2011 flu season, the ACIP says, H1N1 will be part of a trivalent shot that includes two regular flu viruses, along with H1N1.

Another important change for the coming year is that no one older than 6 months is exempt from flu shots anymore – the new rules state that everyone, including all children ages 6 months and up, as well as the elderly, should get flu shots from now on.

And watch out, senior citizens, because if you get this vaccine you'll be getting a quadruple hit. Posted March 2, the ACIP says:

A higher dose formulation of an inactivated seasonal influenza vaccine (Fluzone High-Dose, manufactured by Sanofi Pasteur, licensed by FDA on December 23, 2009) for use in people age 65 years and older will be available in the 2010-11 influenza season.

Fluzone High-Dose contains four times the amount of influenza antigen compared to other inactivated seasonal influenza vaccines.

Fluzone High-Dose vaccine in one study of people age 65 years and older produced higher antibody levels, but slightly higher frequency of local reactions.

Studies are underway to assess the relative effectiveness of Fluzone High-Dose compared to standard dose inactivated influenza vaccine, but results from those studies will not be available before the 2010-11 influenza season.

I added the boldface type to the ACIP's notice, to call attention to what our government health officials are recommending for senior citizens, some of whom may be in fragile health already: FOUR times the amount of antigen, of which the studies WILL NOT BE AVAILABLE before the vaccines are given.

This means that, once again, the public is being asked to be the guinea pig for a drug company's final clinical trial.

One More Time, the Evidence Shows Flu Shots Don't Work

Aside from the fact that a new Cochrane Systematic Review says that there is poor evidence that influenza vaccines work in the elderly, and that there is little or no evidence that they even work at all, a different study shows that flu vaccines don't work in children either.

This study, published in the October 2008 issues of JAMA and JAMA's Archives of Pediatrics & Adolescent Medicine, looked at children younger than age 5 who were seen in hospitals, emergency rooms or physicians' offices during the 2003-2004 and 2004-2005 flu seasons.

It found that use of the influenza vaccine was NOT associated with preventing hospitalizations or reducing visits to their pediatricians. I commented on this study when it first came out. But in case you missed it, here's what the study showed:

"Significant influenza vaccine effectiveness could not be demonstrated for any season, age or setting after adjusting for county, sex, insurance, chronic conditions recommended for influenza vaccination and timing of influenza."

The authors speculated that vaccinated children in this study got the flu anyway, because the vaccines for those years did not contain the actual flu virus that was going around – something that can happen in any year, since world health officials and manufacturers have to guess ahead of time which flu might be the predominant one in an upcoming year.

And finally, for more proof that there's no evidence that flu vaccines work, then why not hear it straight from the horse's mouth – the vaccine manufacturers themselves. For example, here are excerpts from the actual package inserts of the four flu vaccines that the CDC and ACIP are recommending for this coming fall:

- Fluzone High-Dose: There have been no controlled clinical studies demonstrating a decrease in influenza disease after vaccination with Fluzone High-Dose.
- Agriflu: No controlled efficacy trials have been performed to indicate a decrease in influenza disease after vaccination with AGRIFLU.

- Afluria: There have been no controlled clinical studies demonstrating a decrease in influenza disease after vaccination with AFLURIA.
- Fluarix: Specific levels of hemagglutination-inhibition (HI) antibody titer post-vaccination with inactivated influenza virus vaccines have not been correlated with protection from influenza illness but the HI antibody titers have been used as a measure of vaccine activity.

While Fluarix's wording is technical, it essentially is saying the same thing as the others: no clinical trials have been done to prove that these vaccines will keep you from getting the flu -- the only thing they have to go on is a measurement of antibodies to the specific flu virus in the blood of trial subjects.

And even then, it's anybody's guess whether the vaccine actually will protect you from the flu - just like that children's trial published in JAMA proved.

Compelling Evidence Not to Opt for the H1N1 Shot

If that's not enough to make you wonder why the CDC continues to come out almost daily with more flu warnings, more flu advisories, and more flu shot recommendations, then consider this little tidbit that came out just a couple weeks ago:

According to Science Daily: "New research from Tel Aviv University bacteria expert Prof. Eshel Ben-Jacob of the Raymond and Beverly Sackler School of Physics and Astronomy, grounded in the study of bacteria, presents compelling evidence to suggest there may be good reasons why most people should not automatically opt for the swine flu H1N1 shot."

The scientists used the mannerisms of the bacteria themselves to explain why people should not be so eager to jump on a new vaccine bandwagon.

"The simple rule we learned from bacteria is that anybody who has to make an important decision -- especially one of life and death at times of stress -- should wait to see the trend of changes, process the risks and odds in depth, and only then decide," says Prof. Ben-Jacob.

Proof that Vitamin D is the Best Flu 'Vaccine' Around

I couldn't have said it better myself. But I saved the best for last. For years now, I've been talking about how important vitamin D is to your overall good health, and how it can help you in warding off illnesses like the flu.

I've cited numerous studies supporting my stand on vitamin D, but this one, published March 10, 2010 in the American Journal of Clinical Nutrition, is a new one that reinforces everything I've ever said about what vitamin D can do.

In this first-ever, rigorously designed, randomized, double-blind, placebo-controlled trial on the topic, researchers investigated the effect of Vitamin D3 supplements on the incidence of seasonal influenza A in schoolchildren.

The study is recent, done from December 2008 to March 2009. What these researchers found was astounding, but not surprising: that vitamin D3 supplementation during the winter may reduce the incidence of influenza A, especially in specific subgroups of schoolchildren.

It was particularly noticeable in children with a previous diagnosis of asthma, the researchers said. In the children taking the supplements, asthma attacks as a secondary outcome of the flu were one-sixth of what they were in children not taking the supplements.

I'm thrilled that, finally, a clinical trial proves what I've been saying all along – that it's a good idea to take a natural nutrient in the form of vitamin D to help you stay healthy. Do the benefit/risk equation yourself when you compare natural vitamin D supplementation with vaccines manufactured with destructive chemicals, preservatives and adjuvants.

I'm sure this is something that the flu vaccine makers aren't going to like. I'm also certain you're not going to read about it on the CDC's website, even though, as I wrote about in this previous article, they should have already noticed that a majority of children who died this season of H1N1 had diseases associated with vitamin D deficiency.

The good news is, the information is out there, and more and more health officials are beginning to take notice, including the Canadian government which, as I wrote about last year, is also studying vitamin D's effect on the flu.

Ольга Четверикова

ММСП 2005 как административный инструмент ВОЗ
За фасадом ВОЗ.
Рокфеллер, Гейтс и заговор большой фармы против человечества

М.: Книжный мир, 2021
http://flibusta.site/b/641447/read#n_179

Глава 9. ММСП 2005 – как административный инструмент ВОЗ

Чтобы лучше понять, каким образом «Большая фарма» и финансовые игроки использует ВОЗ в своих интересах, в качестве механизма реализации своей политики, надо проследить, как изменялись полномочия и возможности ВОЗ в качестве международной организации.

Напомним, что в соответствии с ст. 21 Устава ВОЗ Ассамблея здравоохранения ВОЗ имеет полномочия устанавливать права, касающиеся санитарных и карантинных требований, номенклатур болезней, стандартов диагностических методов исследования и пр. При этом в ст. 22 говорится, что «правила, принимаемые в соответствии со ст. 21, становятся обязательными для всех членов после того, как будет сделано должным образом оповещение об их принятии Ассамблеей здравоохранения, за исключением тех членов Организации, которые известят генерального директора в указанный в оповещении срок об отклонении их или оговорках в отношении них».[168]

Таким образом, правила, установленные ВОЗ, не носят автоматически обязательного или приказного характера, и принятие или отклонение их зависит от согласия самих государств-членов.

Проводит в жизнь решения Ассамблеи Исполнительный комитет, который может, в соответствии со ст. 28 (i) «в пределах круга ведения и финансовых возможностей принимать чрезвычайные меры в случаях, требующих немедленных действий. В частности, он может уполномочить Генерального директора принимать необходимые меры по борьбе с эпидемиями, принимать участие в организации медицинской помощи жертвам народных бедствий» и пр.

С 1969 г. действовали Международные медико-санитарные правила (ММСП), обеспечивавшие мониторинг и контроль 6 серьёзных инфекционных заболеваний: холеры, чумы, жёлтой лихорадки, оспы, возвратного тифа и эпидемического тифа. Но при этом только 3 болезни подлежали международной регистрации, при которой государства должны были уведомить ВОЗ о появлении этих болезней на своей территории: это холера, чума и жёлтая лихорадка.

Однако в связи с тем, что в начале 90-х годов в условиях обострения общей геополитической обстановки вновь стали распространяться такие болезни, как холера и чума, а также появились новые инфекционные заболевания (лихорадка Эбола), ВОЗ приняла в 1995 г. на своей 48 сессии резолюцию о пересмотре ММСП. В качестве аргументов, обосновавших необходимость пересмотра, были приведены зависимость от официальной системы уведомления об этих болезнях и отсутствие формального и международного скоординированного механизма для предотвращения их распространения.

В итоге 23 мая 2005 г. на 58 сессии ВОЗ были приняты новые *Международные медико-санитарные правила* (**ММСП**), вступившие в силу в 2007 г. и ставшие одним из базовых документов, регламентирующих деятельность этой организации.[169]

ММСП представляют собой международный договор (закон), устанавливающий глобальные правила в области общественного здравоохранения с целью усиления медико-санитарной безопасности на национальном, региональном и международном уровнях. Его цель – предупредить международное распространение болезней, проводя профилактические и противоэпидемические мероприятия. Они нацелены на укрепление коллективной защиты здоровья населения от многочисленных и разнообразных рисков в современном глобализированном мире, которые могут быстро распространяться в глобальном масштабе в результате увеличивающихся объёмов международных поездок и торговли. Руководство работой ВОЗ по координации осуществления ММСП ведет Департамент по глобальному потенциалу в области предупреждения о вспышках болезней и ответных действий.

Этот договор расширил возможности и полномочия ВОЗ и его генерального директора и стал инструментом, играющим ключевую роль в обеспечении глобальной безопасности в области здравоохранения.[170]

Основные изменения, внесённые в ММСП, заключаются в следующем.

МММСП расширяют масштаб правил и охватывают теперь существующие, новые и вновь возникающие болезни, включая острые патологические состояния, вызванные неинфекционными болезнетворными агентами. В силу новой правовой основы ММСП обеспечивают быстрый сбор информации, общее понимание того, что могут представлять собой *чрезвычайные ситуации в области общественного здравоохранения, имеющие международное значение* (**ЧСОЗМЗ**), а также возможность оказания странам международной помощи.

...

Таким образом, Гендиректор ВОЗ получает, как мы уже указывали, очень большие полномочия, и с учётом крайне размытых критериев для объявления ЧСЗМЗ и определяющего значения теневых механизмов и личного влияния всё это открывает неограниченные возможности для произвола.

Что касается правового статуса ММСП, то, в соответствии с Уставом ВОЗ, они автоматически становятся обязательными для всех государств-членов ВОЗ, если они активно и в течение ограниченного периода времени не заявили о своём несогласии с ММСП. Однако ни одно государство-член ВОЗ не вышло полностью из-под действия этих Правил, и только две страны сделали по ним определённые оговорки.

Одна – это Индия, сделавшая оговорку по поводу распространения на её территории жёлтой лихорадки. А вторая – это США, которые оставили за собой право принять обязательства по ММСП в форме, совместимой с её фундаментальными принципами федерализма. То есть правила эти будут выполняться Федеральным правительством или правительствами штатов в соответствии с конституцией, и в той степени, в какой обязательства подпадают под правовую юрисдикцию правительства штатов, Федеральное правительство представит такие обязательства вниманию соответствующих властей штатов.

...

И одновременно государства приобретают **следующие обязанности**, среди которых, в частности:

– назначение национального координатора по ММСП;

– проведение оценки событий, происходящих на их территории, и оповещение ВОЗ о всех событиях, которые могут представлять собой ЧСОЗМЗ;

– ответ на запросы, касающиеся проверки информации относительно событий, которые могут представлять собой ЧСОЗМЗ;

– направление в ВОЗ любых фактических данных об идентифицированных за пределами их территории рисках для здоровья населения, которые могут вызвать международное распространение болезни;

– применения усилий для проведения рекомендуемых мер;

– сотрудничество с другими государствами-участниками и ВОЗ в целях выполнения ММСП (2005 г.).

Соответственно новые функции и обязанности приобретает и ВОЗ ...

...

Согласно ММСП (2005 г.), ВОЗ следует в обязательном порядке уведомлять обо всех случаях следующих четырёх болезней: оспа, полиомиелит, вызванный диким полиовирусом, тяжёлый острый респираторный синдром (ТОРС) и человеческий грипп, вызванный новым подтипом вируса.

Одновременно с ММСП ВОЗ в том же году разработала шкалу, включавшую 6 «фаз предупреждений о вероятности пандемии» для гриппа и новых разновидностей гриппа:

1 фаза – низкий уровень риска заражения;

2 фаза – значительный риск заражения;

3 фаза – «случаи инфицирования человека новой разновидностью гриппа»;

4 фаза – передача вируса от человека к человеку ограничивается редкими случаями;

5 фаза – хотя «вирус всё еще не является в полной мере заразным, появляется значительный риск возникновения пандемии»;

6 фаза – соответствует периоду пандемии.

Таким образом, как мы видим, ММСП превратились в эффективный инструмент влияния ВОЗ, которая приобрела исключительные полномочия объявлять чрезвычайные ситуации в области глобального здравоохранения. После этого началась подготовка к большой пандемии гриппа.

Репетиции большой пандемии

За фасадом ВОЗ.

Рокфеллер, Гейтс и заговор большой фармы против человечества

М.: Книжный мир, 2021

http://flibusta.site/b/641447/read#n_179

Глава 10. Репетиции большой пандемии

Всем понятно, чем выгодна пандемия компаниям «Большой фармы», и как они на ней зарабатывают. Но тут есть ещё важный момент, который становится главным. Пандемия даёт фармкомпаниям возможность создать новую бизнес-модель, которая позволяет им работать без рисков и постоянно наращивать свою прибыль. Речь идёт не о лечении, а о предотвра-

щении и профилактике болезней с помощью вакцинации. Но продвижению вакцинации препятствуют два фактора. Первый связан с принципом её добровольности, сохраняющимся в большинстве стран. А второй – с тем, что вакцинация против определённых видов заболеваний ведёт к появлению устойчивого иммунитета на всю жизнь к этим болезням и делает ненужной её повторение, что приносит фармкомпаниям первоначальный доход, который затем неуклонно снижается.

Решить эти проблемы можно следующим образом. Во-первых, сделать вакцинацию обязательной, напугав людей настолько, чтобы они приняли её как единственное спасение, и подстраховавшись соответствующими нормативно-правовыми актами. Во-вторых, вакцинировать от тех «вирусов», от которых невозможно получить устойчивый иммунитет в силу того, что они постоянно мутируют. Такими вирусами являются «вирусы» ОРВИ или гриппа.[174]

Именно к возможной пандемии гриппа и стала готовиться ВОЗ ещё с конца 90-х годов.

В 1999 г. она выпустила первый в своей истории документ, в котором говорилось о грядущей пандемии гриппа и который назывался *«План подготовки к пандемии гриппа: роль ВОЗ и руководство для национального и регионального планирования».*[175] Он был подготовлен рядом учёных в сотрудничестве с европейской научной рабочей группой по гриппу (ESWI), играющей центральную роль в обеспечении связей ВОЗ с исследовательскими европейскими институтами.[176] Поскольку эта группа спонсируется компаниями «Большой фармы», она находится под их влиянием. Среди них Roche, Sanof Pasteur, Novartis, GlaxoSmithKline, Astra Zeneca, Baxter и др. В состав группы тогда входили профессор К. Николсон из Лестерского университета в Великобритании и профессор А. Остерхауз из Университета Эразма в Нидерландах, участвовавшие в разработке препарата «Тамифлю» компании Roche. Последний был председателем исполкома ESWI. И показательно, что в том же году лекарство «Тамифлю» было выведено на рынок США вместе с другим препаратом, «Реленза» компании Glaxo Wellcome, вошедшей затем в состав GlaxoSmithKline.

В 2002 г. в штаб-квартире ВОЗ в Женеве прошла встреча экспертов по гриппу, на которой присутствовали представители фармкомпаний Roche и Aventis Pasteur и материалы которой вошли в *«Руководство по использованию вакцин и противовирусных препаратов во время пандемии гриппа»,* опубликованное ВОЗ в 2004 г.[177] А приложение к руководству с рекомендациями по использованию этих препаратов было написано Ф. Хайденом из Виргинского университета, получавшим деньги за лекции и консультации компании Roche и GlaxoSmithKline. В нём рекомендовалось всем странам иметь большой запас противовирусных препаратов на случай пандемии. Авторами других приложений (по вакцинации в условиях пандемии и по пандемическому гриппу) были учёные А. Монто из Мичиганского университета и К. Николсон, которые также получали гонорары за консультации и помощь в проведении исследований Roche, GlaxoSmithKline (GSK) и ViroPharma, Wyeth, Chiron и Berna Biotech.[178]

Для внесения определённой ясности по поводу пандемии гриппа ВОЗ в 2003 г. на своей странице «Готовность к пандемии» дала такую информацию: «Пандемия гриппа возникает, когда появляется новый вирус гриппа, против которого у человеческого населения нет исходного иммунитета, *что приводит к нескольким одновременным эпидемиям по всему миру с огромным числом умерших и заболевших*. С ростом глобального транспорта и коммуникаций, а также урбанизацией и перенаселённостью, эпидемии, вызванные новым вирусом гриппа, вероятно, быстро распространятся по всему миру».[179]

В те же годы в США была разработана программа тотального карантина для населения, которую инициировал тогдашний министр обороны Джон Рамсфелд (2001–2006). Вряд ли было совпадением то, что в 1997–2001 гг. он возглавлял американскую биотехнологическую компанию Gilead Sciences, занимающуюся исследованиями, разработкой и коммерциализацией низкомолекулярных противовирусных препаратов, и именно у неё в 1996 г. купила лицензию на производство «Тамифлю» компания Roche. Став министром, Рамсфелд оставил за собой большой пакет акций компании.[180]

При Рамсфелде и Буше-младшем военное руководство активно изучало возможность противодействия атакам с использованием биологического оружия против американских военных, дислоцированных за пределами страны. В 2005 г. Министерство обороны и Служба охраны здоровья США предложили определённую методику карантина, которая превращала военные базы в объекты, недоступные для ликвидации с помощью биологического оружия. Военные базы США должны были быть превращены в закрытые города, способные выдержать длительную осаду и в которых можно без проблем прожить несколько месяцев. Для этого всех больных солдат необходимо изолировать в госпиталях, а для здоровых ввести казарменный режим с запретом покидать базы. Поскольку в представлении неоконсерваторов террористами являются все иностранные граждане, а у тех нет возможности проникнуть в расположения американских военных, базы будут защищены.[181][182]

Такую же методику Рамсфелд распорядился распространить на всё население США. То есть, в случае широкого применения биологического оружия тотальный карантин, который вначале собирались задействовать только на базах, должен был быть введён и для гражданских лиц. Разработать соответствующий план было поручено доктору К. Мехеру и доктору Р. Дж. Хэтчетту из Совета национальной безопасности, которые осуществили это в 2006 г. в Центрах по контролю и профилактике заболеваний (*Centers for Disease Control and Prevention* – CDC), представляющих собой федеральное агентство министерства здравоохранения США.[183]

План этот предполагал и введение социального дистанцирования как меры немедикаментозного вмешательства при борьбе с эпидемиями, которая впервые была широко применена в период средневековья. Озвучена эта идея была в Национальной стратегии по борьбе с пандемическим гриппом 2006 г., в которой говорилось: «Меры по защите границ и прекращению транспортировок будут наиболее эффективны для замедления пандемии, если они являются частью более масштабной стратегии, которая включает в себя другие виды вмешательства, такие, как меры по борьбе с инфекцией и гигиена рук и правила кашля, социальное дистанцирование, изоляция, вакцинация и лечение антивирусными препаратами». Как указал по этому поводу один из исследователей, «одна из закрытых сторон коронавирусного кризиса – это то, что идея, родившаяся из просьбы президента Буша-младшего по обеспечению лучшей готовности нации к следующей вспышке заразной болезни, стала сердцем национального руководства по ответу на пандемию»[184].

Надо отметить, что когда Мехер и Хэтчетт представили свой план, высокие чиновники, привыкшие опираться на фарминдустрию с её препаратами, встретили это предложение со скепсисом и насмешкой, поскольку оно рассматривалось как невыполнимое. Никто не мог представить, что эта идея будет доведена до абсурда и станет реальностью.

Однако тут важно подчеркнуть, что программа Рамсфелда рассматривалась им не столько как борьба против локальной эпидемии, сколько как инструмент реализации политического глобального плана, с помощью которого можно будет перестроить всю финансовую и социально-экономическую систему мира. Всемирная всеобщая самоизоляция приведёт к перестройке всего мирового сообщества и перераспределению задач по регионам, запустит ещё большую специализацию глобальной экономики, в результате которой США оставят себе главный сектор. Зоны, не интегрированные в глобальную экономику, должны быть лишены государственных институтов власти и превращены в простые резервуары природных ресурсов. Достаточно развитые зоны (в числе которых ЕС, Россия и Китай) будут ответственны за производство товаров широкого потребления, а производство вооружений для армии и полиции во всём мире будут обеспечивать только США.

Похожие идеи разрабатывались в Американском институте предпринимательства группой «Проект нового американского века». Но с этим связана и доктрина глобального разделения труда, именуемая доктрина Цебровски.[185]

А. К. Цебровски – вице-адмирал ВМС США, специалист по сетевым войнам, сторонник глобальной перестройки, предполагающей перераспределение производительных сил в пользу США, разрушение ряда производств и переориентацию промышленности в пользу вооруже-

ний и внедрение тотального электронного контроля над населением через мобильные телефоны. Главная ответственность за напряжённость в мире при этом возлагается на Китай, что требует его наказания и переустройства мира. Существует и ещё один важный пункт: переключение неявного финансирования СМИ, с интересов нефтяных на интересы фармацевтических компаний.

Таким образом, идея «всеобщей обязательной изоляции», предложенная 15 лет назад администрацией Буша, была изначально направлена не на обеспечение здоровья людей, а на милитаризацию американского общества на случай биологической атаки и для введения непрерывного управления, сметающего всю существующую официальную власть в США.

Тогда эта идея вызвала бурю протестов, которые возглавил профессор Дональд Хендерсон, руководивший одновременно Школой медицины при университете Джона Хопкинса и американской системой реагирования на эпидемии. Он оценил эти планы как окончательное скатывание администрации к тоталитаризму, приведшему к принятию «Патриотического акта» после теракта 11 сентября, и нарушение Конвенции о защите прав человека и основных свобод.[186] В 2017 г. при Трампе все официальные документы, в которых упоминались указанные меры, были уничтожены, а Ричард Хэтчетт стал директором Коалиции за инновации по предупреждению эпидемий (CEPI), которая координирует деятельность по разработке новых вакцин (к ней мы ещё вернёмся).

Однако инструкции были готовы и ждали своего часа. Так же, как уже были приняты новые международные медико-санитарные правила (ММСП), которые должны были вступить в силу в 2007 г.

Показательно, что разработка указанного плана и новых ММСП совпала по времени со вспышкой так называемого птичьего гриппа (H5N1), который начал распространяться ещё в конце 2004 г. Большую роль в пропаганде идеи о смертельной опасности этого гриппа сыграл уже упомянутый А. Остерхауз. До этого он способствовал раскручиванию паники по поводу атипичной пневмонии 2003 г., но эта тема уже была неактуальна и исчезла из поля зрения общественности, так что он перенёс своё внимание на новую болезнь.

Ещё в 1997 г. Остерхауз начал бить тревогу в связи со смертями в Гонконге нескольких человек, которые имели прямой контакт с птицами. Тогда он перешёл к продвижению в европейских правительствах утверждения о новой смертельной мутации птичьего гриппа, который передаётся людям. В своём интервью BBC о новой опасности в октябре 2005 г. он заявил, что «если вирус на самом деле мутировал таким образом, что он теперь может передаваться от человека к человеку, то мы имеем совершенно иную ситуацию, мы, возможно, стоим на пороге пандемии». Вирус так и не смог мутировать, но Остерхауз уже тогда был готов делать эксперименты, причём за огромные деньги.[187]

В декабре 2004 г. на сайте ВОЗ появилась информация, что распространение гриппа H5N1 может спровоцировать пандемию, характеристики которой предсказать невозможно, но это может затронуть от 20 % до 50 % всего населения. Указывалось, что большая часть мира не готова к пандемии и даже при самых оптимальных её сценариях от 2 до 7 млн человек умрут, а десятки миллионов потребуют медицинской помощи. Такую же цифру оглашал тогдашний руководитель программы ВОЗ по борьбе с гриппом, немецкий вирусолог и эпидемиолог Клаус Штёр. В связи с этим ВОЗ, подчеркнув, что глобальное распространение пандемии невозможно остановить, но надо снизить её воздействие, рекомендовала накапливать запасы противовирусных препаратов и вакцин и работать над продвижением разработки вакцин против пандемических вирусов[188].

В ответ на это многие правительства стали закупать большие объёмы лекарств «Тамифлю» и «Реленза», которые позиционировали как наиболее успешные в борьбе против гриппа. Особенно мощная кампания была развязана в США. О том, что страна должна быть готова к тому, что перелётные птицы, заражённые вирусом, доберутся до неё в течение последующих

нескольких месяцев, заявил, в частности, глава Министерства внутренней безопасности Майкл Чертофф. По инициативе Буша-младшего американский конгресс, напуганный гипотетическими последствиями гриппа (с возможным летальным исходом от 200 тыс. до 2 млн человек), выделил на борьбу с ним 7,1 млрд. долл., из которых 2 млрд. пошло на закупку 20 млн. доз «Тамифлю». Массовые закупки США поддержали правительства Великобритании, Японии, Израиля и других государств, в результате чего Roche заработала от продажи лекарства более миллиарда швейцарских франков.[189] Что же касается Рамсфелда, то на пике страхов относительно угрозы эпидемии он удачно продал часть своих акций, получив чистую прибыль в 5 млн долл.[190]

Однако опасность птичьего гриппа оказалась не просто преувеличенной, но фальшивой, вместо прогнозируемых 7 млн человек жертвами гриппа оказались 400. Штёр, сыгравший решающую роль в принятой тогда стратегии ВОЗ, покинул эту организацию, заняв высокую должность в фармацевтической компании Novartis.

Волна массовых человеческих смертей не стала реальностью, но Roche и GSK уже вложили миллиарды долларов в производство неэффективных и опасных препаратов в надежде на государственные закупки в огромных масштабах. Поэтому не успела закончиться вспышка птичьего гриппа, как близкие к ВОЗ и Большой фарме учёные-медики стали предупреждать о возможной новой пандемии гриппа, подобного вирусу H1N1, который может иметь страшные последствия.[191] Так, в 2006 г. группа исследователи из Гарварда опубликовала в журнале «The Lancet» свои прогнозы о возможной гибели 62 млн человек, а оценка советника министра здравоохранения и социальных служб США профессора Остерхольма была ещё более драматичной – от 180 до 360 млн. погибших.[192] Активное участие в этой информационной кампании принимал всё тот же А. Остерхауз, прозванный «Доктором Гриппом».

В итоге, когда в марте 2009 г. из небольшой деревни Ла-Глория в мексиканском штате Веракрус пришло сообщение о заболевании, которому дали название «свиной грипп»,[193] а затем подобные случаи были зафиксированы в США, пропагандистский аппарат ВОЗ с непристойной поспешностью стал нагнетать обстановку.[194] 24 апреля ВОЗ выпускает первое сообщение о вспышке болезни по данному вопросу, подтверждающее инфицирование людей в Мексике и США «вирусами свиного гриппа A/ H1N1… ранее не обнаруживавшихся среди свиней или людей», а 25 апреля она собрала Чрезвычайный комитет (ЧК), по совету которого гендиректор объявил ЧСЗМЗ, а в США начинается Неделя вакцинаций. 27 апреля после заседания ЧК ВОЗ поднимает уровень предупреждения о пандемии до 4-й фазы, а 29 апреля – до 5-й. Как заявила тогда гендиректор ВОЗ Маргарет Чен, все страны должны немедленно активировать свои планы по обеспечению готовности к пандемии. Во многих странах был введён масочный режим, учебные заведения закрывались, запрещены были массовые гуляния.

Однако для объявления пандемии оснований не было, так как не было «огромного числа умерших и заболевших» (критерий ВОЗ). Более того, сама М. Чан отметила тогда после жарких дебатов внутри ВОЗ, что «на сегодняшний день подавляющее большинство пациентов испытывает лёгкие симптомы и достигает быстрого и полного восстановления, часто в отсутствие какого-либо медицинского лечения» и что «во всём мире число смертей мало» и они не ожидают «увидеть внезапного и резкого всплеска числа серьёзных или смертельных инфекций».[195]

Но 4 мая на сайте CNN появляется статья, в которой профессор охраны окружающей среды Бостонского университета Д. Озонофф заявил, что слово «пандемия» не так страшно, как кажется, и что оно относится к тому, насколько широко распространена болезнь, а не к тому, насколько она серьёзна и сколько от неё умерло людей. В связи с этим один из репортёров CNN отметил несоответствие между этим утверждением и определением, данным на сайте ВОЗ. На что, в свою очередь, тут же ответила пресс-секретарь ВОЗ Натали Буду, заявившая, что определение ВОЗ было ошибочно и что оно удалено. Аргументировано это было тем, что определение было дано давно, оно рисует довольно мрачную картину и внушает страх. В итоге появилось «правильное определение», заключающееся в том, что «пандемия»

не имеет никакого отношения к тяжести заболеваний или числу смертей и означает вспышки новых заболеваний по крайней мере в двух из 6 регионов, на которые ВОЗ делит мир.[196]

Позже пресс-секретарь ВОЗ Г. Хартл в интервью медицинскому сайту *Medscape* вообще заявил, что старое определение пандемии было только описанием, а не официальным определением: «Это не определение, но мы признаём, что оно могло быть так воспринято. Мы виноваты в путанице между определениями и описаниями». Это подтвердила и гендиректор Ч. Мон, заявившая, что старое определение пандемии было неофициальным.[197] И уже 11 июня ВОЗ заявила о 6 фазе, объявив, таким образом, впервые о пандемии гриппа.[198]

А чуть позже она ввела изменения в требования к отчётности по вирусной инфекции пандемического гриппа. Сославшись на то, что пандемия распространяется с беспрецедентной скоростью и что странам становится сложно или невозможно проверять и подтверждать эти случаи путём лабораторного тестирования, ВОЗ отменила выпуск глобальных таблиц с количеством подтверждённых случаев заболевания во всех странах. После чего точное число заболевших и умерших установить стало невозможно. Так, в США, по оценкам CDC, за год пандемии диапазон заболеваний составил от 43,4 до 89,3 млн человек, а диапазон умерших – от 8,8 до 18,3 тысяч.[199]

Что же касается числа умерших от свиного гриппа в мире в целом, то если по данным CDC оно составило от 151 до 575 тысяч,[200] то по данным ВОЗ – 18449 человек (при 491,3 тысячах подтверждённых лабораторно случаях заболевания).[201]

Для лечения ВОЗ рекомендовала всё те же «Тамифлю» и «Релензу», которые стали закупаться в огромных объёмах: 85 стран закупили 220 млн упаковок «Тамифлю» на сумму около 18 млрд. долл. (в России продажи препарата в 2009 г. выросли на 1000 %). То же самое произошло с вакцинами.

А в то время директором Инициативы ВОЗ по исследованию вакцин была д-р М.-П. Кини, которая до 1988 г. работала в биотехнологической компании Transgene SA, имевшей стратегические партнёрские отношения по производству вакцин с компанией Roche. До прихода в ВОЗ Кини также принимала активное участие в европейской инициативе по вакцинам (European Vaccine Iniciative – EVI),[202] которая представляет собой ведущее европейское некоммерческое партнёрство, занимающееся разработкой вакцин, клиническими исследованиями и подготовкой учёных из стран с низким и средним уровнем доходов.

Его учредителями стали Стокгольмский и Гейдельбергский университеты, а членами:
– Центр биомедицинских исследований приматов (Рейсвейк, Нидерланды);
– Гейдельбергский университет (Гейдельберг, Германия);
– Фонд вакцин Дженнер (Оксфорд, Великобритания);
– Институт Пастера (Париж), и
– Королевский колледж хирургов в Ирландии (Дублин).

А донорами партнёрства являются ВОЗ, ЕС, Коалиция по инновациям в обеспечении готовности к эпидемиям (CEPI), Партнёрство по клиническим исследованиям в Европе и развивающихся странах (EDCTP), Глобальный фонд инновационных технологий здравоохранения (GHIT), Инициатива по инновационным лекарственным средствам (IMI), Nobelpharma Co., Ltd., Специальная программа исследований и обучения тропических болезней ВОЗ, SAP, а также агентства и департаменты министерств иностранных дел Дании, Нидерландов, Ирландии, Швеции и др.[203] Все эти структуры активно продвигают новые вакцины.

В итоге вакцинацией оказались охвачены миллионы людей. Через ВОЗ в страны, не имевшие собственного производства вакцины, было поставлено около 78 млн доз. В США было вакцинировано около 75 млн. человек (25 % населения), в Канаде 13,5-15 млн. человек (40–45 %), а в Финляндии – всё население.[204]

Однако и в данном случае опасность гриппа была сильно преувеличена. Так, одна только Германия заказала лекарств и вакцин от гриппа на сумму 450 млн евро, но волна заражения в

стране была относительно лёгкой, а число смертей (258 смертей на 226 000 больных) оказалось меньше, чем обычная эпидемия сезонного гриппа. В итоге государственные запасы, оплаченные за счёт налоговых средств, из-за отсутствия спроса пришлось уничтожить. Великобритания первоначально подписала контракты о закупке 120 млн. доз вакцин, но из-за низкого числа заболевших было закуплено всего 44 млн. доз., причём из них к апрелю 2010 г. было использовано только 6 млн, а 3,8 млн. было передано структурам ВОЗ в Африке.[205]

Как выяснилось позже, по подсчёты банка JP Morgan, продажа вакцин должна была принести фармацевтическим компаниям дополнительную прибыль порядка 7,5-10 млрд долл. Ещё в 2005 году фармацевтические компании обязались держать свои лаборатории наготове и провести исследования, чтобы при необходимости приступить к быстрому производству вакцины против птичьего гриппа, а правительства при этом заверили, что закупят всё. В результате этой сделки фармацевтическая промышленность ничем не рисковала. Когда же встал вопрос о вакцине против свиного гриппа, компании потребовали, чтобы правительства выполнили свои обязательства. В результате последние закупили вакцины, но использовано их было всего 13–25 %, так что никто не знал, что делать с оставшимися закупленными препаратами.[206] Огромное количество вакцин и лекарств пришлось просто уничтожать в связи с истечением срока годности.

Когда так называемая пандемия пошла на спад, в адрес ВОЗ стало звучать всё больше критики. В связи со сложившейся ситуацией в декабре 2009 г. председатель комитета по здравоохранения ПАСЕ, немецкий врач и эпидемиолог Вольфганг Водарг подал ходатайство о вынесении рекомендации под названием *«Фальшивые пандемии – угроза здоровью»,* подписанное ещё 13 депутатами ПАСЕ.

В ходатайстве утверждалось, что с целью продвижения своих лекарств и вакцин фармкомпании повлияли на учёных и официальные структуры, ответственные за стандарты в области здравоохранения, которые подали сигнал тревоги правительствам всего мира. Пандемические кампании птичьего и свиного гриппа нанесли большой ущерб не только некоторым вакцинированным пациентам и бюджетам общественного здравоохранения, но и доверию и подотчётности международных учреждений здравоохранения, в связи с чем необходимо расследование их последствий на национальном и европейском уровнях.[207]

В январе 2010 г. в ПАСЕ впервые прошли слушания о роли ВОЗ в преувеличении опасности свиного гриппа и сговоре с фармацевтическими компаниями о необходимости вакцинации. На нём выступил с докладом один из авторов ходатайства П. Флинн, подчеркнувший, что общественность должна знать, как на самом деле принимаются решения о пандемии, поскольку есть убедительные доказательства того, что серьёзность пандемии была сильно преувеличена ВОЗ, а программа вакцинации была на самом деле «применением плацебо в громадных масштабах».

О том же говорил Водарг, назвавший историю со свиным гриппом «одним из крупнейших медицинских скандалов века» и обвинивший фармацевтические лаборатории в организации психоза вокруг него. Он подчеркнул, что изменение ВОЗ статуса пандемии позволило фармацевтическим компаниям «превратить эту возможность в звонкую монету посредством контрактов, которые в основном были тайными». В целом из-за решений ВОЗ борьба с эпидемией обошлась мировому сообществу в 18 млрд долл. Водарг также обвинил ВОЗ в использовании при разработке вакцин вещества, влияние которых на здоровье человека было недостаточно изученным. В итоге миллионы людей оказались привиты без каких-либо оснований, и неизвестно имеет ли вакцина позитивный эффект, так как она не была клинически протестирована. Вывод Водарга был однозначен: «ВОЗ предприняла непонятные меры, которые не могут быть оправданы научными фактами. Совет Европы должен провести расследование в отношении опасных действий ВОЗ».[208]

Водарг назвал историю с пандемией «одним из крупнейших медицинских скандалов века» и обвинил фармацевтические лаборатории в организации психоза пандемии, что является следствием «кровосмесительных связей между ВОЗ и фармацевтической промышленностью», позволяющих заработать фармкомпаниям на продаже вакцин.[209]

По итогам слушаний ПАСЕ в июне 2010 г. подавляющим большинством голосов приняла резолюцию № 1749 и рекомендацию № 1929, в которых говорилось о необходимости большей открытости ВОЗ.

Между тем самым серьёзным исследованием, посвящённым связям ВОЗ с фармацевтическими компаниями и их сговору о пандемии, стала статья журналистов Д. Коэн и Ф. Картера, опубликованная в «Британском медицинском журнале» (BMJ) в июне 2010 г. и носящая характерное название *«ВОЗ и «теории заговора» в связи с пандемическим гриппом».*[210] Название стало ответом на слова гендиректора ВОЗ М. Чан, заявившей, что все обвинения в фальшивости пандемии являются конспирологическими теориями. Авторы доказывают, что учёные, дававшие советы ВОЗ по планированию действий во время пандемии, выполняли оплачиваемую работу для фармацевтических компаний, которым были выгодны подготавливаемые рекомендации, но, естественно, об этом конфликте интересов ВОЗ никогда публично не заявляла. Среди них, в частности, доктор Дж. Вуд, работавший с противогриппозными вакцинами по договорам с Sanof Pasteur, CSL, IFPMA, Novartis и Powdermed; профессор А. Монто, консультировавший по гриппу компании GSK, Novartis, Roche, Baxter и Sanof, получавший от них соответствующие гонорары и, будучи членом Чрезвычайного комитета, принимавший решение об объявлении пандемии. Кстати, имена членов Чрезвычайного комитета не раскрывались вплоть до окончания пандемии, о которой было объявлено 10 августе 2010 г.

Руководство ВОЗ не могло проигнорировать критику в свой адрес, но реакция на неё была очень своеобразной. Оно отказалось от прежней шестифазной шкалы «предупреждений о вероятности пандемии», приняв решение, что в случае резкого ухудшения эпидемиологической обстановки будет объявлять ЧСЗМЗ, которая теперь может иметь три класса последствий: 1-й класс – минимальные, 2-й класс – умеренные и 3 класс – значительные.[211] Понятно, что данное положение открыло ещё больше возможностей для произвола в решении данного вопроса.

После этого и до появления COVID-19 ВОЗ 4 раза объявляла о ЧСЗМЗ – по поводу полиомиелита и лихорадки Эбола в Западной Африке в 2014 г., по поводу эпидемии лихорадки Зика в 2015–2016 г. и по поводу продолжающейся лихорадки Эбола в Киву в 2018 г.[212]

Что же касается пандемии, то с 24 февраля 2010 г. на сайте ВОЗ она определена следующим образом: «Пандемия – это распространение нового заболевания в мировых масштабах. Пандемия гриппа происходит, когда появляется новый вирус гриппа и распространяется по всему миру, и большинство людей не обладают иммунитетом».[213] То есть тяжесть заболевания для ВОЗ и высокие показатели смертности больше не являются критерием пандемии, хотя этот подход и вызывает решительную критику специалистов. А в сознании людей это слово ассоциируется именно с масштабным бедствием. Совершив такую подмену, ВОЗ приобрела возможность бесконтрольно манипулировать этим термином.

193. Примечательно то, что симптомы имели смысл с точки зрения близости от одной из крупнейших свиноферм в мире, находящейся в La Gloria и принадлежащей компании Smithfeld Farms из США. Местные жители несколько месяцев пикетировали управление компании Smithfeld Farms в Мексике с жалобами на проблемы с дыханием, связанные с огромным количеством свиного навоза в резервуарах рядом с фермой. Но реальные причины заболевания в La Gloria, по-видимому, не интересовали Остерхауза и его коллег-консультантов ВОЗ. Долгожданная «пандемия», предсказанная Остерхаузом еще во времена «эпидемии» атипичной пневмонии в китайской провинции Гуандун в 2003 году, теперь, наконец, случилась.

An explanation, why this chapter was published

In the beginning of this research, it was found that many of the previously published articles on the Swine Flu Pandemic (2009-2010) were no longer available due to a change in internet address, or when switching to a new internet platform, or due to the supposed loss of their relevance, etc.

Therefore, an attempt was made to restore the lost information in order to be able to research the events related to the swine flu pandemic.

Most of the lost articles that disappeared from the original sites were found on the archive.org site, but some articles were preserved on third-party sites.

The following are examples of the articles that were not available on the original site or on the archive.org site.
